A four-year record in Comanche County, Texas, shows the scholarship of the club boys and girls to be 11 per cent above those who do not belong to a club. Of the 4000 boys and girls in rural schools in the county, not one expelled or suspended was a club member. The superintendents agree that club members are more active, have more inspiration to do better work and possess the desire to search for new things. Very few club members stop school in the lower grades, and those not of their own choice.

WINDOWS OF THE HOME

Henry Van Dyke calls the pictures on his walls the windows of his home. Through them he gets glimpses of the beauty which lies beyond the section of living space bounded by the stone walls of his city home. Through one such window he could see the ocean, and almost feel the cold spray and the strength of the salt air. Another window gave him a view of the mountains, with all of the uplift of a daily climb, in thought, to their summits.

The influence of such silent teachers in the home can hardly be estimated, but in nothing else is the average American home so poorly furnished. Good taste may be displayed in the choice of carpets and easy chairs. Wall paper may be selected in quiet restful tints, but the decorations may be family portraits framed in objectionable ornate mouldings, chromos, representations of Indians in gaudy war paint, or so-called oil paintings, purchased perhaps of some itinerant vendor and suggestive of nothing in the heavens above or the earth beneath.

DON'T FORGET THE BIRTHDAYS

Do not drop the habit of observing birthdays. The observance need not require much extra time or effort, but do let the day be a little different, the dinner a trifle festive, the honored member of the family placed, on a pedestal, so to speak. If you plan some little surprise for the children on their birthdays, let all but the honored one help toward that surprise, and when your own birthday draws near give them a free hand toward doing a little something unexpected for you, and let all of you work together to make Dad forget his cares for the holiday meal of his natal day.

USE GOOD RUBBERS IN CANNING

It is very important in canning that new, good, rubber rings be selected. Test them for elasticity by pulling. They should not break easily and should return to shape. When doubled between the fingers the rubber should not crack or even show little holes. When placed on the jar the ring should fit closely. Do not select rings by color, but by test. Do not use the same rubber twice. It is cheaper to buy new rubbers than to lose a jar of fruits or vegetables.

Grease stain on white clothes is easily removed by soaking the spot in ammonia, letting it dry, then washing in hot soapsuds.

Make generous use of those best bleaching agents; sunshine and green grass.

You Can Buy An "Inexpensive" Piano Without Buying a "Cheap" One

There is a big distinction between the words "cheap" and "inexpensive." Some folks like to get things "cheap"—only to find that in the end they proved to be the most expensive—because a little while afterwards they had to buy another that would really give service.
Now we do not sell "cheap" pianos, but we do carry a number of "inexpensive" instruments. The prices are within the reach of most every home. These Pianos will render many years of satisfactory service—they are good, substantial values and are worth every dollar asked. We gladly arrange convenient terms of payment.

We invite you to call at any of our stores—or write us asking for illustrated catalog and prices.

We are dealers in Steinway and other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, etc.

The Improved Caledonian Riding Bean Harvester

The Caledonian is without doubt the best bean harvester ever used in California. Mounted on steel wheels it requires less power, it does better and faster work than a sled type and will outlast two sleds—a considerable saving. It has a three lever adjustment. All parts in stock, including extra blades.

HAY

Under date of August 16, Scott, Magner & Miller says:
Receipts past week 2818 tons. Most of this hay arrived from the bay and river sections by boat, arrivals by rail being lighter than they have been for years at this season.
Cars have been very difficult to obtain in most sections and box cars are practically unobtainable, gondola equipment being about all that is offered by the company. This, as we stated last week, causes a very unsatisfactory condition of affairs as such equipment cannot be used where tunnels have to be traversed, and many points that are in the market for hay cannot be served. Demand from country districts has been very good although much dissatisfaction exists among buyers at delay of shipments owing to the car situation. Yet as a whole the market can be summed up as good at prevailing prices.
Hay has been moved from the tracks and boats here fairly well and although not as rapidly as the preceding week yet with good despatch. No demand for straw, with large offerings.
We quote today wholesale prices in carload lots for old hay as appear from dealers' transfers upon the hay market—for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat hay (light 5-wire bales)	17.50@19.00
No. 1 Wheat or Wheat and Oat hay	15.00@18.00
No. 2 Wheat or Wheat and Oat hay	12.00@15.00
Choice Tame Oat hay	15.00@18.00
Other Tame Oat hay	12.00@15.00
Wild Oat hay	10.00@14.00
Barley hay	12.00@16.00
Alfalfa hay	17.00@22.00
Stock hay	9.00@12.00
No. 1 Barley straw, bale	50@80

Citrus Markets

Los Angeles, August 20, 1919.
Valencias are getting well cleaned up though the market has been somewhat affected by large receipts of Eastern grown summer fruits. Fear of a general strike has delayed some shipments.
Lemons are in good demand but going forward in limited quantities. Prices generally satisfactory.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California: Oranges, 30,554 cars, lemons, 8706, total 39,260. To same date last season; oranges, 12,997, lemons 5004, total 18,001. Central California this season; oranges 4427, lemons 354, total 4781. To same date last season; oranges, 2539, lemons 115, total 2654. Northern California; oranges, 244, lemons 2, total 246. Last year same date; oranges, 203.

MARKET NOTES

Prune and apricot growers of the Santa Clara Valley have been looking into the question of insurance of their crops against weather damage. As yet the rates offered by insurance companies are too high to be practicable.
Standards under which beans will be bought and sold have been established by the California Bean Dealers' Association. This for Choice Recleaned and No. 1 Recleaned; lower grades on sample or description.
Foreign demand for dried fruits has slowed up, partly because most of the supply is contracted for and partly because of the great decline in foreign exchange.
Prices on almonds will be announced by the California Almond Growers' Exchange about September 10. Meantime price made by outside factors on Nonparells has already been advanced one cent, basis price now standing at 36 cents.
Walnut prices are usually made by the Exchange some time around the first of October.
Cantaloupe shipments from Central California were reduced last week, due to temporary car shortage. Complications of diseases have produced very short yields this season.
There is a large increase in celery plantings in Sacramento County.
Estimates are that approximately 2500 cars of onions are still available in the state, of which 1000 cars will go into storage. This would leave 1500 cars to move, or, at the present rate of movement, eight weeks' supply. Unless Eastern crops prove larger than now estimated this means increasing prices.
California expects to market nearly 3000 cars of watermelons.

SYSTEMS OF FEEDING POULTRY

There are two systems in use for the feeding of fowls, in one of which all the feed is given dry and in the other one or more of the daily feeds consists of a moistened mash. For convenience they may be termed the "dry feed" and the "mash" systems, although in the dry feed systems a dry mash is often fed. Dry feeding is used by many where it is not convenient to make and feed a moistened mash. The greatest advantages to be derived from the dry system are the saving of labor and the lessened danger of bowel trouble resulting from sloppy or soured mashes.

TiziT TiziT

Tizit Wins

Tizit Spray is rapidly gaining the distinction that its past performances and present effectiveness warrant. In the Claremont, California, district, it has been used for the past four years by many growers. Their groves are clean of the black scale and in fine condition. These growers are using Tizit now exclusively.

Owners of adjacent groves have fumigated for the past five years. Their groves are suffering from Black Scale as any one can see. One of them who has been watching the effects of Tizit on his neighbors' groves called the attention of the Inspector to the condition of his trees as compared with trees sprayed with Tizit.

The proof of the effectiveness of Tizit is on every hand. Being open minded and unbiased, the Inspector gave full credit to Tizit Spray and it was upon the inspector's recommendation and the conclusive evidence of what Tizit had accomplished in cleaning up the other groves, that this grower began using Tizit.

Growers who are not satisfied with results obtained by other methods of scale eradication cannot but see the uniformly beneficial effects of Tizit, which by the way is lower in price than any other scale eradicator—and we justly claim much more efficient.
Be sure you get the genuine TIZIT manufactured by

The Tizit Spray Mfg. Co.

1344 Willow St. Phone 12089 Los Angeles

Exchange members may be supplied through the Fruit Growers Supply Co.

Aggeler & Musser Seed Co.

620 S. Spring St., Los Angeles, California

Buy only Melilotus seed that has a quality tag on each sack. It protects you against the low germination seed so general on the market this season. This seed is above 99 per cent pure and above 90 per cent germination.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

Summer Feeding

By Jean A. Koethen

THE longer I work with chickens the more am I impressed by the fact that the hen, in her tastes and idiosyncrasies, in her needs and desires, is not essentially different from the rest of us. We like to breathe pure air at night (if we are educated up to it). So does the hen. Shade in hot weather, protection in cold, immunity from the annoyance of insect pests of whatever sort, room to exercise and do the thing we like to do, whether it be to scratch in leaves and straw, wallow in the dust or rush around the country in a noisy, puffing buzz-wagon, are requirements common to all of us two-leggers, feathered or not. In summer we like to let up a little on the heavy work of the year, to adopt a lighter ration and so prepare the system for the strain of continued and often excessive heat. Instead of ham and fried potatoes for breakfast, we ask for melon and a dish of peaches; at dinner salad is more palatable than roast. Not only do we prefer fruits and vegetables, but we are actually unable to digest food that would be easily cared for in cold weather.

The case of the hen is identical. She is helpless, to be sure, and must take what is given her, unless she is so fortunate as to be on range, but she wants greens just as much as we want fruit and salad, and if she is kept on the heavy winter laying ration without some adjustment to her needs she suffers sooner or later. The liver refuses to do its work, elimination is stopped, and some day the hen either drops off the roost, dead, or develops the purple comb and sluggish motion which indicate liver trouble.

Even more imperative is it that the male bird should have a change of diet during the summer. A laying hen may keep in condition in spite of a too heavy ration, because she is laying. The male bird has no other use for extra protein, and stores it up in fat. Economy demands that the number of males kept through the summer be reduced to those that are absolutely needed as breeders, but the few that are kept should be put as soon as they are out of the breeding pen upon a summer ration.

My attention has been called to this need of the male for special feeding by a letter from an Oildale subscriber. She writes:

"I have a very finely bred Barred Rock cockerel that is sick. The first I noticed was a weakness in the knees, and next day he could not stand at all. Now he prefers lying on his side or at least he kicks himself over that way, I suppose in trying to get up. His comb is a good red, although I notice the points are dark, almost black. He eats some, but not much, and does not drink much water. He is also molting. I took him away from all the hens in May, gave him a good clean yard with scratching pen, shade and dripping fresh water. He has had mill screenings to eat, consisting of about two-thirds wheat and one-third corn, oats and barley, then once a day a mash of bran and rolled barley with a mixture of meat scrap, bone meal, linseed meal and charcoal in it. I admit I am short of green stuff, but I gave him all I could get, and he has grit a plenty—I notice the droppings are rather green and watery. Today I see I have a hen that seems to be going the same way."

The description of this bird's condition corresponds quite closely with Dr. Kaupp's description of a bird affected with fatty degeneration of the liver. He says they "show varied symptoms, but ordinarily they are dull, eat little, and the comb turns dark to black. They gradually become thin in flesh and finally die. Usually the bird will live from two or three weeks to three months after the symptoms first appear. On autopsy all organs as a rule appear normal except the liver, which is smaller than normal, unless fatty infiltration is also present. It appears slightly yellowish and when cut through with a knife the blade of the instrument will have a greasy appearance, due to the fat that adheres to it." Of the cause of this condition, Dr. Kaupp says:

"Overfed hens, or those closely housed and not forced to work, or fed too heavily on carbohydrates (starchy feeds) store up much of the surplus nutrition in the liver as well as in other portions of the abdomen In the liver, in which excessive fat is stored up there is after a while an encroachment upon the protoplasm to such an extent that the cells cannot properly functionate, and then death of the bird may occur."

No Corn for Heavy Hens

In our climate Leghorns may be given some corn in winter, but hens of the heavy breeds should have very little, if any. In summer corn should not be fed to any breed. This is because corn is the most heating of all grains, and the fat which is not required for maintaining bodily heat must inevitably be stored up somewhere. It will be noticed that corn had been a part of the ration of this Barred Rock rooster as long as he would eat, though the Rock puts on fat more rapidly than most breeds. The proportion of meat and vegetable meals is not given, but from the fact that both meat scrap and linseed meal have been used, as well as bone meal, one is forced to conclude that the cockerel has had too much protein as well as too much fat. All the greens he could consume might have balanced the ration, but as he has had so little he could hardly escape clogging of the liver. The fact that one hen is beginning to exhibit the same symptoms shows the whole flock has been fed too heavily.

The first thing to do when liver disease is suspected is give the whole flock a dosing with Epsom salts. This helps to carry off the waste matter which is clogging the system. If there is already fatty degeneration, Dr. Kaupp says treatment is of little use, though podophyllin in one grain doses may be given every three days with some hope of relief. Where the disease has not advanced so far half a teaspoonful of Epsom salts to each hen, mixed in a small quantity of moist mash, may help to delay further development. More important than medicine is the addition of bulk to the mash. In summer it is always wise to double or treble the amount of bran in the mash, because bran is both bulky and laxative. In such a case as this it is a good plan to fill the hoppers with plain bran instead of the laying mash for a week or two, and then add meat scrap gradually, beginning with a very small amount.

Scarcity of green feed is a common trouble this summer. I know of no better substitute than sprouted oats or barley. Either grain soaked from 12 to 24 hours, then turned into a box where it can drain, covered with burlap, set in a shady place and kept moist, will begin to sprout in from three to five days. It is best fed as soon as the white sprouts begin to show, or at the latest as soon as the green is seen. A flock of heavy hens could get through the summer with no other grain than sprouted barley and find itself in excellent condition in the fall. There might be fewer eggs than when the heavy laying ration was kept before them and again there might be quite as many.

Bran with a little bone meal added (95 per cent bran and 5 per cent bone meal) is recommended by Professor Dougherty for pullets that are developing too rapidly through the summer. This maintenance mash is given in place of the laying mash wheu the pullets are from four and one-half to five and one-half months old and delays egg production while it builds up the body. Professor Dougherty claims that pullets fed in this way for six weeks will lay through the fall without molting though they are hatched in January or February.

It works all day—every day

The Mill Wheel turns as long as there is water in the chute. You *must* know that your tractor will "go" as long as there is fuel in the tank.

12 H. P. on Draw Bar

25 H. P. on Belt Pulley

THE HUBER Light Four

Draws three bottoms

Turns an acre an hour

is known for its dependable service. A steady stream of power flows from its mighty motor through all spur gear direct to the draw bar. Light tractor weight combined with great traction power; high wheels that roll easier and increase the amount of surface "grip"; center draft on all loads, preventing loss of power from side pull. The combination of all these—with a dozen other Huber features—makes the Light Four the last word in tractor dependability—and fuel economy, too.

Weight 5,000 pounds; pulls three 14" bottom plows; 12 h. p. delivered to the drawbar; 25 h. p. at the belt; Waukesha, four-cylinder motor; Perfex Radiator; Hyatt Roller Bearings; burns gasoline, kerosene or distillate; center draft; two speeds, 2½ and 4 miles per hour.

Write for "The Tractor in the Making", an interesting story of the development of the tractor as reflected in the successive models of the Huber for more than twenty years.

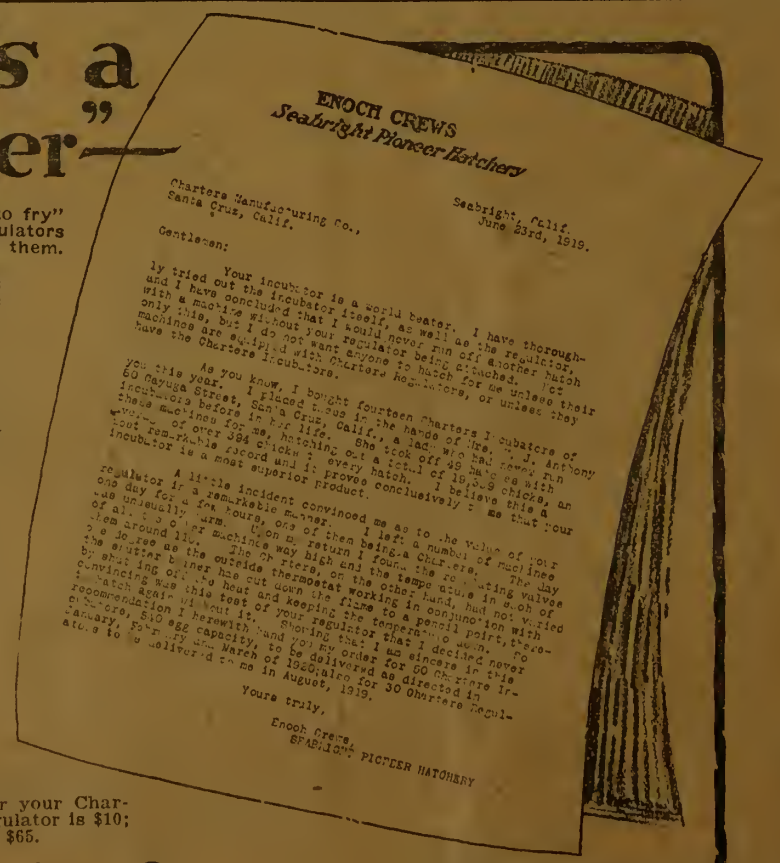
Some territory still open for live dealers

he says "it's a world beater"—

and the man who wrote this had no "fish to fry"—only eggs to hatch—and Charters Regulators and Incubators have helped him hatch them.

It will be worth your while to read the letter, reproduced here. Mr. Crews knows a lot about incubation—and his experience is worth hearing about.



ENOCH CREWS
Seabright Pioneer Hatchery

Seabright, Calif.
June 23rd, 1919.

Charters Manufacturing Co.,
Santa Cruz, Calif.

Gentlemen:

Your incubator is a world beater. I have thoroughly tried out the incubator itself, as well as the regulator, and I have concluded that I would never run off another hatch with a machine without your regulator being attached. Not only this, but I do not want anyone to hatch for me unless their machines are equipped with Charters Regulators, or unless they have the Charters incubators.

As you know, I bought fourteen Charters Incubators of you this year. I placed them as follows: One in the hands of Mrs. J. Anthony 60 Cayuga Street, Santa Cruz, Calif., a lady who had never run these machines before in her life. She took off 49 chicks, an every hatch. I believe this a wonderful record and it proves conclusively to me that your incubator is a most superior product.

A little incident convinced me as to the value of your regulator in a remarkable manner. I left a number of machines one day for a few hours, one of them being a Charters. The day was unusually warm. Upon my return I found the regulating valves of all the machines way high and the other machines in a pedal position, therefore allowing the outside thermostat working in conjunction with them around 110°. The Charters machine had not varied the slightest bit and keeping the flame to a pedal point, thereby shutting off the heat and keeping the temperature down. convincing me that your regulator is to be depended upon. recommendation I herewith hand you my order for 60 Charters Incubators, $10 egg capacity, to be delivered as directed in January, February and March of 1920. Also for 30 Charters Regulators to be delivered to me in August, 1919.

Yours truly,

Enoch Crews,
SEABRIGHT PIONEER HATCHERY

Charters Incubator

(equipped complete with Charters Regulators)

Dozens of other poultry raisers—with from one to over one hundred machines—have attached Charters Regulators, and had the same experience.

How the Regulator Works

It's the two thermostats that do the trick—actually anticipating any change of temperature, and automatically adjusting the size of the lamp flame to meet the new condition, and keeping the egg chamber the same, no matter what the weather. The outside atmosphere may vary 70 degrees, yet the egg chamber will change less than half a degree. With the Charters'—you will not need an incubator-cellar.

The big fuel tank—a unique feature of the Charters Regulator—holds a supply that will keep the lamp running from two to three weeks without refilling. This means only one refill and trimming during the entire hatch.

Write today for catalog—or, better, order your Charters now, in time for the fall hatch. The regulator is $10; the Incubator, with Regulator attached, is $65.

Charters Manufacturing Co.

1334 Soquel Ave.
SANTA CRUZ, CALIF.

Skilful Culling Pays Big Dividends

By J. E. Dougherty

EVERY poultry raiser fully understands that intelligent culling of the unprofitable layers will increase the average productiveness of the flock and increase the profits. But are you putting that knowledge into practice? Are you reaping the financial benefits of intelligent culling?

Culling Pointers

Between July 1 and October 1 is one of the best times to cull laying flocks. The sooner the better. Culling slacker hens saves feed.

A good layer should be active, be a good rustler, have a well developed comb for that particular breed, measure three fingers, two and one-half inches, or more from rear end of keel bone to ends of pubic or lay bones, have pubic bones that are fairly straight and rather thin for the age of the fowl, have pubic bones that are about the thickness of two fingers apart during laying season, have a rather full but soft and flexible abdomen and large, dilated vent during laying period, have pale beak and shanks at end of laying season, be of good size for the breed and well proportioned, molt late in fall.

A hen must have a healthy vigorous body to be able to lay heavily. Fowls with weak constitutions cannot stand up under the strain of heavy egg production.

A well developed comb of good color, short strong beak, blocky head, bright eye, well proportioned body and clean cut action are indications of a vigorous fowl.

The size of the comb, in relation to the normal size of comb for that breed, is correlated with a hen's egg laying ability so that the size of the comb is one indication of ability to lay. The larger the comb the better layer a hen should be, other points being equal. Abnormally large combs, however, are not desirable.

The better the layer the later she should molt. The molting of a fowl before September 1 is one indication of a rather poor layer.

Pubic bones should be thin, fairly straight, somewhat flexible in a pullet, but will tend to get thicker on ends and more rigid as hen gets older. Those hens, the ends of whose pubic bones thicken very slowly and so remain relatively thin from year to year should be better layers than hens whose pubic bones thicken rapidly on the ends, other points being equal. Therefore the relative straightness of the pubic bones and the relative thinness of the ends of these bones are valuable indications of egg laying capacity.

The distance between rear end of keel bone and ends of pubic bones is a measurement of abdominal capacity. Hens measuring less than the thickness of three fingers (two and one-half inches) between these points are usually culls as shown by other indications. Laying hens need good sized abdomens in which to manufacture a good yield of eggs per year.

During laying period, the distance between pubic bones increases to the thickness of two fingers or better to allow of free passage of egg. When laying stops, ends of public bones may come closer together again.

In laying period abdomen becomes fuller and vent more dilated due to stretching of the abdominal tissues to allow for the increase in size of the egg organs while actively functioning. The abdomen should, however, remain flexible to the touch. The accumulation of excess fat in abdomen crowds egg organs, interferes with and checks production and is indicated by abdomen losing its flexibility and becoming hard to the touch.

A hen in good laying condition should be in good flesh but not overfat as shown by a hard abdomen and a too plump breast.

In yellow shanked varieties like Leghorn, Ancona, Plymouth Rock, Rhode Island Red and Wyandotte, good layers "lay out" the yellow color in beak, earlobes, vent and shanks as laying season goes on so that the comparative shades of yellow of these parts in different fowls after July 1 is an excellent indication of the egg laying performance of these fowls. Pale shanks and beaks after July 1 indicate good layers whereas bright yellow shanks and beaks indicate culls.

The amount of yellow corn, kind and abundance of green stuff, etc., fed may affect rate of "laying out" of yellow color in different flocks because such feeds contain considerable yellow pigment. For this reason color comparisons should be made of individuals in same flock and fed in same way and not between birds in different flocks and fed differently.

For full details on yellow color as an indicator of egg laying ability send for a copy of California experiment station Circular 197 if you do not now have a copy.

The more different indications that are used in culling poor layers and selecting extra good layers the more accurate the work will be. Experience should soon enable one to cull laying flocks with surprising accuracy.

Are you getting that experience? Remember that skilful culling pays big dividends.

Farm bureau meetings in Santa Cruz County; Happy Valley, August 22; Soquel, 27.

RHODE ISLAND WHITES

Volume I. No. 1 of the Rhode Island White Bulletin is now issued by the club of which M. E. Bemis of Phoenix, Arizona, is the secretary. The first number gives itself principally to the answer to the question, "What are Rhode Island Whites?" The club makes a fine showing for this breed.

Poultry Queries

Conducted by J. A. Koethen

Chicks Dying

Can you tell me what is wrong with my young incubator chicks that seem to be all right until they are about six weeks old when they droop their wings, lose appetite and then die—Subscriber, Long Beach.

Your chickens may be the victims of red mites which hide in every coop that is not frequently disinfected with strong insecticide, or they may have coccidiosis, a digestive trouble which kills many chicks which are not properly fed and brooded, and sometimes gets into well cared for flocks. If the droppings are loose and bloody, you can safely conclude that coccidiosis is in the flock. If the droppings seem normal, go for your coops. The only cure for coccidiosis is sour milk or buttermilk kept before the chicks constantly. In order to get them to drink as much of this as they should have, it is necessary to cut down their ration, keeping the mash away from them most of the day, and giving only a little grain till there is improvement. Whether there are bloody droppings or not, your coops and houses should be washed out frequently with the hose, and painted or sprayed with some cresol preparation or crude carbolic acid and kerosene, using one part carbolic acid to eight or ten of kerosene. A neighbor of mine, who has a splendid flock of show birds came to me one morning last May in great distress over her chickens. They were all, old and young, standing around with drooping wings, and several had died. Other flocks she knew of were affected the same way. What mysterious disease was attacking them? I took one look at her drooping birds and said, "Put them in a temporary shelter somewhere and don't let them go back into the coops till you have cleaned and washed them and painted them with kerosene and carbolic acid," She took my advice, which is more than some people do, I fear, and in a short time the birds were over their mysterious attack.

The Motor Truck a Farmer Would Build

IF FARMERS pooled their ideas for building a practical motor truck that would best serve their everyday hauling needs, it would offer nothing not now found in the International Motor Trucks.

The reason is plain. The International is the result of a thorough knowledge of farm conditions. This Company knows country roads. Ample provision has been made to withstand the strain and stress of highways that place an unusual tax on parts subject to wear. Only the best materials are used, after thorough test. The truck is simple and durable.

International Motor Trucks

will do the work expected of them at a cost farmers can afford. They give a service that is reliable, prompt and economical in the severest test of all—**steady performance in actual daily use.** They have ample power for any emergency and can be depended upon to keep going every day in the year.

Farmers everywhere find an International Motor Truck a source of profit from the outset. It saves time, labor and distance. Markets are brought to the door and better prices are possible for farm produce, which retains all its freshness. The item of return loads is an important one from the standpoints of both business and convenience.

There are four sizes of International Motor Trucks —1,500, 2,000, 3,000 and 4,000 pounds capacity, with bodies suitable for every kind of hauling.

We have a dealer, a branch house, or a service station somewhere near you, where the line can be seen, or we will send full information promptly if you will write us.

At the Fair

The thousands of cars parked at every big fair plainly indicate their important place in rural life.

They have become as necessary as telephones—*almost* as indispensable as binders, plows or harrows.

And because the dependable and economical operation of your car hinges so largely on tires, it pays to equip it with good tires.

—tires you *know* are good.

By the same token, it's good business to buy tires that are *exactly* suited to *your* car and *your* individual driving conditions.

There are five types of United States Tires—one for every need.

They're all good—all recognized leaders in their respective classes. All are built to give the utmost in service—to last and last and keep on lasting.

All contain the great strength developed by the long experience and extensive manufacturing facilities of the largest rubber company in the world.

It makes no difference what your driving conditions may be, the nearest United States Tire Sales and Service Depot Dealer can supply you with good tires that will *exactly* meet your needs.

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

This week's cover is a sort of composite picture of the best of California live stock, and a gratifying feature is that, with the exception of the two small upper corner pictures, all are of California herds, studs and flocks. They all suggest the growth of the pure bred live stock industry in this state and indicate the quality of live stock that will greet the thousands who visit the state fair.

LIVE STOCK PROGRESS

To those who believe that California is destined to be one of the great live stock states in the Union the past 12 months hold high satisfaction.

More real progress has been made in the past year than ever before. All breeds have set new marks and plans are being made now that indicate an even wider extension next year.

No fear need be felt that there is any indication of a boom or that the industry will expand too rapidly. The development in the past has not been in keeping with the actual needs of the state. California has been backward, and the present and future expansion will need to attain large portions to be up to the existing and certain continued demand. Enough has been accomplished by California breeders in competition with breeders in established live stock centers to indicate that California can produce live stock of a character and quality the equal of any.

Breeders can order their operations with the greatest confidence so long as they keep in mind the real essentials, which they seem disposed to do.

GREAT ASSET

The national forests, practically all west of the Rockies, net the federal government, from the sale of timber, pasture and water power, over $4,000,000 annually. As yet the returns from water power are much less than from timber or pasturage. This latter source will, however, materially increase its financial worth; pasturage may slightly with proper management; and the forests should be made to yield a greater amount of timber year by year. In fact, it is the effort of the federal government to so manage these national forests that the country's timber supply shall be maintained and even increased. Meantime there is a privilege in which all may be engaged, and that is "Watch our own smoke and prevent forest fires so far as possible."

TRUE COOPERATION

The California Walnut Growers' Association says: "A man's value to his community lies in his ability to think individually and to act collectively." Unfortunately, however, the ordinary producer who is just beginning to think of cooperation wants to reverse this plan. Lots of fellows have the idea that they are "surrendering their individuality" and giving up their own civic rights by the use of common sense in placing their business in the hands of a business manager.

May people of this type increase their value to the community by more individual thinking and more collective acting.

HOLSTEIN SCANDAL

The Holstein-Friesian Association has just made public a great scandal perpetrated by one Cole in an effort to make sensational seven day records. How extensive these fraudulent Cole records are is not known at this time. The case is most unfortunate as values on certain animals will be affected and the exposure may tend to discourage some breeders and cast reflection on the entire pure bred industry. On the other hand the expose can not but eventually be a good thing. No business is so dependent on the integrity of the individuals engaged as the pure bred live stock industry, and the very emphatic and right stand taken by the officers of the association is a forceful declaration that the business will be kept clean at all costs. Such a stand will establish confidence.

In the meantime Holstein breeders need feel no alarm over the case or lose faith in the value of tests. The breed is bigger than a few crooks, and official testing is a policy that will stand.

Steps should be taken to establish legal penalties for such frauds in keeping with the importance of the crime.

STATE FAIR

From a stripling exhibition of a few years ago the California state fair has attained proportions that entitle it to rank among the larger fairs of the country. While the growth in the past few years has been marked, there is little doubt but that the coming years will see continued development.

The state fair is the one big annual event by which to measure the development of the resources of California and is one of the most influential of the agencies employed toward education.

The one time fair built around horse races and a blatant midway has given way to a representative and educational exposition of all lines of activity.

The service the California state fair has rendered to the cause of agriculture and live stock advancement can in no way be estimated. Year after year it has been the means for establishing standards, practices and types. Year after year it has offered inspiration and encouragement to thousands.

California is a better state because of the state fair, and by holding to the traditions of the past and with eyes to the front and a determination to make each succeeding fair hold a larger part in the activities of the state the future greatness of California is assured.

READY FOR OPENING

Many of the exhibits at the coming state fair are already in place; the $300,000 building is just completed; the grounds are becoming more beautiful and better adapted to a thoroughly agricultural fair every year, the greatest of California's state fairs will be held within the next few days.

President Roeding and Secretary Paine, in fact, all the members of the board of directors, are on the job. At the close of the last fair Mr. Roeding took his stengrapher and went amongst the exhibitors and asked them to file their complaints, which were duly taken down and considered, and those complaints have formed the basis for the elimination of everything which lessens the effectiveness of the state fair for California's advancement. Chas. Paine has been on the job of managing the state fairs for a score of years. He knows the work and the needs of the exhibitors.

The Cultivator has a corps of contributors and camera men on the grounds, and its issue of September 13 will give items which will prove educational for those who are unable to get the greater advantage of being there in person.

THE STRIKE

Thousands of tons of fruits and other perishables are rotting in the freight yards of Los Angeles. This is due to a strike for higher wages, not on the part of the men of the steam railways, but on the part of the inter-urban lines of the Pacific Electric, and the steam railway people are striking "in sympathy." The strikers are having really an enjoyable time. The railway control is not worrying for the taxes paid by the people of the United States will be sufficient to cover the loss.

Meantime the fruit growers, the canners, the fruit handlers are suffering immediate loss and products which should add to the wealth of California will become fertilizer.

The time will come when somebody who is big enough will devise a scheme to prevent the awful waste of these strikes and we will all wonder why we were not sufficiently wise to formulate similar plans before.

* * *

We may add that because of the strike much of copy for articles and even copy for ads. (which breaks our hearts), all intended for this special number, is still on the road. This has been in part overcome by liberal use of telegraph service between here and Sacramento.

Los Angeles postal authorities are equal to the occasion and all outgoing mail is being handled. Mail to San Francisco and Northern California is sent via steamers and auto trucks are handling San Joaquin Valley, Central and Southern California points.

STANDARDIZE

Several county horticultural commissioners, acting as deputies of the state commission, are taking vigorous action in the enforcement of the fruit standardization law. This campaign has been so effective that it has resulted in the active support of the state finances by several violators of the law. Ten to 25 dollars seems to be the favorite amount of fine though it is rumored there will be a material increase for third and fourth offenses. In a recent issue of the weekly news letter from Director Hecke's office we note:

"A flagrant case was that of James S. Anderson of Scobel & Day, who was fined $20 for shipping pears already condemned as being infested with codling moth. Two Japs each forfeited $25 for deceptive packs, having "paraded" fine tempting tomatoes on top, when those on the bottom were worthless, except for making paste. In addition, the commissioner has compelled these Japs to repack 200 cases of tomatoes to comply with the law. Another flagrant case was that of a Greek vender, who contributed $25 for "slipping" the public codling moth worms concealed in pears. This particular offender had been warned several times on this same count."

If this good work continues it will increase California fruit's reputation or rather the reputation of the growers and packers. The quality of California's fruit has long been established; so also has been the fact that California fruit's quality is not always indicated by the top layer.

Let grower and shipper unite with the commissions in this good work and greater wealth will be ours.

The CALIFORNIA CULTIVATOR presents herewith its Annual State Fair issue, but owing to strike conditions in Southern California and no mail having reached this office from our San Francisco, Sacramento, New York or Chicago offices since Saturday, August 23, many columns of advertising scheduled for this issue had to be omitted. Therefore we apologize to those ordering space in this issue whose copy did not reach us in time. We regret also that owing to strike conditions a car of special paper which was ordered in plenty of time for this issue is tied up, making it necessary for us to draw on our reserve stock and to run only 72 pages, which, by the way, is the largest issue of a farm paper ever published in California.

The State Fair is a California institution, and it is with pride that the CALIFORNIA CULTIVATOR presents this issue. Material from all sections of the state is evidence of good faith shown the Cultivator by many firms and individuals who patronize our columns. The fidelity of the subscribers and the untiring efforts of our staff make it possible to issue the biggest and best farm paper in California.

Importance of Agricultural Expositions

By R. P. Royce

THE year 1919 can be set down as one of the most important in the history of live stock development in California. California is not the oldest state in the Union by any means; neither is it the youngest. In many ways this state stands at the undisputed top; in others only a few of the bottom rounds of the ladder have been scaled. From a live stock standpoint California has been a state of paradoxes. Favored with natural conditions not excelled anywhere for live stock production, ranked as one of the great live stock producing states, with thousands upon thousands of cattle and sheep ranging the hills and valley stretches, California, up to a comparatively recent time, bore the unique reputation of being the home of the best light horses and the poorest of all other classes of live stock. The tule-rooter hog and the Mexican steer claimed undisputed dominion over the best feed in the West, and only the fact that they ranged on abundant and nutritious feed enabled such renegades of the live stock world to show any sort of profit to the owners. But as time passed the old order changed, but only very slowly.

Naturally, the first class of live stock to be accorded any consideration, aside from the thoroughbred and standard-bred horses raised by the old time kings of the '49 days, was beef cattle. Here and there a few progressive range men started pure bred herds of beef cattle, Shorthorns almost exclusively; the names of Ashburner, Glide, Gibson, Murphy, Howard and Rush coming to mind more readily, with a few other cattlemen bringing out registered bulls for their own outfits. The work of those pioneers was uphill all the way, and the credit due them for blazing the trail will never be adequately recognized. But with such a start the progress made, if slow, was certain.

The next step in live stock development was in the dairy industry. Ordinarily marked improvement does not come until after beef cattle, sheep and hogs have held the field. Not so in California. About 30 years ago Frank Burke established a herd of Holsteins, and his work was followed up by the Mills' Estate, Pierce and Hotaling.

The dairy industry came in for considerable expansion, but neither the beef industry nor the dairy industry responded to development to anywhere near the extent justified by the natural conditions of the state. For years these two lines of animal husbandry just about held their own. Finally the dairy industry got under way. During the past ten years the progress made has been marvelous, and today California boasts of some of the top herds of America, and indeed the world. It has been conclusively proven that California can produce the superior of any dairy herd in the world, the world records held by California cows being the proof offered.

From time to time a few pure bred herds of hogs were started, but only a few, Elias Gallup down at Hanford, Murphy in Sacramento County, and Bassett being the pioneers.

The first big event from a live stock standpoint to shove industry ahead in this state was the Panama-Pacific International Exposition in 1915. Even the great plans for that show were interfered with, the foot and mouth epidemic cutting off the major portion of the Eastern exhibits. But the influence of the show was far reaching.

Following the exposition many new herds of swine were established, all herds coming in for a share.

Then one morning in December, 1916, the word came that two California bred and raised steers, shown by the University of California at the International Live Stock Exposition in Chicago, the world's greatest show, had won the two highest honors—grand champion and reserve grand champion. The influence of that exploit was tremendous. It was positive proof that California could produce the best in beef cattle as well as dairy cattle.

The following year California Berkshires made a clean sweep at the National Swine Show. Since that time events have happened fast.

During all the years of development the California state fair stood as one of the powerful factors for better agriculture and better live stock. Since 1854 this institution has served as a beacon light and a shrine for live stock breeders, and its influence on the live stock industry of California can in no way be estimated. Large credit must be given.

For a number of years it has been felt that there existed a real need for more big shows, shows that would feature live stock to an even greater extent than possible at Sacramento. It has long been the hope that some day events would so shape themselves that important shows would be held at San Francisco and Los Angeles. The supporters of the plan were firm in the belief that shows at both cities, as well as the state fair, would do more than any other factor to promote the development of enthusiasm for better live stock. Last year it appeared that the dream would become a reality. San Francisco and Los Angeles scheduled shows. Then came the flu, and the history of the two shows last year is well known. Los Angeles finally held hers, but San Francisco was forced to abandon the enterprise.

Such a misfortune overtaking an initial show might be expected to crush all enthusiasm, but not so in either city. Early this year plans were again started looking toward the rehabilitating of the unfortunate shows, and so determined were the promoters that every obstacle has been overcome, and nothing short of a recurrence of the flu will prevent the gates opening on time.

Three big shows in 1919! The culmination of years of planning and hope. What wonderful possibilities center about those shows! How will they affect the live stock development of this state? What inspiration will they hold out to all breeders and hundreds of men and women who will enter the business?

From the Oregon line to the Mexican border, from the Coast to the Sierras, there exists a quickened interest in better stock of all kinds. On all sides one can sense this interest, and it is certain that all that is needed to start a wide expansion of the industry is the inspiration these three fairs and live stock shows will provide.

During the past year more progress has been registered throughout the state than ever before. More men have made beginnings; several large herds have been started; more top animals have been produced and sold; more high class breeding animals have been brought to this state; more public sales have been held; more new records have been established than ever before. With all this enthusiasm sound to the core, because better live stock is sound, the year 1919 will occupy a large place in the future annals of our live stock affairs. After years of slow progress, the opening wedge has been started. The pure bred live stock industry of California is off to a flying start. Enough has been accomplished to indicate the possibilities. With unsurpassed natural conditions, knowledge of what can be done, enthusiasm for the work in hand and faith in the efficiency of better live stock, the future indeed looks bright.

Agricultural News Notes of the Pacific Coast

Northern California

Shasta County expects a 1200 ton crop of prunes.

Placer County has had several serious forest fires.

Oroville canneries have put out a heavy pack of peaches.

Placer County farm bureau fair opened August 25 at Roseville. It lasted four days.

Sutter County is sending 60 carloads of Tuscan cling peaches a day to the canneries.

Teachers of agriculture from seven states recently met in conference at the University Farm at Davis.

Arbuckle, Colusa County, is now harvesting Nonpareil and I. X. L. almonds. The crop will be heavy.

Arbuckle is harvesting almonds. Prices will probably be named by the association early in September.

Fruit growers of El Dorado County are making plans to erect a community dryer at Placerville.

There will be a fine exhibit of pigeons and rabbits at the Land Products Show at San Francisco.

San Francisco has ordered 18 carloads of government food supplies which will be sold at retail by the city.

The Live Oak center of the Sutter County farm bureau is showing two films depicting the value of good roads.

The annual fall conference of farm advisers and farm bureau presidents will be held at Berkeley the middle of October.

Irrigation was interrupted for several days in the Paradise district, Butte County, owing to the breaking of canals.

Farm owners recently met at Placerville, El Dorado County, to discuss means of putting irrigation water on their lands.

A tractor course is to be given at the University Farm at Davis September 16-25. Enrollment is limited to 180 students.

Farm Adviser Mills of Solano County is conducting demonstrations to show the value of distillate as a weed discourager.

The Chico district expects a 2000 ton almond crop valued at $1,000,000. Contracts are being made at as high as 30 cents a pound.

Susanville and Leavitt in Lassen County are contending for the establishment of the box factory of the Fruit Growers Supply Company.

The Cloverdale Reveille says that 10,000 tons of wine grapes have been shipped East but they are not called wine grapes any more—jelly grapes.

Sebastopol apple growers have seriously felt the car shortage. On one day recently they report 100 carloads packed and waiting for cars, with only 16 cars available.

Prune growers of the Healdsburg district of Sonoma County have agreed to pay $5 per ton to prune pickers who stay through the season, and $4.50 to temporary workers.

The annual meeting of tho Tehama County farm bureau will be held September 27 at Courtland Park, about nine miles southwest of Red Bluff. There will be free barbecued meats and coffee, and in the afternoon live stock judging demonstrations.

Central California

Clovis, Fresno County, now has 12 fruit packing plants.

The honey crop of Fresno County will be short this season.

Cantaloupe blight has struck the fields in Merced County.

The pack of apricots and peaches at Porterville canneries will amount to $700,000.

Fresno County has shipped out most of the Malaga crop that will be used as green fruit.

Farm bureau meetings will be held in Merced County at Merced Colony, August 25; El Nido, 27.

The Oakdale irrigation district is planning to buy a steam shovel to increase the size of its canals.

Santa Cruz County will ship out about 3000 carloads of apples this season mostly Newton Pippins.

Farmers of the district above Shasta, Kern County, are planning erection of a cooperative warehouse.

Many of the Turlock cantaloupe fields that it is thought were down and out are showing a good third setting.

C. R. Snyder, Selma, Fresno County inspector of apiaries, reports foul brood practically exterminated in the county.

Land owners of the Orange Blossom section of Fresno County have declared themselves in favor of the proposed Melones dam.

State dairy inspectors are waging a campaign against unsanitary dairies in Tulare County and a number of prosecutions have resulted.

Discovery of oil in Tulare County near the Tulare-Kern County line near Delano has sent up the price of land in the immediate section from $8 to $120 per acre.

Modesto butter is being canned and shipped across the Pacific to the Orient and South Sea countries. The plant is turning out about 13,000 pounds daily.

The onion crop is being harvested in the Delta district with fair yield, but strikes have curtailed the movement on account of transportation being tied up on the river.

But one complaint was made on assessments in Tulare County this year, resulting in a lowering of $2, although the board of supervisors had to sit as a board of equalization for 12 days, under the law.

The state has 6570 acres reported as planted to commercial onion crops and in addition 1700 acres in the Delta district contracted to seedsmen. Last year's planting to both commercial and seed crop was much larger.

Tomato fields in the Santa Clara Valley are not showing a normal growth. Diseases have been reported in various parts of the state. Fields in the Manteca district show spotted condition and do not promise heavy production.

The Poplar farm bureau conter will cooperate with the local grange in holding a community fair the middle of October. This promises to be a fair well worth attending. While it will not be large as most fairs go, it is being pulled off to stimulate interest in better crops and livo stock.

Southern California

Rialto grape growers are shipping table grapes.

Threshing of Blackeyes has started in Orange County.

Bean threshing has begun at Oxnard, Ventura County.

The new cannery at Camarillo has a pay roll of 175 people.

Beans generally are looking well near the coast; only fair in interior.

Imperial Valley has shipped out this season 7830 carloads of cantaloupes.

Unirrigated sugar beet crops are suffering seriously from lack of water.

California Bean Growers Association is demanding tariff protection for beans.

The navy department is to install a powerful wireless station at Point Hueneme.

The San Fernando Valley, Los Angeles County, estimates its peach crop at 20,000 tons.

Prof. E. C. Vorhies will take charge of the live stock exhibit at the Riverside Fair.

The cannery at Lankershim, Los Angeles County, is starting on a six weeks run on peaches.

Watermelon acreage in California is estimated by the bureau of crop estimates at 5530, with production of 2289 cars.

Apricot pits are selling at $40 a ton. Formerly these were all shipped to Germany, but are now processed in this country.

The Pomona-Spadra-Walnut farm bureau met at the Spadra school house August 22 to discuss work of squirrel eradication.

The Arlington cannery has begun work after being closed for three weeks following a fire which destroyed a portion of the plant.

Orange County reports its output of Limas will be not much more than a fourth of normal crop. The county produced last year 500,000 bags of Limas.

California had in cantaloupes this season about 25,000 acres, of which 14,000 to 15,000 were in Imperial Valley and 10,000 to 11,000 in the San Joaquin.

Ranchers of Victor Valley are suggesting the formation of an irrigation district under the state laws unless the United States reclamation project materializes very soon.

Orange County's crop of Lima beans it is thought will not be over one-fourth of normal; Blackeyes about 20 per cent. Orange County last year produced 500,00 bags of Limas.

The new Chino Walnut Growers Association has already signed up more than 1000 acres. The Chino walnut growers formerly marketed through the exchange at Walnut.

The property owners along the coast of Los Angeles and Orange Counties are opposing the application of the Los Alamitos Sugar Company for permission to run a waste water pipe line from their factory into the ocean.

A plan is being pushed for the formation of an organization of all citrus and deciduous fruit growers of Riverside and San Bernardino Counties. The purpose of the proposed organization is to provide a contral markoting bureau by which the crops of the members can be handled to better advantage.

The Coast and General

Apples are yielding well in Nevada.

Cotton picking is well under way in Arizona. A normal crop is expected.

The city of Phoenix has purchased $80,000 worth of army food, which will be sold to citizens.

The Western Fruit Jobbers Association will meet in annual session in San Francisco February 2-7.

Alfalfa seed threshing is now in progress near Yuma with indications of the best yield in several years.

All crops in northwestern Nevada have suffered greatly from scarcity of water.

In the Yuma section cotton picking is well under way with yields estimated at a bale and a half to the acre and better.

Drouth still persists in most sections of Idaho. Use of water is limited in all irrigation districts and in some there is pronounced shortage.

The first bale of long staple cotton for 1919 was brought to a Phoenix gin by R. B. Spanaland, who also had the honor of producing the first bale for 1918.

In Arizona wheat and oats promise heavy yields of hay and grain, and the condition of wheat, barley and oats is from fair to good in most parts of Nevada.

English buyers during the past week have purchased from Hood River apple growers 75,000 boxes of fruit at an average of $2.00 a box on three grades.

Las Cruces District of New Mexico will have 500 cars of cabbage and 1500 cars of cantaloupes with prospect of a very largely increased acreage next year.

In northern Arizona wheat and oats are coming on splendidly and promise heavy yields both of hay and grain. In the dry farming sections of Arizona better than normal conditions are reported for all crops.

Apple buying in the Wenatchee Valley of Washington was held up recently by threatened tie-up of railroads. Prices are better than ever received before and many contracts are being made on orchard run basis.

The composite condition of all crops of the United States on August 1 was about 2.2 per cent below their ten year average on that date, 4.5 per cent lower than on July 1 and 0.2 per cent higher than final per acre yield last year.

The Exhibit Committee of Maricopa County, Arizona, has decided to make a display of agricultural products grown in the Salt River Valley at the International Soil Products Exposition to be held in Kansas City, September 24 to October 4.

There will be a slight decline in the amount of wool produced in Arizona this year from last year, according to preliminary estimates. The clip for 1918 was 5,628,000 pounds and for 1919 it will probably be not more than 5,000,000 pounds.

Milk dealers of Phoenix, through the Retail Milk Dealers Association have employed a bottle collector who is deputized as a special police with powers to search for empty bottles. His first report showed a collection of 5000 bottles from an area about four blocks square.

Why Agricultural Fairs in California?

IN the issue of the California Cultivator of September 16, 1916, editorial correspondence referred to the fact that "The one event of state fair week most spectacular and most commented on was the burning of the great horticultural, or central and most important, building on the ground. Filled with choicest of fruits and other products, many mineral, fine art and other collections of various counties, it chose Sunday evening at the very beginning of the fair as the time for featuring the most spectacular event of California state fairs."

Today there opens in Sacramento the state fair for 1919. The magnificent $300,000 structure, which stands on the spot only a mass of blackened ruins three years ago, is filled with horticultural, agricultural and fine art exhibits and is surrounded by other exhibits of machinery, farm implements, farm power and, greatest of all, a wonderful exhibit of pure bred live stock to an extent greater than any preceding fair. If the strike of railway and other workers, which, as these words are being written, appears to be threatening the entire United States, permits we believe this great exhibit will be visited by a greater number of real seekers for information than any preceding fair. The horticultural building referred to was nearly one-half completed at the time of the last fair. Owing to labor and war conditions delays had prevented the completion of the northern wing, but today both wings and the great dome are housing exhibits which busy farmers and fruit growers have taken a moment's time to prepare.

George Roeding, the president of the fair association, has given of his time and energies in preparation for this event as never before, and not content with taking time to plan for the present show is looking ahead and planning for a greatly improved and beautified state fair grounds which shall have permanent artistic buildings for every department. Mr. Roeding proposes to present to the state legislature at its next session a request for a quarter of a million dollars annually for four years.

The $300,000 agricultural pavilion, recently completed, and the new women's building are to be the nucleus of the building plan as proposed. Other structures would include a concrete grand stand underneath which would be additional space for various exhibits, an automobile pavilion, stables and stock barns, buildings near the entrance in which counties of the state could install permanent exhibits, an horticultural building, poultry building, and buildings along the railroad tracks where stock, farm products, and other exhibits could be loaded and unloaded. All the structures would be of attractive design and absolutely fireproof.

The buildings would be so arranged that large parks or courts would occupy the space between and around them. In these spaces there would be planted trees, shrubs and vegetables representative of every country in the world. "The climatic and soil conditions at the fair grounds are such," said Roeding, "that anything grown anywhere could be grown on these grounds. Not only would there be gardens showing the wide variety of California products cultivated in such a way as to provide valuable information and suggestions for California agriculturists, but we would have experimental gardens as well. In these experimental gardens, for instance, we would have cork trees and licorice-plants, for I am convinced that cork and licorice could be produced just as readily in California as in localities in which they are indigenous. The state fair grounds would thus be the medium for innovations and new ideas in agriculture and horticulture. It would be an exposition grounds of which every Californian would be justly proud."

The plans will be placed before the next legislature when a concerted effort will be made to secure the appropriation.

But the plans for the future are not allowed in any way to affect preparations for this year's exposition. The stage is set for the 65th state fair, and the Cultivator has deemed it worthy of giving almost its entire issue in honor of this event. A glance through the paper, however, may make it appear that this is a live stock special. This is simply because the live stock people are alive as no others connected with the agricultural industry. California is learning its need of the live stock industry. More, it is meeting the need with characteristic California vigor, and the industry is increasing today as never before in the history of the state. A live stock showing such as this issue of the Cultivator makes would have been impossible five, or even two, years ago. The richest state is that in which the live stock industry is fostered. So while this number of the Cultivator is issued as a fair special it is with a great deal of satisfaction we call attention to the wonderful increase in the state's live stock industry.

But really this is not a state fair number so much as it is simply an agricultural fair number, for there are fairs and fairs, from San Diego to —nearly at least—Shasta. San Diego County opens up her former exposition grounds at Balboa Park and will hold for the first time in years a county agricultural fair. Her neighbor on the north, Riverside, is preparing, under the name of the Southern California Fair, for an exhibit of agriculture of the Southland. Los Angeles Liberty Fair of last fall was so seriously hit by the flu epidemic, quarantine for which proved such a serious handicap, that an agricultural fair will not be held, but an agricultural live stock show is under way. It will be under the management of C. R. Thomas who managed the live stock department of the Liberty Fair. Mr. Thomas is a life long live stock man and thoroughly at home in making preparations for this great event in the live stock industry of the Pacific Coast. Another fair in Los Angeles County, while not so ambitious, will illustrate, and we know will prove, the worth of Antelope Valley as an agriculturel section. The valley will hold its agricultural fair at Lancaster. A full list of all the fairs in the state is given, with dates, on this page. But let us refer in a word to another great exposition of live stock. that known as the California International, to be held in San Francisco. Prof. Gordon H. True of the state university is managing it, and this insures a live stock show of real merit, which will be a great factor in informing Californians as to the magnitude of the live stock industry.

But why is a fair?

There is labor shortage, and every business man is busier than ever before. Every move not necessary in the regular channels of business is only an added burden. Why not in a year such as this devote every energy to producing and to marketing the product?

Because the world never becomes so busy as to stop its educational work. No matter how great the press upon us we must keep abreast of the times. "To see it once is better than to read about it a thousand times," is an old Chinese proverb. One sees it at these fairs. Even some of the farm practices are seen in actual demonstration. But especially does one see it in the perfect lines of high quality pure bred stock. One sees it in the latest improved machinery. One sees it in the different forms of farm power which show wherein a hired man may be saved and electricity and gas made to do it.

Readers of the Cultivator, go to the state fair if you can, but in any case visit your nearest agricultural fair this fall.

FAIR DATES

California State, Sacramento, August 30-September 9, Secretary Chas. W. Paine.
San Luis Obispo County, San Luis Obispo, September 9-13.
Humboldt County, Ferndale, September 16-18, Secretary W. S. Moore.
Antelope Valley, Lancaster, September 17-20, Secretary, R. B. Cameron.
Napa County, Napa, September 18-20, Secretary E. P. Locanini.
Kings County, Hanford, September 22-27, Secretary Frank C. Russell.
Glenn County, Orland, September 22-27, Secretary E. A. Kirk.
San Diego County, Balboa Park, San Diego, September 24-27, Secretary Mellinger.
Fresno District, Fresno, September 30-October 4, Secretary C. G. Eberhart.
Napa County, Napa, October 2-5, Secretary Nathan F. Coombs.
Tulare County Live Stock Show, Tulare, October 6-11, Secretary R. C. Sturgeon.
Southern California, Riverside, October 7-11, Secretary W. W. Van Pelt.
Ventura County, Ventura, September 25-27.
Monterey County, Salinas, October 10-11.
Los Angeles Live Stock Show, Los Angeles, October 18-26, Secretary C. R. Thomas.
California Industries and Land Show, San Francisco, October 14-19, Secretary E. H. Brown.
California International Live Stock, San Francisco, first week in November, Secretary Gordon H. True.

Waiting for the Thriller

The state fair grounds sometimes seems hardly able to contain the immense crowds which gather. There is almost every day a good attendance, but usually on one particular day some spectacular event, and the making of it a holiday by Sacramento and the surrounding country, fills the three great grandstands, and they overflow. The great mass of people in the foreground is simply the overflow from the central grandstand.

Walnut Outlook

CIRCULAR Number 2 of the California Walnut Growers' Association estimates the coming walnut crop at 46,000,000 pounds. This will be by far the largest California has had. Last year's output was approximately 39,000,000 pounds and the preceding year, that of 1917, 32,000,000.

The circular continues:

Practically all shippers have apparently booked orders for tho full quantities of walnuts they estimate they will obtain from growers and have been off the market for some time. Within the last 90 days the association has been offered much business it felt necessary to decline as its estimated output of Number 1 Soft Shells and Budded has been long since contracted for. Thus, notwithstanding the heavier probable tonnage, the demand seems materially greater than the supply, especially for Number 1 Soft Shells.

During the last year Southern California has experienced a severe drouth (prevalent before July 1). The average rainfall in the walnut growing sections is about 17 inches annually. For the last 18 months the average rainfall has been but nine inches. This has proven greatly inadequate.

Those growers who have not an artificial water supply find that not only the vigor of their trees is impaired but that they will have only about one-third of a normal crop, with a very heavy percentage of Number 2's. However, fortunately eighty per cent of the walnut groves in California are under irrigation systems and most of these will return excellent crops, though the additional irrigation expense resulting from the use of at least three times the normal amount of water has been tremendous.

The big crop is due primarily to two factors. First: Better, more intelligent and more thorough cultural methods on the part of growers, due largely to the efforts and advice of the association's field department. Second: The ever-increasing acreage coming into bearing—(There are now 77,000 acres of walnuts in California.)

The walnut trees were fully a month later than usual in putting on their foliage and setting the crop, but the development of the nuts is now not over ten days later than normal. Because of this short growing season the nuts did not have time to develop as large average sizes as last year, consequently the crop will show about 17 per cent Number 2's and the Number 1's will not be as large as in 1918.

Practically the entire increase in production will be of the Budded variety, which fortunately will be of the usual fine size as most of the plantings for the last ten years have been Buds, and young trees always produce the largest nuts. Those of our trade who are not featuring Budded walnuts are overlooking a good bet. The Budded is the coming California walnut. It is larger, has a smoother, thinner shell, a plumper, heavier meat and a more exquisite flavor than the Soft Shell. Some day there will be ten pounds of Buds produced to one pound of Soft Shells. The merchant that features Buds now is rising with the tide. The differential in price on Buds this year will be lower than usual.

The average merchant perhaps doesn't realize how rapidly the farmers' cost of production is advancing. The monthly Reporter of the United States bureau of crop estimates shows that the average costs of 96 staple articles which the farmer needs have advanced 97 per cent in the last five years. With the walnut grower costs have this year practically doubled, largely due to the necessity of using almost three times the normal amount of irrigation water, most of which is pumped from wells, the water level in which has lowered through constant pumping in a year of light rainfall, and on account of the unusual amount of high-priced extra labor needed to apply the irrigation. Thus at even the highest prices the walnut grower may hope to obtain, his net profits will be smaller this year than usual.

During the past year or two prices on walnuts and in fact on most other commodities to many of us seemed unusually high, and they are high when measured only by the old standard of value of the dollar. Many of us lose sight of the fact that the dollar is simply a medium of exchange and its value can only be measured in the ratio it bears to commodities. There are practically no more commodities per capita now than there were five years ago, but there are about twice as many dollars in circulation, especially when we consider the tremendous volume of purchases made with the smaller denominations of Liberty Bonds. Consequently the value of a dollar today in purchasing any commodities, including labor, is hardly half what it was in normal times. Thus when one figures a dollar as simply a medium of exchange, prices can hardly be considered higher now than they were during the pre-war period. As a concrete illustration, the farmer today can only exchange a couple of bags of walnuts for the same suit of clothes, set of harness or bill of groceries that he could exchange two bags for in 1914. He pays his labor twice as much, but his farm hand can only buy the same amount of necessities with his extra wage that he did a few years ago when earning about half as many dollars.

The New Idea in Cooperation

By H. H. Warner

THE farmers' cooperative associations in California are stronger today than ever before. More and more growers are coming to realize that it is to their advantage to market their crops through these cooperative enterprises not only because of the greater returns which they receive but because these organizations are constantly striving to improve conditions in the industries with which each is vitally concerned.

The history of these great non-profit growers' marketing associations can be traced through three distinct stages, the first two of which are fairly familiar.

Whether it is the marketing of oranges, lemons, raisins, almonds or walnuts, the first great effort in each case was to establish a force of representatives in Eastern distributing markets and to build up an efficient sales organization. All of the associations in California were born of adversity and the lessons learned in the troublesome days of cut-throat competition, excessive commissions and inadequate distribution pointed the way to the building up through modern methods of a more efficient method of distribution at a smaller cost of operation.

The second stage of development was evidenced by a desire to reduce still further the cost of operation through the cooperative purchasing of supplies in large quantities. Supply companies, usually separately incorporated, were organized for the buying of materials used in the packing of the product. This idea reached its greatest development in the Fruit Growers' Supply Company of the California Fruit Growers' Exchange, which today owns not only the timber lands but also the mills where the box shook is manufactured. Nails, fumigating materials, fuel oil for smudging, fertilizers, etc., are purchased in the open market by the trainload and very appreciable savings effected through buying in large quantities and supplying the packing plants or individual growers with the material needed at actual cost. The same service is rendered members of the California Walnut Growers' Association in the purchase of large quantities of bags, twine, bleaching material, spray material, etc., at manufacturer's prices. The Raisin Growers' Association and many other cooperative associations of growers function in this same manner. Not the least of the reasons why the cooperataive grower secures higher net returns for his product than the independent grower is the saving made possible in the purchasing of his material through this method of collective bargaining.

In their enthusiasm over these savings, some of the supply companies have branched out to a point where the grower may buy his automobile tires, house furnishings, wagons, etc., at wholesale prices. Naturally this has encountered the opposition of the town merchants, and today it is generally considered the better part of policy to confine the cooperative purchasing idea to those supplies needed in the packing of the product and to those materials used by the growers which are not carried in stock by his local merchant.

With the same purpose in mind the larger cooperative enterprises in the past few years have developed the use of by-products to a high degree. The work of the California Fruit Growers' Exchange in the manufacture of orange marmalade from the cull oranges of its members is a well known example of the intelligent use of the poorer grades of fruit unfit for packing and shipping. In the California Walnut Growers' Association the cull walnuts are cracked and the extracted meats sold to wholesale confectioners the country over. This association has even gone a step farther and sold the shells at a nice figure to a manufacturer of dynamite.

In the case of both oranges and walnuts the members of the associations not only receive more money for their low grade product than was possible before, but the cull fruit is taken out of the hands of peddlers and fruit dealers who under the old system often misrepresented it in the coast market, making destructive competition for the better grades. Now it is possible for the tourists in California to purchase from the grocer or fruit vendor oranges, walnuts and other fruit which are equal in quality to what they buy at home, a condition which did not always obtain under the old plan when the local markets in California were usually glutted with inferior fruit.

The more recent line of activity in the development of the cooperative marketing associations, unlike the first two ideas, is concerned chiefly in advancing any movement which is of benefit to the entire industry, and in so doing of course the non-member benefits to the same extent as the cooperating grower.

Many of the producing industries of the state are facing rapidly increasing outputs. Extensive national advertising must be carried on by the growers' organizations in order to increase the consumption somewhat in relation to the larger output each year or else lower returns may reasonably be expected. The raisin growers have succeeded in this way in teaching the public to eat raisins the year round instead of only during Thanksgiving and Christmas. This same principle of increasing the demand through spreading the period of consumption is now being employed in the well directed advertising of the walnut growers who are handling a larger crop every year. The extensive publicity campaign of the orange growers has long been used as an object lesson in

BANISH SCRUB SIRES FROM UNITED STATES

With confidence that better live stock will bring satisfaction and many benefits to its owners, I invite the concerted action of farmers, stockmen, and others in banishing scrub sires from the United States. The widespread use of inferior male breeding animals has been for many years a cause of low production per animal and of needlessly poor quality.

The continuance of such conditions is uneconomic and unnecessary. The direct and practical means of improvement is to use breeding animals, especially sires, which are true representatives of breeds developed for a definite, useful purpose.

I am confident, too, that the public, knowing production to be performed with maximum efficiency, will look upon stock raising with increased respect and understanding. In a few localities noteworthy improvement in special lines has been taking place through individual and community efforts. Let us now hasten such improvement wherever live stock is kept in the United States.—J. R. Mohler, Chief, Bureau of Animal Industry, U. S. D. A.

this connection. Were it not for the splendid results which have been secured through stimulating the consumption by national advertising the growers of many fruits in California would be much more worried about overproduction. Of course it goes without saying that the grower who is not affiliated wtih the great cooperative associations benefits from the advertising to practically the same extent as the one who is a member.

The California Fruit Growers' Exchange has for years cooperated with all experiments looking toward the improvement of growing conditions. The work includes the carrying on of fertilizer test plots, variety tests for the selection of blight resistant trees, soil moisture plots for the control of dieback and an experimental plant for the manufacture under the direction of a university professor of a dusting compound for the control of aphis and the codling worm. Similar work of this nature is conducted by the other large cooperative associations, the results of which are of benefit to every grower.

Still more important in some ways than the advertising campaigns and the experimental activities is the effective way in which matters relating to freight rates, tariffs and legislation is handled. When matters of this kind arise these associations go to all the expense and trouble of preparing the growers' side of the case, usually with little or no assistance from the independent shippers who are not so directly interested in the welfare of the growers. The rebate in the freight rate on lemons won a few years ago by the California Fruit Growers' Exchange and the recent $10,000 appropriation by the state legislature for fighting the walnut codling worm are but two of a large number of cases which resulted from the favorable presentation of the growers' viewpoint by the large associations.

In all of these matters the associations are working for the advancement of the entire industry and are demonstrating a very commendable broad policy. Unlike the results derived from the work done in the first two periods of growth, however, the results from this third phase of activity are of equal benefit to the non-member as well as the member. The independent grower who refuses to contribute to the organization which fights his battles and generally improves conditions in the industry profits to the same extent as the loyal member.

Tractors Help Bean Growers

By Arthur L. Dahl

VENTURA County has always been famous for its beans, and the Limas of the South find a ready market throughout the world. But all the beans grown in California do not come from the 60,000 acres devoted to them in Ventura County, for the total bean acreage of the state exceeds 558,000 acres, and on this area the annual production is from eight to nine million bushels, or approximately 45 per cent of the entire crop of the United States.

The growing of beans presents special problems which must be solved by the farmers, and in the solution of these problems the tractor manufacturers of the Pacific Coast are affording aid of the most valuable kind. California is the home of the track-laying type of tractor, for it originated here and many of the largest plants for the turning out of these machines are operated in this state. Probably no one class of producers has found the California tractor more adapted to the many demands of their fields than the bean growers. In the bean fields of the state from the northern part of the Sacramento Valley to the fields of Imperial Valley, one can see the tractors chugging away at some sort of work, from plowing to harvesting. To meet the need of bean growers special types of tractors have been designed, with special tracks to give clearance of bean rows, and other adjustments to make them available for all kinds of field work.

Bean land should be plowed deep in the fall and allowed to remain rough until the early rains have softened the soil enough to pulverize. In doing this deep plowing the tractor has been found invaluable, for the work can be done with greater uniformity, in shorter time and with less expenditure of human labor than with the use of horses. In the Sutter Basin of the Sacramento Valley, where bean growing has reached large proportions during recent years, practically all of the big growers rely almost entirely upon tractors to do their plowing. For instance P. J. Hiatt of Woodland, who owns three 20-35 tractors, plowed last season over 1000 acres of bean land, harrowed, planted and cultivated over 3000 acres of land, and performed other work with his machines. F. M. H. Wulff of Grafton, used his 20-35 tractor for all kinds of bean work, including the plowing of 480 acres, the disking of 320, the harrowing of 480, and the planting of 400 to beans. So well satisfied was he with the performance of his machine that he intends to do all his bean culture this year by power farming.

The tractor will take care of the power requirements for getting the land in proper condition for beans from the early plowing through the various stages of rolling, disking and harrowing until the soil is ready for seed.

Bean farmers using tractors have found it very desirable to use the power machines for all operations because when the seed was planted by the tractor the rows were of uniform width, and the subsequent steps of cultivating could be carried on with the tractor because the machine would pull the implements exactly in the same order as the preceding step. Where planting was done by horses, tractor cultivation was found to be impracticable due to the impossibility of keeping the rows straight and parallel in planting. The average acreage cultivated per day was also found to be slightly higher than planted, less time being lost at the ends of the rows in turning and the filling of planters being eliminated. On the bean lands of the River Farms Company near Knights Landing, a tractor is used to pull six two-row planters, and the same machine will easily handle three four-row cultivators at one time. One tractor in the Sutter Basin planted and cultivated a thousand acres of beans during a single season, and the work was done in good time.

Bean pods ripen progressively upward from the base of the plant, the entire ripening period usually extending over several weeks. This gives considerable latitude in the time of harvesting operations, but in most instances the primary object is to complete the work before the occurrence of fall rains. Generally cutting starts when the majority of the pods have turned color, yet before the oldest ones have commenced to split. Where the rains come unusually early or the beans are late in maturing, great loss is apt to occur unless the harvesting can be rushed through with the greatest possible speed. Tractors have been found to be very valuable for supplying adequate power for the various steps in harvesting beans, from the cutting of the vines to the operation of the threshing machines.

Last season the weather conditions were adverse for beans in the northern sections of California as the season was late. Due to war demands an unusually large acreage was planted to beans, and in the harvesting of the crops the farmers who used tractors found themselves possessing an advantage over their neighbors who used horses. In many cases the horses could not finish the cutting in time to prevent loss from wet weather, while the tractor operators, through their ability to cut the vines faster and more steadily, were able to harvest their crops without loss. A tractor will cut from six to eight rows at a time, and the machine can keep up this work steadily from dawn to dark, whereas horses soon tire from the heavy strain. The average area cut in a day with a tractor last season was from 40 to 50 acres, and one owner cut more than 1700 acres for himself and his neighbors.

The tractor motor furnishes ample power for operating a bean thresher, and many owners of machines used them for this class of contract work

Another way in which bean farmers utilize their tractor power is to haul the threshed beans to the warehouse. By loading three or four wagons or trailers with the sacked beans, it is possible to make but one trip instead of several, with horses, and considerable time can thus be saved in getting the crop to market.

In the growing of beans there are long periods during the year when very little work can be done in the fields, and yet if the owner is to rely on horse power during the times when the work is heavy, he must feed and care for this stock during their periods of inactivity. With feed scarce and expensive, the maintenance of a dozen or more head of stock on the farm is a problem, unless adequate pasture is available for the horses.

Where a large number of horses or mules are kept on a farm it is often necessary to hire additional help to look after them, thus adding to the expense and increasing the housework of the wife. With power machines a great deal of this extra work and expense can be saved, for when the tractor is not in use it can be run into the barn and left without attention until needed again. After the mechanical features of a tractor have become familiar to one, almost anybody can operate it, and during the labor shortage resulting from the war many tractor owners found that their young sons and daughters could take their turn in keeping the tractor going in the field, after the machine had been started and adjusted by the father.

The tractor is coming into almost general use for bean culture because of its dependability during the peak times of field work. If weather conditions are adverse, the tractor will get the work done in the shortest possible time, often with the result of saving the crop from damage. During the heavy work of harvesting the beans it is often unusually warm, so that horses cannot give their full strength or endurance to their work. The insensible tractor will give of its sustained power hour after hour, unaffected by atmospheric conditions and the ease with which the power machine can be directed and turned will enable the operator to conserve his own strength and work for longer hours when the occasion demands.

This Year's Pear Crop

THE commercial pear crop of the United States, as estimated by the bureau of crop estimates, shows a five point increase over last month, and tho commercial crop in the important states is now estimated at 3,351,000 bushels as compared with 7,589,000 bushels last year, or 110 per cent of last year.

The feature of the report is the very large crop in California and the West generally. California has the largest commercial pear crop in its history, and the production is estimated at considerably over 4,000,000 bushels.

Conditions throughout the East have shown some improvement over last month, particularly in New York and Delaware. The Hudson Valley pear crop now promises to equal that of 1918. Michigan and Illinois have also increased over the July estimate.

California

California, which produces almost three times as many commercial pears as any state in the Union, now has prospects for 95 per cent of a crop, or 112 per cent of last year. Attention is called to the fact that usually only about half of the pear production of California was shipped fresh, approximately 30 per cent going to the cannery and 20 per cent to the drier. The estimate for California this year indicates that about 50 per cent will be shipped fresh, 40 per cent canned and ten per cent dried, although the disposition of this year's crop will depend on the relative price for pears for canning, drying and shipping. Solano County will ship about 75 per cent of its crop fresh, while Santa Clara County promises to can nearly 70 per cent of its crop. The Sacramento Valley will probably ship as fresh fruit over half its crop this year. The shipments of fresh pears from California to August 4 were 2200 cars as compared with 1500 up until the same date last year.

Washington

The Yakima Valley, which is the principal pear producing region in the Pacific Northwest now promises to ship about 2400 cars, or 25 per cent more than last year Of this crop over 80 per cent will be Bartletts and about 12 per cent Winter Nelis. The best crop in the Yakima Valley is found on the higher elevations. The Wenatchee Valley has prospects for about 600 cars which promise to be of fine quality. The Washington crop will move almost entirely in bushel boxes, 511 to the car and 51 pounds per box.

Oregon

The Rogue River Valley, centering about Medford, Oregon, which is the leading pear region in the state, now promises to ship about 650 cars in addition to 100 cars which have been sold to local canners. Bartletts are reported as being a very good crop, Howells are a fair crop, Bosc is a small crop, but of good size and quality; Anjous are a very good crop and quality good, Winter Nelis small crop and small in size. The 1918 crop for Rogue River Valley amounted to about 550 cars. Not many commercial pears are shipped from other points in Oregon except the Hood River Valley which will probably ship about 150 cars.

Colorado

The commercial pear district of Colorado is located in the Grand Valley, particularly about Clifton, Grand Junction and Palisade. The crop is now estimated at 387,000 bushels compared with 182,000 bushels last year, or 213 per cent of the 1918 crop. The crop will be the largest in the history of the Valley, several orchards coming into full bearing this year. A production of from 700 to 800 cars is now estimated for the entire Grand Valley estimates increasing materially over those of July 1. The quality is reported as excellent, fruit is large and clean, Flemish Beauty has the lightest crop of any variety.

Utah

Utah is not classed as a commercial pear state. However, from 35 to 40 cars will be shipped out of the Provo district in Utah County this year.

Eastern States

New York, the leading commercial pear state in the East, now has a condition of 35 per cent, or 630,000 bushels as compared with 828,000 bushels last year and 1,250,000 bushels in 1917.

The pear crop this month for New Jersey promises to be the same as last month, or 35 per cent as compared with a condition of 37 per cent last year. The Kieffer, which makes up fully 80 per cent of the New Jersey crop, shows a condition of 32 per cent, while Bartlett, making up about 15 per cent of the crop, shows a condition of 42 per cent. LeConte shows a like condition, while Duchess, which makes up less than two per cent of the crop, shows a condition of 40 per cent. Seckel indicates about one-third of a crop.

The commercial pear crop for Delaware this year is indicated at 30 per cent, or 240,000 bushels as compared with 296,000 bushels last year and a full crop of 800,000 bushels or 1,500,000 baskets. The pear crop for Delaware is usually shipped in five-eighths bushel baskets. Expressed in terms of car loads, allowing 500 bushels to a car, Delaware this year will ship 480 cars as compared with 592 cars last year and 1800 cars in a full crop year.

No change in the commercial pear crop for Texas is noted. It is now estimated at 75 per cent of a crop as compared with 60 per cent last year. The most important section in the state, around Clint and Ysleta, near El Paso, will probably ship 100 cars this year. The total carlot movement of pears for the state will probably not exceed 120 cars.

The commercial pear crop for Michigan is very light this year, being estimated at 15 per cent of a crop. Berrien County, with its production centering around St. Joseph and Benton Harbor and which normally produces 58 per cent of the total commercial pear crop of the state, will have less than six per cent of a full crop as compared with 45 per cent of a crop last year.

The commercial pear crop for Illinois is now estimated at 47 per cent as compared with 33 per cent of a full crop last year. The heaviest pear producing county in Illinois is Marion, with its production centering around Alma and Salem in the central and northern part of the county. The shipments from Marion County this year will approximate 125 cars, or better than 35 per cent of a full crop as compared with 20 per cent last year.

Pike and Daviess are the leading commercial pear producing counties in Missouri. A few cars are produced near Cedar Gap in Wright County. Probably not to exceed 40 cars will be shipped from the entire state this year. Kieffers are the principal variety grown.

THE WESTERN APPLE CROP

Washington

Conditions in Washington have generally improved during the month, particularly in the Yakima Valley and the Spokane district. This year Washington will be the leading apple producing state by a large margin and promises to ship approximately 21,300 cars as compared with about 17,000 cars in 1918. The Wenatchee North Central Washington district now promises to ship about 9600 cars. Conditions are excellent; fruit is very large and of superior quality. Of the 9600 cars promised from this district there will be approximately 2800 cars of Winesaps, 1800 cars Jonathans, 1300 cars Delicious, 900 cars Spitz, 800 cars Rome Beauties, 200 cars Winter Banana and smaller lots of a number of varieties. The Yakima Valley district now promises 9500 cars, an increase of 1500 cars over last month's estimate and 2000 cars more than last year. The increase is due to excellent growing conditions and the large size of the fruit, which is the largest in the history of the valley for this time of year. Jonathans will make up the heaviest production and and are 85 per cent of a crop, followed by Winesaps which are lighter or 55 per cent of a crop. Rome Beauty is about 95 per cent of a crop while Spitz and Newtowns are fully 85 per cent. The Spokane district, due to recent heavy rains, is now estimated at 700 cars as compared with about 1000 cars last year. A large part of this production will be Wagener and Jonathan. Walla Walla, which last year shipped only about 130 cars, now promises fully 1000 cars, of which about 450 cars will be Rome Beauty 250 cars Jonathan, 200 cars Winesap and 50 cars Yellow Newtowns; the remainder will be mixed. The White Salmon and Underwood section now promises to ship about 260 cars. The apples from the state this year promise to be of exceptional quality and size and will be loaded about 756 boxes to a car.

Oregon

Oregon now promises to ship about 5028 cars as compared with 2663 cars

1600 3½ inch Tires per Day

That is the production capacity of Firestone Plant No. 2, devoted solely to this size—the size used by more than half the car owners of America

The true value of the Firestone No. 2 Factory lies in the kind of 3½-in. tires it turns out.

All the floor acreage, the batteries of special tire machines, the carefully chosen and organized workers express themselves in one thing:

A better 3½-inch tire.

The reception given the new Firestone 3½-inch tire proves that Firestone could and did unite resources and volume to produce a quality previously unattainable.

The above are the boiled-down facts of a tire made in quantity so that every one of its mile-giving qualities can be offered at the prices mentioned.

Firestone 3½-inch Special Molded Tire
At These Prices

	Non-Skid	Gray Tube
30x3½	$18.00	$3.25
32x3½	$21.00	$3.70

6,000 Miles

Look at the cross section of this tire at your Firestone dealer's.

From bead to tread, you find sound, enduring construction.

You can see the extra rubber between fabric layers.

You can feel the resilience in the tread. And you sense toughness there, too, in the spring and vigor of the live rubber.

Cushion, breaker-strip and sidewall are generous in size and in the quality of rubber.

Equip your car with these new 3½-in. tires, the latest example of most miles per dollar.

This is the **Firestone** *Year*

in 1918. Conditions in the Hood River Valley are excellent. The apples are of good size and quality and the estimated output for the valley is now 1,800,000 boxes as compared with about 1,350,000 in 1918. The bulk of this production is made up of Spitz and Newtowns. The Rogue River Valley or Medford district is estimated at about 700 cars, while the remaining counties in western Oregon will ship about 500 cars. The Mosier and Dufur sections in Wasco County are estimated at about 350 cars, while the Milton Freewater district promises about 500 cars, or twice as many as last year.

California

The Watsonville district, located in Santa Cruz and Monterey Counties, now promises to pack about 3,000,000 boxes as compared with 2,500,000 boxes in 1918. Present conditions are very favorable. Belleflowers will show fully a 25 per cent increase over last year, while Newtowns will run slightly better than last year. Growers report prices for fancy Newtowns at $1.85 to $2.00 per box. The Sonoma County apple crop is estimated at between 600 and 700 cars, of which nearly 400 are Gravensteins. The Yucaipa section in Southern California is fast increasing in importance and has a very good crop of splendid quality this year. The Watsonville dried apple output is now estimated at 4500 tons, while the Sebastopol section is estimated at 3500 tons.

Idaho

Idaho now promises to ship fully 4000 cars or 500 cars more than the 1917 crop. The Payette-Weiser district is estimated at 2500 cars, 700 of which will be shipped from Fruitland. The Boise Valley will ship 500 cars, Twin Falls 500 cars, and the Lewiston district 400 cars. The crop this year will be eight to nine times that of 1918 and thus far is of excellent size and quality.

Colorado

Colorado now promises about 2,523,000 boxes as compared with 1,581,000 boxes in 1918, or an increase of 60 per cent. The Grand Valley will probably ship about 1800 cars while Delta County promises about 900. Jonathan, Winesap and Rome Beauty are about 50 per cent of a crop and will make up about 400 cars, while Ben Davis and Gano are a full crop and will make up a like number of cars. Fremont County or the Canyon City district promises about 600 cars. Fruit in the latter district has been severely injured by leaf roller. Montrose County is almost a complete failure due to the heavy late spring frosts. Apples in Mesa and Delta Counties are of good size and quality. Weather is favorable for fine color and maturity. The crop thus far is generally free from worms.

Utah

Utah indicates a fairly light crop, or about 83 per cent of last year. Utah County will have about 250 cars, Davis County 125 cars, while Weber, Box Elder and Cache Counties will each ship less than 50 cars. Jonathan, one of the leading varieties, is generally reported very light.

New Mexico

The Pecos Valley in New Mexico is now estimated at about 500 cars. Ben Davis will make up the heaviest shipments. In addition there promises to be 50 cars of Jonathans, 20 of King David, 20 of York, ten of Winter Banana, and several cars of Winesap, Arkansas Black and Gano. The quality is good particularly in regard to size and color although there is considerable hail damage. San Juan district in northwestern New Mexico promises about 100 cars.

Montana

Montana is now estimated at 450 cars, most of which will originate in the Bitter Root Valley. The leading variety is McIntosh.

The man who is worthy of being a leader of men will never complain of the stupidity of his helpers, of the ingratitude of mankind, or of the inappreciation of the public. These things are all a part of the great game of life, and to meet them and not go down before them in discouragement and defeat is the final proof of power.—Elbert Hubbard.

NURSERY STOCK IMPORTATIONS PERMITTED

Importations of nursery stock and other plants and seeds from contiguous countries, the entry of which will not be attended by serious risk to the agriculture, horticulture, and floriculture of the United States, are permitted by an amendment to the plant quarantine act, according to an announcement just made by the United States department of agriculture. The amendment became effective August 16. Under it the secretary of agriculture may issue permits for importations of nursery stock, plants and seeds which can be considered as peculiar to such contiguous countries and are not mere reproductions of imported stock from foreign countries, and which are not available in sufficient quantities in the United States. It does not apply to plants and seeds governed by special quarantines and other restrictive orders other than Quarantine No. 37, which is now in force. In addition to the certificate as to freedom of pests required in connection with all plant importations the invoice covering the material offered for entry under this regulation must be accompanied by a certificate of a duly authorized official of the country of origin, stating that the material has been produced or grown in the country from which it is proposed to be exported.

FREE
$3000 BOOK
OF
BARN PLANS

Going to build or remodel a barn? Then send for this book. 112 pages of the most practical barn plans ever published. Treats every phase of modern barn construction. Cost over $3,000 to compile. Yours free—for the asking.

AND WE WILL ALSO SEND YOU THE COMPLETE LOUDEN CATALOG of modern sanitary barn equipment. Send for these two valuable books today.

LOUDEN
BALANCE GRAPPLE
HAY FORK

Lifts an enormous load. Binds it tight. Drops it clean. Spreads it well in the mow. Leaves no litterings to be cleaned up with a pitchfork. Three or four fork-fulls clear the rack. PERFECTLY BALANCED, slender but strong, will not bend or break. A money-saver in haying time.

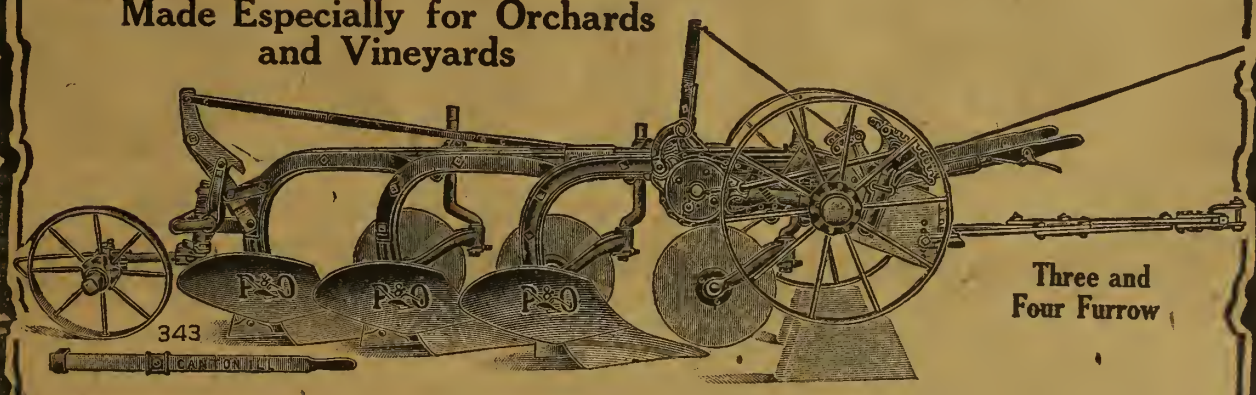
P&O Little Genius Tractor Plow

Made Especially for Orchards and Vineyards



Three and Four Furrow

One International Tractor
One P&O Plow
One Operator
} A One-Man Outfit

THE P&O No. 4 Little Genius power lift tractor plow is built especially for use in orchards and vineyards. The features which adapt it to this work are short, low-lying levers, extremely narrow wheel tread, strong heavy beams, and 10-inch bottoms of perfect design. Both wheels can be raised for opening the first furrow to a depth of 8 inches. The low levers permit work under overhanging vines and branches, and the narrow wheel tread allows the plow to work close to the trees without injuring them. Wheels have wide tires to prevent them from sinking into loose soil.

Has the power lift feature that is used on all types of P&O Little Genius plows, and possesses all the features of strength, simplicity of construction and ease of operation that have made P&O plows just a little better.

The International Harvester Company now owns the plow factory formerly operated by the Parlin & Orendorff Company. **Titan** and **International Tractors** and **P&O Plows** can now be purchased from the International dealer. Ask your dealer for a P&O catalogue.

Peach Crop Report

The condition of the commercial peach crop in the United States, as estimated by the bureau of crop estimates, has shown a decline over July estimates of about 300,000 bushels. This decrease has been throughout the east and north, New York, Michigan, Maryland, New Jersey, West Virginia and Delaware, all declining a few points over July estimates. On the other hand the Georgia peach crop has held up to earlier estimates, while the Texas and Arkansas crops, due to excellent growing conditions, have shown an increase, the Texas crop over-running earlier estimates by more than 300 cars. The Elberta crop in Colorado and the Northwest promises to be heavy and the movement will be particularly heavy the last ten days in August.

The United States crop is now estimated at 29,784,000 bushels as compared with 20,597,000 bushels last year, or a 45 per cent increase over the crop of 1918.

Western States

The quality of the peach crop generally throughout the West is excellent and the crop promises to be the largest and best in the history of the Western States.

California

The very large crop in California is the feature of the peach situation for the entire country. Fresno, Kings and Tulare Counties, in which about 40 per cent of the peach crop of California is produced, have bumper crops. Some damage is reported in the San Joaquin Valley from a shortage of irrigation water, but the state crop will run fully 100 per cent. Sutter County will probably have 25 per cent more cling peaches than last year. The state as a whole is now estimated at approximately 16,000,000 bushels as compared with 11,663,000 bushels in 1918. Although the season is about ten days late as compared with last year, the shipments to date are 1000 cars heavier than last year. Ordinarily about ten per cent of the California crop is shipped fresh and the remainder is canned or dried. Fresh peach shipments may exceed 4000 cars. The crest of the California peach movement is now on. California has prospects for the largest peach crop in the history of the state.

Colorado

The Palisade district in Mesa County promises to bear out earlier estimates of fully 1000 cars. The crop consists principally of Elbertas and will move in bushel baskets and twenty pound boxes. The crest of the movement is expected between August 20 and 25. Quality and size are excellent. Delta County suffered from frost and will ship about 350 cars.

Washington

Various estimates are received from the Yakima Valley, which is the principal peach producing region in the state of Washington. It seems probable that the entire valley may ship 2300 cars as compared with about 600 cars in 1918. The bulk of the movement will be the last ten days in August. The size and quality of the fruit is reported very good. The Asotin section has a 100 per cent crop, but the quantity is small.

Utah

Peach conditions throughout the state are generally reported as favorable, although some injury has resulted from drouth. The Brigham City district in Boxelder County will ship about 350 cars, while the Utah or Provo district is now estimated at about 450 cars, consisting principally of Elbertas. The state as a whole will ship from 1200 to 1300 cars outside of the state as compared with 1000 cars in 1918. The heavy Elberta movement promises to be the first ten days of September.

Idaho

The Council district of Idaho is estimated at 40 cars and the Emmet district at about 125 cars. Scattered plantings are found elsewhere in the state, but the crop is unimportant commercially.

New Mexico

The Pecos Valley of New Mexico now promises about 150 cars, 100 of which will be shipped locally or sold to canners. The crop is principally Elbertas. The San Juan district is a complete failure.

Our Deciduous Fruit Crop

"A bumper crop of deciduous fruits is now assured in California," is the statement of Field Agent E. E. Kaufman, bureau of crop estimates in the report issued showing condition of fruit crops on August 1.

A prolonged period of high temperatures during the past month was somewhat aggravated by a shortage of irrigation water in a few localities but barring unfavorable weather during harvest and drying time the crop can generally be considered safe. The citrus outlook is not so promising.

Peaches

Shortage of irrigation water in the San Joaquin Valley was productive of a drop of two points in the condition of the peach crop during the past month—98 on August 1 in comparison with 100 one month ago—indicating a total production of about 435,000 tons compared with 290,000 tons last year.

Prunes

In the Sacramento Valley unirrigated prune orchards suffered a heavy "drop" during July with a consequent decrease in condition. Santa Clara Valley on the other hand has prospects of the largest crop ever produced. For the state as a whole prunes are a 100 per cent crop and a minimum production of 120,000 tons is now indicated compared to about 45,000 tons last year and 109,000 tons in 1917.

Apricots

Late varieties of apricots made a better crop than expected particularly in the Santa Clara Valley and the condition on August 1 was 90 per cent of a normal compared to 88 on July 1 and 80 August 1, 1918. Conditions now indicate a total production of 165,000 tons on a green basis.

Pears

A slight improvement is noted in the condition of pears and the forecast of 110,000 tons made as of July 1 may be increased a few thousand tons for the final estimate. Shipments outside the state to August 5 were 2382 cars compared to 167 cars to same date last year.

Apples

No change in the condition of the apple crop for the state during the past month. Indicated production is for a total crop of 7,591,000 bushels or 36 per cent greater than last year.

Olives

The olive crop is very spotted, conditions varying from 30 per cent of a normal in Tulare County to 85 in San Bernardino. Butte which normally produces about 14 per cent of the state's crop reports a condition of 55. In San Diego the condition is 50; Riverside 50 and Los Angeles 70. For the entire state 65 per cent of a normal crop is indicated.

Walnuts

The condition of the walnut crop is now reported 108 per cent of a normal indicating 25,000 tons of walnuts this year compared to 20,115 tons in 1918

Almonds

Some improvement is noted in the almond crop since July 1 which with the new bearing acreage will bring the total production to at least 30 per cent more than last year when the crop was estimated at 5100 tons

Grapes

The wine grape crop is still 100 per cent of normal. In the opinion of crop reporters the prolonged period of high temperatures during July caused slight damage to raisin and table grapes Production however will not be materially affected from the present outlook and a 200,000 ton raisin crop is still probable.

FALL BLIGHT OF TOMATOES

There is practically no salvation for a tomato plant once it is stricken with summer blight As soon as it begins to show the wilt it is already choked to death by the condition of the roots. As we have repeatedly said, practically the only step to take is to destroy by burning so as to prevent as far as possible any spread of the disease. However, fall blight is another proposition. It is a fungus and its entrance into the tissues of the plant may be prevented by spraying with Bordeaux soap mixture.

A small knapsack compressed air sprayer is used in this work. Such sprayers are light, easy to operate, and produce a fine misty spray. Several different kinds, varying somewhat in shape and construction, but built on the compressed air principle, are now offered for sale.

The spray formula used is 5-5-3-50 Bordeaux soap mixture, composed of five pounds copper sulphate, five pounds stone lime, three pounds resin fish oil soap, and 50 gallons of water.

To reduce the work of preparing spray mixtures the folowing stock solutions were made: Five pounds of copper sulphate (bluestone) was dissolved by suspending it in a wooden vessel containing five gallons of water. Copper sulphate corrodes iron and tin. Five pounds of stone lime (quick lime) was slaked in another vessel by slowly adding water at first and later increasing the volume to five gallons. Three pounds of resin fish oil soap was diluted in a third vessel by stirring it in hot water until thin and increasing the volume to five gallons by adding water of ordinary temperature.

These stock solutions keep indefinitely if not mixed or weakened by rain, but the lime should be covered to prevent drying out and air-slaking. The level of the liquid when freshly made and after each spray period should be marked on each vessel, and water added when needed to restore loss by evaporation.

Ten gallons of spray mixture are prepared by taking one gallon of each freshly stirred stock solution and increasing it to three and one third gallons by adding water and by pouring together and stirring the three diluted solutions thus made. The resulting mixture is ready for use as soon as strained and should be used while fresh, as it deteriorates by standing.

COMB HONEY

Farmers' Bulletin 1039 is one of the more recent publications of the department of agriculture. It touches upon commercial comb honey production. It may be had by writing to the department of agriculture, Washington, D. C.

Comb honey production for the general market should be attempted only in locations furnishing a rapid flow of white honey.

Hives, sections, and supers should be accurately made and the parts should be interchangeable. All apparatus should be prepared well in advance of its use.

To produce a large number of workers for the spring flow, each colony during the late summer and autumn should have a good queen, an abundance of food, and sufficient room both for the stored food and for brood rearing, that the bees constituting the winter colony may be reared. Ample protection against cold and wind, with enough winter stores of good quality to last until spring, is necessary. In spring an abundance of stores, room, and protection is necessary for heavy brood rearing, to replace winter losses and produce the excess in population necessary for best results during the honey flow.

Great skill is required during the honey flow to prevent a division of the working force of the colonies by swarming and also to prevent a subordination of the storing instinct because of the crowded population of the colonies.

Preventive and remedial measures for swarming permit the beekeeper to operate a series of apiaries in different locations without the necessity of an attendant in each during the swarming season.

The proper expansion and arrangement of room in the supers is an important factor in maintaining a dominance of the storing instinct.

After the honey is removed from the hive it should be prepared carefully for market by proper cleaning of the sections and especially by grading and packing in strict conformity with established grading rules.

THE USEFUL TOAD

The amount of food a toad may consume is remarkable. The writer has taken from a single stomach the remains of 77 myriapods, or thousand-legged worms; in another, 37 tent caterpillars were found; a third contained 65 gypsy moth caterpillars; a fourth, 55 army worms. F. H. Mosher once fed 30 full grown celery caterpillars to a toad in less than three hours, while Dr. C. F. Hodge has seen a toad eat 86 house flies at one sitting. Miss Ellen M. Foskett records feeding 90 rose bugs to another toad without satisfying its appetite.

Careful figures made by the writer some years ago showed that in three months' time a single toad might consume the enormous total of 10,080 insects.—A. H. Kirkland in Boys' Life.

SAVING DAYLIGHT

When Joshua of Bible fame
Old Israel's foes did slay
He stopped the sun on Gideon
Through a long summer day.
In vain the Amorites did plead,
"I'm saving time," he said.
But had those heathen lived today
They'd set their clocks ahead.

So saving daylight is a scheme
As ancient as the race.
Old Time has oft a laggard grown—
Let's hustle up his pace;
Let's pass a law to make night day;
Let's all quit work at noon.
Supper comes now at 3 p. m.
And breakfast follows soon.

The farmer and the soaring lark
Are now quite out of date;
The firefly lights the busy bee,
The ant's an hour late.
I used to toil from early dawn
'Till sunset skies were red—
Now when I rise I meet myself
Just coming into bed.
—S. H. French, Exchange.

The Ventura County Fair has set forward dates one week. It will now open on the 25th of September, closing on the 27th. The change was made in order to merge the County Fair with the welcome home celebration for returned soldiers.

Tractor Demonstration

The Traction Engine and Implement Dealers' Association of Southern California will endeavor to make this the most interesting from an educational standpoint of any tractor demonstration ever held in the past.

The demonstration this year will be held on the Rancho La Brea on the corner of Melrose and Crescent Avenues, from September 16 to 21 inclusive, at which time all the tractor and implement men will endeavor to show the rancher every kind of work that a tractor can be put to. The tractor industry today is one of the greatest industries in the world, and the man who is planning on going back to the soil as a business will profit greatly by attending this practical working demonstration, as he can get at this time all data he needs about the tractors and implements. Ranchers that already own tractors are always ready to spend from three to five days at these demonstrations, as they are very beneficial in improving their knowledge on power farming machinery.

The Killefer Manufacturing Company will show its Standard subsoiler, tractor chisels, orchard and field cultivators, automatic disc, and for the first time at any demonstration their automatic subsoiler.

The Samson Sales Company will have on exhibit the Samson Sieve Grip Model S25, their new model 30X. This will be the first appearance on the demonstration field. This model is equipped with Remy System of Ignition and Lights, Willard storage battery and electrically controlled governor.

C. L. Best Gas Traction Company will show for the first time its new 60 horse power Tracklayer, also its small 25 horse power.

The Holt Manufacturing Company will have its usual exhibit of the 40-75 horse power, 22-45 horse power, with full line of plows and land levelers.

The Avery Company will show the following: 40-80 horse power, 18-36 horse power, 14-28 horse power, 8-16 six cylinder new model, six cylinder new model 5-10 horse power, new model cultivator and the Avery separator.

The visitors at this demonstration can witness working operations of hay baling, feed cutting, silo fillers, pumps, bean threshers, separators, harvesting machines and in fact every working condition of a tractor. There will also be an excellent exhibit of accessories such as spark plugs, magnetos, piston rings, carburetors, lubricating oils and trucks, and a great many other useful articles that are absolutely necessary to keep all farming machinery in operation.

The demonstration field can be reached by the Pacific Electric Railway on either the Gardner Junction or Sherman car line. There will be something to interest you from 8 A. M. to 5 P. M. at this demonstration, and one need not leave the field to get lunch as there will be an excellent restaurant on the field at city prices.

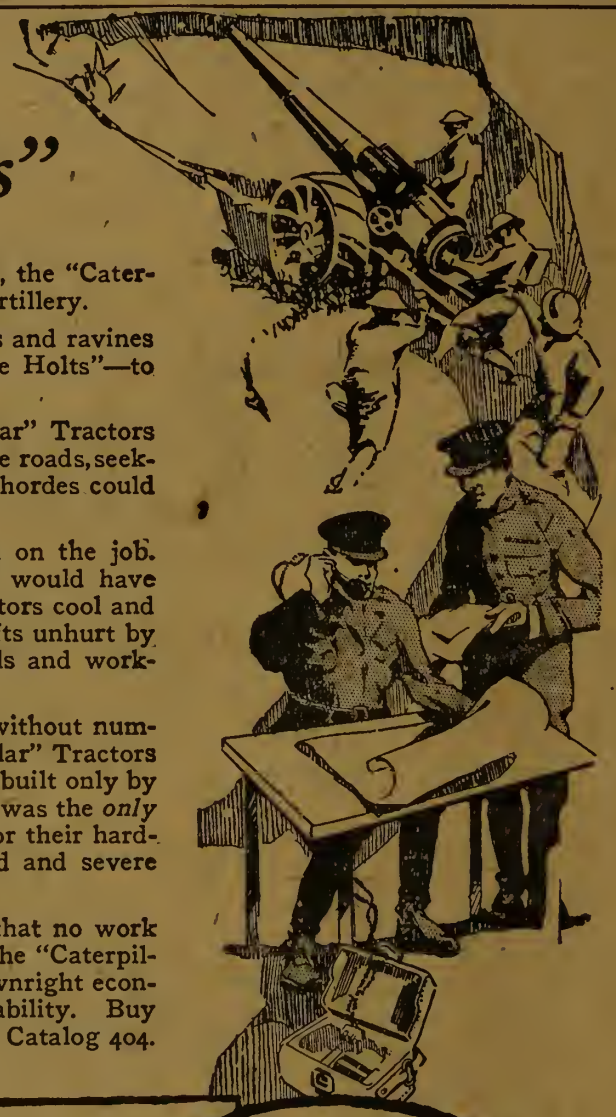
"Send Up the Holts"



In the retreat from the Somme in 1918, the "Caterpillar" Tractors saved the British heavy artillery.

All along the line in the shelter of trees and ravines they were waiting the word "Send up the Holts"—to save the big guns that meant so much.

For 24 hours at a stretch the "Caterpillar" Tractors pulled 18-ton guns along almost impossible roads, seeking the new positions where the German hordes could be held.

And the "Caterpillar" Tractors stayed on the job. At a time when a breakdown or delay would have spelled disaster they kept going, with motors cool and efficient—with track-parts, gears and shafts unhurt by the terrific strain. Holt design, materials and workmanship had proved sound.

This performance was repeated times without number during the War. What the "Caterpillar" Tractors did is history. The "Caterpillar" Tractor built only by Holt, or under Holt contracts and patents, was the *only* tractor of track-type used by the Allies for their hardest war service—chosen after prolonged and severe tests.

This War record proves conclusively that no work on farm, road or forest is too severe for the "Caterpillar" Tractor to handle with ease, with downright economy of operation, and absolute dependability. Buy your "Caterpillar" Tractor now. Send for Catalog 404.

CAN OLIVES WITHOUT BRINE

Tests by the division of viticulture of the University of California extending over a year have shown that ripe pickled olives may be canned or bottled without brine.

As soon as the pickling process is finished the olives are placed in a three per cent brine for several days until they are well salted. They are then heated to about 180 degrees Fahrenheit in this brine and placed in cans or bottles without any liquid. The cans or bottles are then sealed and heated to 212 degrees for half an hour.

Olives treated in this way have kept perfectly for a year and were equal in every way to similar olives canned in liquid in the usual way. There was no shrinking, wrinkling, softening, nor change of color.

The absence of brine makes the handling of the olives by the consumer much pleasanter and more convenient. In shipping there would also be a considerable saving in freight. The saving in weight with cans (not counting packing cases) was found to be 31.5 per cent and with bottles 16.6 per cent.

MERCURY

Mercury is an unusual metal. It is not a solid, but a liquid, a liquid so heavy that iron will float upon it. If a gold ring or coin is dropped into mercury, the gold will become covered with a silvery coating. This coating is an amalgam, which is the name given to all similar alloys of mercury. The same thing would happen if copper or almost any other metal were placed in mercury.—Boys' Life

Tractor Plowing Has Its Problems

Plowing with tractors presents some problems that never bother the man who uses horse-drawn implements. It is necessary to lay out fields, so that a high-class job of plowing can be done over the entire area with the minimum use of a horse-drawn plow in starting and finishing the work, says Farmers' Bulletin 1045, recently published by the United States Department of Agriculture, which gives in detail some of the best methods for laying out land and plowing with tractors. The methods in general use are divided into two classes in the bulletin—those in which the plows are elevated and no plowing is done across the ends, and those in which the plows are left in the ground continuously. In most cases better plowing can be done when the plows are idle across the ends of the field, and for this reason the methods of this class are more popular, but many farmers prefer the other methods, as they eliminate waste of time and labor.

Plowmen using tractors wish to reduce to a minimum the time spent in running and in turning with plows out of the ground. While it is necessary to do some traveling while the plows are idle, care should be taken not to do too much of it, as it reduces the number of acres which can be plowed in a day, making the tractor that much less efficient. Short turns, however, are awkward for most tractors, and where such turns are necessary the operator often has more or less difficulty in getting the outfit in the correct position for starting into the new furrow at the right point. Some tractors turn more easily in one direction than others. and this should be taken into consideration in laying out the fields.

Advantages Summarized

The advantages of plowing by the methods in which the plows are idle across the ends of the field are that the short, awkward turns are eliminated, except in some cases at the beginnings and ends of the lands, and usually less space will be left at the corners to be plowed with horses. The advantages of the other methods are that little or no time is lost in traveling with the plows out of the ground, and that ordinarily the number of dead furrows and back furrows will be considerably less.

In using the first-named methods it is necessary to measure the lands in the center of the field accurately, leaving an equal area on all sides of the field in which to turn the outfit, and which can be plowed last by running the tractor completely around the field several times. If one end of the field is unfenced the outfit can be pulled out into a road or lane, or an adjoining field, for turning. It may be preferable to plow up to the fence on the two sides as the body of the field is being plowed, and leave the headland only across the end of the field which is fenced. The width of the headland will depend largely on the turning radius of the tractor. With easily handled outfits it is not necessary to leave more than 15 or 20 feet, but plenty of room should always be left, and for this reason headlands 50 feet or more in width are preferable to narrower ones.

Careful Plowing Saves Time

If the field is to be finished up in the best manner, with no irregular, unplowed strips between the land or at the edges, it is essential that care be taken to have the headland of the same width clear around the field, to have the distances measured exactly when starting new lands, and to have the first furrows as nearly straight as possible. A little extra time taken in measuring off the necessary distances and setting plenty of stakes for guidance will nearly always be more than returned in saving time at the finish. If the tractor pulls three or more plows, cutting a total width of three or more feet, some effort should be made to have the width of the headlands an exact multiple of the total width of the plow, so that the last strip across the field will exactly cut out the land or finish it to the fence. This will do away with the necessity of making a trip across the field, probably over the plowed ground to turn a narrow strip which has been left unplowed.

When methods are used in which the plow is left in the ground continuously the outfit is started in the center of the field. For the first three or four rounds the plows are lifted at the ends of the furrows, and then they are left in the ground when the turns are made. The outfit is then run around the field until the entire area has been plowed, and if the field has been measured correctly before the tractor started, the last round will plow the land next to the fence on all sides.

THE SPARE INNER TUBE
By M. E. Bemis

One of the annoying things for the automobile owner is to find that when he needs it most the spare inner tube has become chafed and must be patched before it can be used or is perhaps hopelessly ruined. Like most things, there is a right way and a wrong way to pack away an inner tube, and a little care together with a knowledge of the right way may save the price of a tube and the incident annoyance of finding a perfectly good tube spoiled.

First remove the "valve inside," then holding the tube so that the valve stem points downward, roll the tube so that the air is forced out; put back the "valve inside" while the tube is still tightly rolled up; hold the tube on the two hands like a skein of yarn, with the valve stem on the outside of the doubled tube and pointing up; fold the two ends towards the valve stem. This makes the folded tube four ply. Now bring the two ends of the folded tube together with the valve stem folded between the four ply folds. A rubber band or string makes the tube ready to be wrapped in cloth or in a tube bag and will make it much safer to carry than when folded with air in it.

Get Bigger Money Harvests Easier

You farmers can save *all* the grain you raise—with an E-B Osborne Grain Binder.

Cutter bar can be set close to the ground. Reel can be adjusted to push down grain onto platform. Platform canvas runs one-seventh faster than elevator, straightening grain before elevating. Seventh roller avoids grain dropping through onto main wheel and helps prevent clogging. Drop leaves, grain springs and three discharge arms prevent stringing grain. Get all the interesting harvesting facts about the

E-B Osborne Grain Binder

from your dealer at once—or write us.

The uniting of E-B with Osborne means much to you in harvesting your crops. The Emerson-Brantingham Implement Company represents an organization of 4,000 men and 7 factories, and 67 years' experience in building fine farm machinery. Combined with this is the Osborne reputation for making harvesting machinery of all kinds.

Cletrac
TANK-TYPE TRACTOR
(Formerly known as the Cleveland Tractor)

Plows on the heels of the Harvest

The actual experience of farmers everywhere proves conclusively that wheat yields are increased from 5 to 8 bushels an acre by plowing immediately after harvest.

But this is usually the hottest and busiest season of the year when men and horses tire easily.

With the Cletrac Tank-Type Tractor you can actually plow *right on the heels of the harvest*—and do it so quickly that you will not interfere with cultivating, haying or other routine work.

Through the most extreme heat the Cletrac contentedly and steadily does a job that would kill a team. It will work all day and all night if necessary. You can drive it unmercifully—and in return get an *increased* yield of *better* quality, that will often pay the whole cost of the tractor in one season.

Prompt plowing after harvest enables your soil to soak up and store away moisture that would otherwise be lost.

But remember the Cletrac does far *more* than merely plow. That *is only the beginning of its work*. Its distinctive tank-type construction enables it to go almost anywhere—particularly over soft plowed ground or moist or sandy soil where the average tractor would flounder or "dig itself in". All the power of the Cletrac is used *to pull the implement*. And because of its 600 square inches of traction surface it doesn't leave two packed down tracks of earth behind it.

The Cletrac is extremely economical to operate, using kerosene, distillate or gasoline. Most owners are using kerosene or distillate.

Send for our booklet "Selecting Your Tractor". It will be a real help in solving many of your most difficult problems. And order early as we cannot promise prompt delivery later on.

Producing Perfect Milk in the Milk Contests

By D. O. Brant, Secretary California Guernsey Club

AT the Liberty Fair held in Los Angeles the Elliott-Brant Rancho produced what the judge considered "perfect" milk and cream and scored both products higher than any milk or cream had ever been scored before.

Just what was responsible for this perfect score and how it was attained is of interest to any milk producer who aspires to produce winning milk, either at the shows or on the market—the qualities to win at the show or on the market shall be, but as yet are not, the same unfortunately.

This statement may surprise some people, but, after a casual glance it is quite obviously apparent to even the layman. The point is that the score card, by which the milk judges have to select "the best" sample of milk from among those that are set before them, is out of date and is not capable of measuring "the best" milk as people understand it or desire their milk to be. This accounts in a large measure for the surprise people manifest when they read in the paper that the "dish water" they have been getting from their milkman has been scored about 95 per cent perfect out of a possible 98, which is the basis milk judges have used as perfect, which in other things is either 100 per cent or 1000 per cent. On the 100 per cent basis their milk is about 97 per cent perfect, and they know it is not so in their own minds. They can well remember the time when they were on the farm and they got milk from their old Jersey cow "as rich as cream" and the cream "as yellow as butter." That was "perfect" milk and cream to them; it still is their standard of perfection and they think either the authorities must never have been on the farm, or else they themselves, or the authorities, one, don't know what they are talking about. Perhaps it is some of both. I think so.

A full discussion of the milk score card is too long to be of interest to any except those especially interested in this important subject, but the gist of the thing is that the authorities are interested most in "clean" milk, paying slight attention to food value, etc., and so they express their desires on their score card by greatly exaggerating the cleanliness point of view, giving at present over one-half of the score used to cleanliness and about one-fifth to food value. Over one-third they give to measuring bacteria. While bacteria have no place or business in milk they allow your milk a perfect score if it has half a million in a quart bottle, which is not right. Perfect for bacteria should only be allowed when there are none in your bottle. When there is one your milk is contaminated, and certainly contaminated milk should not receive perfect. But even though your milk has many bacteria in it, are they the most important item to be considered? Has not their importance been overrated on the score card? It seems so when the same authorities encourage us to drink milk that contains millions on millions of bacteria, which they do when they tell us to drink buttermilk.

Mr. Authority, while he tells us butter fat is the most essential food on earth, absolutely necessary for all growth either in the infant or the adult, only allows this item ten per cent on his score card, and he cares not whether it is white, blue or yellow in color. He ignores its value further by giving a perfect score for the amount of butter fat in "average" milk, or four per cent. If you have less you get docked, but if you have more of this vital food do you get more? Nay, nay. But surely this chalky white milk, with the bluish tinge beneath, containing four per cent fat, does not score so much as this rich, yellow five and one-half per cent milk that looks like cream? Oh yes it does, probably more, because it may have 100 less bacteria. Yet who but an authority would select the white milk for his lunch?

On the other hand we have Mr. Consumer, Mr. Common People and family. They don't know anything about milk, or what's good for them, but what they are interested in is that old farm milk "as rich as cream," and the cream "as yellow as butter."

They don't understand this bacteria business anyway and never will. They'll take the authorities word for that, they want as few of them as they can get. What they want is that rich yellow milk with cream half way down the bottle so they can pour off the top for their coffee and berries and still have a real drink left for the baby. They are rather used to it but they would like it if those little green specks, the sediment, did not come down the sides of their glass with the last few drops of milk. They remind them of the barnyard and their absence is their idea of cleanliness, regardless of bacteria. They want rich, yellow milk that is clean, not clean milk that is thin and blue. They know, in their minds, the partly cooked and sterilized "distilled water" their milkman leaves them "ain't" 97 per cent perfect to them, regardless of what Mr. Authority says, and they are willing to show their choice by paying more for the yellow stuff if they can get it.

If Mr. Common People had a say he'd probably shock Mr. Authority by reversing the situation and give food value over half the score, half of what was left to good taste and what remained to bacteria and cleanliness. But he has not a say, so what he would say does not matter, except that, possibly, half way between what he would do and what Mr. Authority does is what should be on the score card for milk.

To succeed commercially the dairyman of the future will have to produce that "rich, yellow" kind of milk. At present he can "get by" without it because there isn't enough milk of any kind to fulfill the needs of the people, but that condition will, let us hope, soon pass by, and then those that have had foresight will persist, while those that are "getting by" now will perish. Those that have had foresight will have for sale the kind of milk people want and are glad to pay more for—those that have that kind now do not have to wait to reap their harvest—they never have a surplus, they get more for their milk and they can take the other fellow's business any time they can handle it. What will become of the other fellow, the thin, blue, three per cent fellow, when they are able to take over his business? In looking forward, as every man should, the dairyman should aim to arrive at the place where he is in a position to produce that "rich yellow" kind of milk just before the "thin blue" fellow passes out. It takes time to arrive at the point where the "rich yellow" is produced, but it comes more quickly than one thinks if he does not delay in his start. His herd of the future, the "rich yellow" herd, from the use of a pure bred bull of the breed that produces that "rich yellow" milk in the greatest degree will soon be his.

But why, if the richness and yellowness didn't count did the milk from Elliott-Brant Rancho receive the perfect score? The truth is that they kept the bacteria out by having everything perfectly sterilized and using the small topped pail just as the authorities tell us all to. They got rid of even the tiniest speck of sediment, which is the most difficult part of the work, by straining through layers of cotton between cheese cloth, again, just as we all are told to do, so that was perfect. Then the milk contained the "perfect" quality of fat with a per cent and a half to spare, and it was rich and yellow. It had a distinct nutty flavor, and while the score card didn't say anything about it and perhaps the judge didn't realize it, nevertheless he was human and he knew that that rich yellow milk pleased him more than the other "perfect" samples. If they were "perfect," then this must be "super perfect" and acting on this hunch he gave it an extra half point above the then usually perfect 98 per cent.

The answer to winning the milk contest at both the shows and in the trade is to own that "rich-yellow" kind of cows. They are scarce, but the bulls can be obtained reasonably and from them shortly springs the "super-perfect" herd. Need I tell the breed?

October 11, Kings County Poland-China Breeders' Consignment Sale, Hanford.
October 18, Trewhitt, Vaughan and Nehis, Hanford.
October 21, Tulare County Poland-China Breeders' Association, Tulare.

Messrs. W. A. Young and J. H. Lehman of Lodi have united in the purchase of a fine young Poland-China boar which it is expected will be a factor in production of gold medal winners.

Every constructive breeder has in mind certain types of animals he desires to produce. Walter C. Ficklin of Fresno, breeder of Poland-Chinas, says that with this in mind he has mated Choice Queen, a daughter of Wonder's King, the highest priced sow ever sold in California at public sale, with Madera Model, a son of the grand champion sow at the P. P. I. E. Also Busters' Supreme Wonder, a daughter of California Jumbo Buster, to The Yankee Jr. The Yankee Jr. is a son of Williams Bros. famous boar, The Yankee, and is heading the herd of the popular Poland-China breeder John Bernstein. Mr. Ficklin believes that the intermingling of this blood is bound to produce the right type of Poland-Chinas.

A recent addition to one of the leading herds of Poland-Chinas of the state, and one that will be of interest to all Poland-China breeders, is the new herd boar, Some Price, recently purchased by J. A. Crawshaw, Hanford. Mr. Crawshaw states that this boar, Some Price, is "some boar," whose dam is Orange Lady 2nd, and by Great Price, a half brother to Black Price, world's grand champion Poland-China boar. He is perfectly marked, being black with six white points, strictly big type and is from a litter of eleven. Some Price together with Kings' County Buster and California Gerstdale, a son of Gerstdale Jones, comprise the sires now on the Crawshaw raanch.

Probably no ranch is better adapted nor has better facilities for producing high class Berkshires than Mills Berkshire Farm, Hamilton City. On this farm is maintained a herd of 150 brood sows carefully selected as to type, size, individuality and prolificacy. The matings are being made by Mr. Ramsey, manager of the swine department, with the view of producing pork making Berkshires. One of the younger sires is a junior yearling by a son of Laurel Champion. He has remarkable depth and length, as strong a back as is ever found, stands on four good feet and if able to impart to his offspring his many good qualities, he is destined to become one of the great boars of the breed.

J F. Lehman, who breeds Poland-Chinas on his ranch near Lodi, states that he invites comparison of his herd with that of any to be found, and in making sales is willing to abide by the judgment of the purchaser. He has consigned five spring boars to the sale to be held by the San Joaquin Poland-China Breeders Association in Lodi, September 19, and states that they are the kind that will make real herd headers. He will show at the State Fair.

Sherwood Beckman, who has active charge of the large herd of Poland-Chinas on Lakeside Farm, Lodi, writes enthusiastically regarding the many additions of big type sows recently brought to the herd. It was at a long price that be was able to secure from L. H. Glover, a junior yearling gilt bred to Liberty Bond, but be considers that the litter by such a famous sire will more than return his initial outlay. The Lakeside Stock Farm will be one of the large exhibitors of Poland-Chinas at the shows this fall and will include its two herd boars, Matchless Big Bob and Lakeside Defender.

Eugene Miller will sell in the Lodi sale, September 19, a few of his big type Poland-Chinas. Mr. Miner bas reserved these especially for tbis sale, as he desires to assist in making his county, San Joaquin, a Poland-Cbina center and he believes that public sales will accomplish this more rapidly tban it could be done in any other way.

W. A. Young, one of the state's oldest Poland-China breeders, invites all interested in good hogs to inspect the get of his boar Golden State King, which he believes is the greatest breeding boar on the Pacific Coast. Mr. Young is negotiating for one of the best young boars he can find, and he will come from one of the best leading herds.

In the Duroc-Jersey show herd of W. V. Bennett, Nord, that will be out this season, will be found an aged sow, two junior yearling sows, her daughters, and four futurity pigs, also her produce. It is rare that we see practically an entire show herd made up from the produce of one dam. Ordinarily we would expect the dam to be past her show days, but she is in good condition to go on any circuit and make an interesting fight for premier honors.

To select one line of breeding and stick to it has been the policy of George Kounias, Modesto, breeder of Holsteins and Berkshires. Mr. Kounias has two farms, one of which is devoted to the breeding of Holsteins and the other to Berkshires. On the dairy farm he has recently completed a large barn with capacity for 100 cows, and a building for testing. His senior sire is the grand champion bull King Korndyke Hengerveld Ormsby 7th, and the junior sire is King Korndyke Aaggie Fayne whose dam, Finderne Soldene Fayne, produced 33.28 pounds of butter in seven days from 597 pounds of milk. In addition to the cows and heifers on test every female will be placed on test just as fast as she freshens. Due to the lack of housing facilities the herd of Berkshires was considerably reduced the past year. Just as soon as the new farrowing house is completed, along with a number of "A" shaped houses in the alfalfa pasture, the Berkshire herd will be considerably increased and pushed to the limit.

One of the interesting features of the Duroc-Jersey farm of F. D. Burr, Orland, is the concrete ditch through which the Durocs must pass in going from their feeding lots to the alfalfa pasture. The ditch is kept clean and sanitary by flushing every other day. Shade trees planted along the banks will in time provide ample shade during the hot months. Early in the year Mr. Burr began assembling this herd, which now numbers some 40 sows, two herd boars and 250 spring pigs. Mr. Burr intends purchasing 10 or a dozen as good sows as possible to buy. Mr. Burr also states that he has decided to sell no animal until it has been sufficiently developed to determine whether or not it has the quality necessary for a breeding animal.

R. J. Yates, enthusiastic Poland-China breeder of Orland, has instilled some of his enthusiasm into the farmers of his vicinity with the result that a number of them have gone in for Poland-Chinas. Tbe Glenn County Poland-China Breeders Association has been organized and plans laid for holding a public sale early next year. The association now has 25 members and some 50 head of Poland-Chinas have been secured for the sale. Mr. Yates is deserving of much credit for his efforts in establishing Poland-Chinas in his county.

Gordon H. True, Manager
San Francisco, Calif.

Stirling Spotswood Smith is establishing a first class herd of Duroc-Jersey swine at La Mesa, San Diego County.

Ralph W. Mitchell of San Diego has purchased a high class junior boar sired by the noted Great Model for service in his herd of Durocs. Mr. Mitchell is soon to locate permanently in the Imperial Valley country.

October 24 has been designated as public sale day at the Los Angeles Livestock Show for the California Holstein Breeders' Association, 50 head to be catalogued for the event.

The Duroc breeders of Los Angeles County have arranged for a meeting to be held at Van Nuys on Wednesday evening, September 17, for the purpose of organizing a strong local association. Dr. Michael Creamer, owner of Ireland Ranch, Owensmouth, is a leading spirit in this enterpise.

An exhibit of Polled Herefords from the J. D. Brunton herd at Aspen, Colorado, will be a unique feature at the Los Angeles Live Stock Show in October. The well known herdsman Kenelm Godfrey, recently returned from Scotland, will have this exhibit in charge.

A. M. Bibens, Modesto, has just sold two young Holstein bulls to come to Los Angeles County. One of them goes to the Los Angeles Creamery Company herd, the other to the Crescent Creamery Company herd.

J. C. Craig reports the recent purchase for his Owensmouth ranch of a 16 months daughter of Great Wonder I Am, noted as the largest boar of the Duroc-Jersey breed. This fine young sow is mated to Pathfinder's Likeness for an October litter. Mr. Craig has also placed an order for one of the best spring boars to be found in the Middle West. Another great young brood sow is likewise expected at an early day at a price close to four figures.

Out at Ireland Ranch, Owensmouth, Dr. Michael Creamer, proprietor, one of the good sales of the season is just now reported. Four fall yearling gilts are sold to T. P. Tupman, Bakersfield, at $150 each. These young sows are daughters of the grand champion boar Cherry Volunteer 2d, and they are bred for September litters to Ireland's Joe Orion. Ireland Ranch claims January 31 as red-letter public sale day. The junior yearling champion sow at Liberty Fair is reserved as "opening gun" for the day's doings.

The Elliott-Brant Rancho Guernseys at Owensmouth are to furnish one of the strong show herds at the big fairs this year. About 20 head of show cattle have been groomed for the occasion, so that all the leading classes are to be well filled. D. E. Simmons, who is the efficient herdsman here, was instrumental in laying the splendid foundation for these May Rose Guernseys about five years ago. The herd today numbers 175 head, with the great four year old sire Brookmead's White Face as first sire in service. No less than 40 of his get are in the herd today. He traces directly to the noted Imp. King of the May and Dolly Dimple, two of the greatest names in Guernseydom.

In the show herd of H. D. McCune, breeder of Poland-Chinas, Lemoore, will be seen the senior herd boar, Kings' Massive Orange. In this boar Mr. McCune believes he has a sire of more than ordinary ability, as his pigs are uniformly good and are in strong demand. The Poland-China business on the McCune farm is carried on rather extensively, as both his son and daughter are in the business and animals from all three herds will be seen at the fall shows.

Cross Bros. of Merced have for some time been gathering a herd of big type Poland-Chinas. They have been liberal buyers at a number of sales and have imported a number from the East, including a son of Golden Gate, a boar that did so much in the herd of A. S. Severe. They are at the present time negotiating for a son of one of America's leading sires and will this fall add a number of good sows to their present herd. They have made a few entries of young animals at the State Fair.

W. L. Haag & Son, Hanford, announce the purchase of a Grand Master sow from the herd of L. H. Glover, Grandview, Missouri, and bred for early September farrow to the sensational boar Liberator. In the show herd they will have out this fall is Young Jumbo, by Jumbo Bob, by Long Jumbo, the sire of the $18,000 Mabels Jumbo.

W. F. Sanderock, who a few years ago began establishing a herd of Berkshires on Natomario Rancho near Sacramento, takes considerable pride in the results of his efforts. Baron Duke 301st, grand champion boar at the 1917 National Swine show, and Rincon's Rival 2nd, grand champion boar at Salem, Oregon, the same year, are two of his herd boars. Numbered among the matrons maintained on the ranch will be found Princess Leader, a daughter of the grand champion sow of the world, Riverby Princess, and sired by Grand Leader 2nd, the grand champion boar of the world; also Riverby Princess 2nd and 3rd, two sisters of Riverby Princess and a number of others of equal caliber. Natomario Rancho will be represented at the fall shows by a herd of 26. Few collections of the breed can boast of Berkshires combining so high a degree of quality, type and showing records as will be found in this herd.

One who can always be depended upon to uphold the standard of his chosen breed is A. B. Humphrey of Escalon, one of America's most constructive breeders of Berkshires. The show herd this year under the management of Charley Maurer will consist of 21 head, among these being two senior boar pigs considered by Mr. Maurer the equay of anything ever bred at Escalon. Mr. Humphrey will also make a showing of 15 Guernseys.

H. C. Witherow, manager of Greenwood Farms, Live Oak, states that included in his show herd of Duroc-Jerseys this year is the junior yearling boar Johnson's Defender Jr. that is "making them all talk." That he will be well up in the money is the opinion of a number of breeders who have seen him. Greenwood Farm is making rapid progress in breeding the type of Durocs now in demand.

Nate Hauck of Alton, one of the pioneer breeders of big type Poland-Chinas, writes that he will be unable to attend the state fair this year, much as he would like to, as he looks forward to this event as a place to renew acquaintance with old friends and make a few new ones. Mr. Hauck is using as a herd boar Cantrell's Ideal by Big Joe and is mating him with a number of good daughters of Long Model, the sire of Model Fellow.

USEFUL FACTS

Doubling the diameter of a pipe increases its capacity four times.

One ton of coal is equivalent to two cords of wood for steam purposes.

A gallon of water (United States standard) weighs eight ond one-half pounds and contains 231 cubic inches.

A cubic foot of water contains seven and one-half gallons, or 1728 cubic inches, and weighs 62½ pounds.

Each nominal horse power of a boiler requires 30 to 35 pounds of water per hour.

To sharpen dull files lay them in dilute sulphuric acid until they are eaten deep enough.

A horsepower is equivalent to raising 33,000 pounds one foot per minute, or 550 pounds one foot per second.

The average consumption of coal for steam boilers is 12 pounds per hour for each square foot of grate surface.

A cable announces the death of Mr. John Cochrane, Nethercraig, Ayrshire, Scotland, one of Scotland's foremost Ayrshire breeders and judges and the pioneer exporter of the Ayrshire breed.

This little world of ours is not growing worse to the men and women who are doing their best to make it better.

RUSSELL FOR QUALITY AND DEPENDABILITY

SPECIFICATIONS

Russell "Big Boss" Tractor

Rated Tractive Horse Power	20
Rated Belt Horse Power	40
Number of Vertical Cylinders	4
Cylinder Bore, inches	5½
Piston Stroke, inches	7
Motor Speed	825
Plowing Speed—Miles per hour	2.4
High Speed—Miles per hour	3¾
Make of Clutch	Russell
Type of Clutch	Two Shoe
Type of Governor	Throttling
Number 14-inch Plows Recommended	4 to 5
Diameter of Belt Pulley	12½
Speed of Belt Pulley	840

RUSSELL "BIG BOSS" TRACTOR 20-40

Wheel Base	9 ft. 2¾ in.
Length over all	13 ft. 6 in.
Width over all	5 ft. 5⅛ in.
Height over all	7 ft. 6 in.
Number of Speeds Forward	2
Draw Bar Pull (low speed)	4,000 lbs.
Diameter of Rear Wheel	60 inches
Face of Rear Wheel	16 inches
Diameter of Front Wheel	32 inches
Face of front wheel	7 inches
Face of Belt Pulley	8 inches
Weight (rear wheels smooth)	7740 lbs.
Weight on Front Wheels	2730 lbs.
Weight on Rear Wheels	5210 lbs.

A. H. AVERILL MACHINERY CO.

SAN JOSE CALIFORNIA

A Great Show

By Gordon H. True
(Special Wire Service)

THE California International Live Stock show is dedicated to the proposition that the Pacific Coast is potentially America's great breeding ground for improved live stock and that the world should know it.

While San Francisco interests have made the show possible the idea has been developed as the result of a long felt demand of the stockmen of the state for a show of national character that would adequately represent the accomplishments and possibilities of live stock production of the West.

The show will be housed this year in the California Building at the exposition grounds. The building is being fitted up at considerable expense to accommodate an exhibit equal in proportions to the largest show we have seen on the Coast. Freight transportation is available direct to the building, and it is planned that passenger traffic shall be equally convenient.

The premium list provides for all classes of live stock. Announcement of entries has already been received from as far East as Kansas City and Illinois.

Stockmen of California will be glad of the assurance that the plans of the management look to the establishment of the show on a permanent basis. The Pacific Coast furnishes wonderful opportunities for the development of the pure bred live stock industry. It has not been a mere chance that horses from the stables of Stanford and Haggin and others, from the days of those pioneers down to the present, have been record breaking animals. It is not a matter of chance that such a large number of high milk and butter fat records have been made in dairy herds of the Pacific Coast. It has not been by chance that Coast cattle of the beef breeds shown in competition with those of the Middle West have won such high places. It is not a matter of chance that Coast bred hogs have won at the National Swine Show and have been sought by discriminating buyers. Nor does it just happen that breeding sheep from California are to go to South Africa, thus breaking into the Australian trade in the highest priced class of sheep produced.

It is to put the position of this Coast country properly before the world that this show is given.

Judges of national reputation have been secured for all classes, assuring exhibitors an intelligent adjudication of their entries and to the spectators a course of instruction as thorough and extended as the time they give to following the work of these men.

Hog Cleanliness the Key to Success

Says a writer in The Duroc Bulletin:

"Several live stock men were recently discussing the various phases of production of live stock, and the statement made by one of the party that hogs were the most cleanly in their habits of any live stock brought forth pitying, incredulous smiles from these of the party not directly in touch with swine raising. But even though it is hard not to associate the time worn expression, "dirty as a pig," with the hog itself, the fact remains that a hog will go out of his way to keep himself and his quarters clean. He thus invites the virtue of cleanliness in his handling that tends to make his development the most profitable of any live stock production.

"Cleanliness simply means thrift and economy in production. Freedom from internal and external parasites that not only keep the animal in a condition of low vitality and thrift, but also mean many extra mouths to feed, would add thousands of dollars to the annual income of swine growers the country over. There is no other animal that is subjected to the filth in living conditions that is so generally accorded to the hog—his production is in the rut of long established, but poorly founded precedent of method. and the time has come when the demand for the products of the hog makes it imperative that those methods be employed which mean that every pound of feed given to hogs will bring back full value in pork products, without the usual attendant 'side lines' of lice, worms and disease.

"There are very few swine ailments that cannot be avoided by the practice of sanitation and cleanliness. The swine pens and yards should be so situated that they will not present the continual appearance of a cranberry marsh, but should be well drained and on high and sloping land. The sleeping quarters should be dry, free from drafts and well ventilated. This is doubly important in the case of sows with young litters. Improper sleeping facilities will often cause pleura-pneumonia among the young pigs, which invariably proves fatal or, worse yet, causes stunting and consequent unprofitability.

"The houses should be cleaned out at least once each week and the pen and house thoroughly disinfected with a good coal tar disinfectant. And it should also be known that lime is one of the best disinfectants known, and a liberal use of this easily obtainable product is one of the best possible safeguards to the health of the hog herd. Its low cost is no criterion by which to judge its worth.

"The use of a plentiful amount of good dry bedding is a very inexpensive way of increasing the gains made. There is no feeder who can make a dissatisfied hog gain as desired, and there is no better way on earth to make a hog contented than to keep a good warm bed ever at his disposal. Good sanitary concrete wallows should be provided if possible in lieu of the long-tolerated, disease-breeding mud wallows. By keeping the water in the wallow sprinkled with a coal tar disinfectant or crude oil disease breeding germs may be kept out.

"External parasites such as lice and mange are a very effective means of keeping away profit on hog feeding. Not only do they draw their existence from the hog, but they lessen the animal's resistance to disease. The only positive and economical way to keep these pests under control is to keep them out of the herd. This may be done by dipping or spraying with any standard coal tar preparation, or by the use of rubbing post oilers. And the important thing is to keep the pests off the hogs—dont' let them get a start.

"By far the most costly of the elements that tend to make hog production less profitable is the prevalence of worms. All hogs have worms, some more, some less. It is a proper part of the cleanliness campaign to eliminate them by the use of some good worm expeller, formulas for which are ever available for any farmer. But it is much more effective, as well as a great deal cheaper, to keep ashes, charcoal and lime, together with some good condition powder or worm preventive, ever before the hogs in self feeders. The added growth and profit will repay the cost many times over.

"Go fifty-fifty with the hog. Be as clean with him as he is willing to be for himself. If you will give him opportunity he will prove that it will take less time and work to keep him clean than it will to keep clean any other farm animal."

At a sale of Jersey cattle held by Edmond Butler at Mt. Kisco, New York, 48 head of bulls and females sold for $158,800, an average of $3008, which is a new record for the breed. The imported bull, Sybil's Gamboge, sold for $65,000 to L. V. Walkley of Connecticut. This is the record price for a Jersey bull. Two females, Sybil's Oxford Dora and Fern's You'll Do Fontaine, sold for $6500 each.

4th ANNUAL TRACTOR AND IMPLEMENT DEMONSTRATION

· 1919 ·

SEPTEMBER 16th. TO 21st. INCLUSIVE

NO ADMISSION CHARGES

FREE PARKING SPACE

GOOD MEALS ON GROUNDS

MELROSE AVENUE and CRESCENT AVENUE LOS ANGELES

Diamond G Herefords

As Good as the West Affords

Introducing

Don Perfect 2d.

Don Perfect 2d.

our new herd buil. Don Perfect 2d was secured this year after a careful search for a herd bull of the highest order. He was sired by the great breeding bull and International champion, POINT COMFORT 14th, and comes to this herd with an established reputation as a sire of great ability, made in one of the best herds in Iowa. He has been used on nearly all our breeding herd and his calves will be in offer next year.

Herefords are Money Makers—Diamond G Herefords Represent the Best

Scrub bulls must go—replace them with sons of Don Perfect 2d.

Range men should investigate this herd when in need of bulls. Inspection of the herd is invited. Ranch seven miles North of Esparto.

H. H. Gable

Esparto Calif.

When Buying Herefords

Bear In Mind

That Bunting-Bred Herefords

1. HAVE SIZE—From the inception of this herd it has always been insisted that size is one of the most important factors from the standpoint of the practical cow man.

2. HAVE BONE—There is no place in the Bunting herd for light boned cattle. We know that Western men want bone and we have selected and bred our cattle for bone.

3. HAVE CONSTITUTION—Constitution has always been a marked quality in Herefords—no breed has more. No herd has more than the Bunting herd.

4. HAVE THE BEST OF BREEDING—The best in Herefords can only be produced from the best of breeding. That is why Bunting Herefords make good on the range and in the show rings.

5. ARE PROFITABLE—Because of the above points Bunting Herefords fulfill every requirement for profitable cattle and are therefore profitable — the kind you want.

YOU WILL BUY BUNTING HEREFORDS.

Opportunities for the Small Hereford Breeder

By John A. Bunting, Secretary, Pacific Coast Hereford Breeders' Association

THE small breeder of today is in a position to do a great deal of real constructive breeding to better advantage than a large breeder.

Not long ago I met a man who, with a partner, had bought a farm of 700 acres. This man favored starting a purebred registered herd, but his partner objected for three reasons: First, that purebred cattle were not healthy and did not do well under adverse conditions; second, that a small herd of registered animals could not be run at a profit; and third, that it required a great deal of capital. The partner had a badly mistaken idea regarding registered cattle, especially Herefords.

Purebred cattle are really a lot healthier than scrubs, and the Hereford is far superior to all others in this respect. It is an undisputed fact that Herefords are the greatest rustlers and are the best in the feed lot, as the quotations almost always show Hereford feeders bringing from 50 cents to $2 per hundred more than any other breed, and they are also the most immune to tuberculosis.

A small herd of cattle can be run with a great deal of pleasure and profit. In a small herd a breeder can carry fewer cattle and more quality easier than in a larger herd. It is better to have an animal of quality than three or four of inferior type. A breeder should never loose track of the type that suits him most, and must never forget to keep quality with type first in his mind. A small breeder has a better chance to study each animal individually and find out its weak as well as strong points, and he may profit by his knowledge of each animal.

A breeder of a small herd can give his animals more time and care. This word care will no doubt bring a great deal of criticism. When I say care I mean plain common sense feeding and a little shelter. Calves most certainly should have a little extra feed and shelter during the winter, and the yearling as well. The older cattle can take care of themselves better than the younger. It is surprising what a little extra feed and shelter will do for an animal in bad weather. Last winter my cattle never had a look at a shed; they merely had a little volunteer hay given them every other day. To allow a calf to go without feed is one of the worst mistakes that can be made. It has been proven over and over again that the cheapest gain a person can put on an animal is when it is a calf. Not only that but a calf that is once stunted for the lack of feed will never regain the loss. These facts are easier for a small breeder to contend with than a larger one.

I have heard cattlemen say that they just let their cattle rustle for themselves and did not want cattle that had to be fed. The Hereford is the peer of all cattle when it comes to rustling, but a man who makes his cattle rustle all winter for feed would be surprised at the difference a little feed would make to these same animals. It never pays to let an animal fall back, as it takes twice the feed to get it back into shape that it would to carry it along in nice flesh.

Regarding capital to start a purebred herd of registered Herefords, it depends on how large a herd a person wants to start with and the quality he wants. A large herd of high class females and a real herd bull cost considerable, but if a man wants to get into registered Herefords on a small scale it is not very costly or hard, providing he has a little patience and is willing to take his time. It is surprising how a herd will grow with a start of two or three cows or cows with calves at their sides and rebred. It does not take a great number of cows to start with, providing the breeder is willing to let his herd grow from a small beginning.

I know of no better way to illustrate what I mean than to take two cows of my own for an example, what I paid for them, the number I have in 30 months and their value, and to state what I really could have afforded to pay for these cows: In 1917, when cattle were cheaper than today, I bought from the university farm a cow with a heifer calf at foot and rebred. Today the cow is worth at least $600. The calf that was at her side is a two year old and is worth $750 easily. The calf she was carrying is now a yearling worth $500 and she has a calf at side ready to wean, that is worth $300, and is safe in calf again. To sum up the profits from this cow, my original investment was $425, the plant today is one cow and three heifers valued at $2150.

The second cow with calf at foot and rebred was bought at auction for $590. This cow could not be bought at all today. We will call her value $750. The calf at foot is now a two year old heifer that I refused $1200 for when 17 months old, and I would not take $2500 for her today. Call her worth $1500. The calf the cow carried is now a yearling bull, and I refused $500 for him when eight months old. He is worth $1000. The cow has another bull calf at foot that is nearly ready to wean, that is a real calf, and we will say he is worth $750. The summary of this cow on an investment of $590 consists of one cow, one heifer, and two bulls, and their value today is around $4000. From two cows in May 1917, with calves at foot, I now have six cows and heifers and two bulls from an original investment of $1015 to $6150. Not bad for buying two cows about 30 months ago. This proves that they grow fast both in number and money.

A question often asked is: "How much can I afford to pay for a cow?" I believe that $1250 for the first cow and $2500 for the second would be a good buy. There are not many of us who cannot buy one or two good cows to start with. A breeder with a small but select herd can and will find it very interesting as well as profitable

In a small herd a breeder often thinks that he cannot afford to sell his surplus animals. This has been solved to a certain degree by the Pacific Coast Hereford Cattle Breeders' Association which was organized in 1916. This organization is to promote the interests of the Hereford breeders on the Pacific Coast by better acquaintance and a cordial relation among breeders of Hereford cattle, by the holding of public sales, and by promotion of exhibits at the state and county fairs and the live stock shows in general.

Any one who is a breeder of registered Herefords on the Pacific Coast is eligible to become a member of this association. This entitles him to place his surplus stock in the public sales which will be held as often as seems advisable. A small breeder of registered Herefords of quality, is sure of a winning proposition.

Los Angeles Live Stock Show

Premium lists for the Los Angeles Livestock Show, which will be held at Exposition Park in Los Angeles from October 18 to 26, are now ready for distribution at the office of secretary and manager C. R. Thomas at the Chamber of Commerce.

With an attractive program, ranging in variety from hundreds of exhibits of all breeds of livestock, poultry and pure-blooded animals to a harness and running race meet and a driving and saddle horse show, there will be nothing lacking to satisfy the interest and enthusiasm of the most exacting fancier or casual spectator

Prize money of $55,000 has been pledged, and of this sum $35,000 has been set aside for premiums and $20,000 for racing purses.

Judge Ed R. Smith, the veteran turf official, has been placed in charge of the sulky drivers and baugtails and he has announced a card of 12 top-notch harness events in addition to two daily running races. National Trotting Association rules will govern the trotters and pacers, with an

entrance fee of five per cent and five per cent from money winners. Running owners will be required to pay three per cent of purses, with events open to all. The $500 Live Stock Show derby will be a feature of the racing program. Entries for all events will close September 20.

In announcing the completion of the premium list Manager Thomas said:

"In presenting the premium list of the Second Annual Live Stock Show to be held in Southern California, the directors of this enterprise wish to assure exhibitors, breeders and the public that no effort has been spared to make the display one that shall reflect the best in every phase of the farm stock industry.

"While Southern California offers various advantages in breeding, it has not been until recent years that systematic, coordinated effort has been made to bring its herds to the high standards set by the older communities of the nation. It is believed that the second annual show will demonstrate conclusively that a wonderful beginning has been made toward bringing Southern California stock to the highest class to make it rank with the horticultural and agricultural products of this section.

"Our shows are cooperative enterprises designed to stimulate breeders to better efforts and to educate the people at large to the full meaning conveyed by the word "thoroughbred." We trust that exhibitors and the public will meet us in the same spirit and with equal enthusiasm in the cause."

Ample accommodations have been provided at Exposition Park for the largest herds and stables, and the location in itself is regarded as an important factor in assuring the success of the exhibit. It is in the heart of the city, with several five cent fare car lines tributary to it and spacious, paved automobile boulevards on all sides. Women and children visitors will encounter none of the hardships common with suburban locations as the modern, permanent pavilions at the park provide every comfort and opportunity for rest and recreation.

Every department and classification of beef cattle, dairy cattle, draft horses, saddle horses, mules, jacks, ponies, swine, sheep, goats, poultry, pigeons and rabbits will be judged, and substantial cash prizes have been provided for all. A special feature of interest to all breeders will be a public sale to be conducted by the California Holstein Breeders' Association at which from 40 to 60 head of the finest dairy animals in the West will be auctioned. The California Dairymens' Association will also maintain an elaborate exhibit at which milk foods and milk drinks will be distributed to the public and where everyone may obtain the most up to date information on dairy methods and intensive milk production.

The officers of the Live Stock Show are: E. W. Murphy, president; Clinton E. Miller, Walter P. Story, vice-presidents; C. R. Thomas, secretary and manager; Irving Hellman, treasurer.

The directors are: H. A. Jastro, L. M. Cole, F. E. Lewis, 2nd; Chas. H. Hill, Frank Simpson, W. I. Hollingsworth, H. B. Woodill, George M. Brown, E. W. Murphy, Clinton E. Miller, Fred H. Bixby, Harry Chandler, Frank Wiggins, Irving Hellman, Harold Braly, Walter P. Story, Walter M. Ross.

The members of the executive committee are: Fred H. Bixby, Frank Wiggins, H. A. Jastro, Harold Braly, Chas. H. Hill.

Why Herefords?

By J. I. Cazier, President, Pacific Coast Hereford Breeders' Association

TODAY, perhaps more than at any other time in history, there is the question, "Why?" Efficiency has been sought not only in the production of war munitions and equipment but in every line of industry. In the production of our foodstuffs efficiency has also become of utmost importance, and it is during this searching period for efficiency in food production that the Hereford has come into the greatest favor. It is not that it has just recently come to the top, but it is the critical comparison with other beef breeds that has brought the present recognition.

For efficiency in turning the vegetation of our vast open range into the finished product the Herefords have no equal. They have stood the test under the most trying conditions and have not been found wanting. There is no other sire so prolific as the Hereford and none other that will make the same improvement on our ordinary range cattle. The Hereford cow, though she has been criticized as a producer of milk, has that characteristic of bringing her calf through in better condition and at the same time retaining her own flesh to a higher degree than a cow of any other breed. This characteristic is very valuable in a range cow.

When we look into the purebred market we find Herefords at the very top. During the last year Herefords have set a world's record price for a single bull, a cow, a calf and a record sale average.

When we see breeding stock at the top we know there is a reason why. And when we review the fat stock market, the place where our beef breeds are finally appraised, we find Herefords again at the top. We find them at the top both as finished beef and as feeders.

This again brings the question, Why? And it is right here that the Herefords come to the front. The packers are not paying the premiums simply because the cattle have white faces but because by careful comparison the Hereford has proven to be the superior beef producing animal. Another factor very much in favor of the Hereford is its comparative freedom from disease. This also means dollars to the packer.

Figures taken from a bulletin of the bureau of animal industry credit Herefords with only 1.09 per cent of reactions to the tuberculin test, and other breeds run as high as 41.25 per cent of those tested. Quite a difference in favor of the Hereford.

When we come to the feeder we find that the Hereford not only matures early but conditions readily at any age. This gives it a foremost place in the production of baby beef.

Until late years our most productive lands were considered too valuable for cattle pasture. They were used for the growing of grains, fruits, etc. But since the improvement in the beef producing qualities of our modern Herefords they are proving a most valuable crop. We have found that they yield immediate returns as well as keep up the productiveness of the soil. And not only do they keep up the productiveness but there is no better or more profitable means of bringing up the fertility of our run down, or crop worn, lands than the production of Herefords.

They have proven themselves on our most rugged ranges and under the most trying conditions, and now they are proving the efficiency which gives them their place on our most valuable lands and warrants their handling of our most expensive feeds. Thus we find where scientific methods are pursued and efficiency is carefully considered from the range to the consumer, that the Hereford is given foremost place in the production of beef.

The Nevada HEREFORD RANCH

Has for fifteen years given its best efforts to the production of high class Herefords. During these years we have endeavored to work to one end; the production of the most efficient beef producing animal.

WE HAVE EMPHASIZED THE IMPORTANCE OF SCALE AND BONE

The $10,000 Beau Blanchard 76th at 10 months old

Herd Bulls

THE SELECTION OF OUR HERD BULLS HAS BEEN MOST CRITICAL BOTH AS TO PEDIGREE AND INDIVIDUALITY. At the present time we have at the head of our herd, HARRIS STANDARD 2nd, 425030, BEAU BLANCHARD 76th, 685487, DEBONAIR 64th, 616840, NEVADA LAD 8th, 697062. Four splendid sires that we believe are among the best that the breed produces. The cut of Beau Blanchard 76th shown above was taken at ten months and does not do him justice as he stands today.

Up to the present time we have offered only a few head of females for sale but we have now reached our pasture limit and are offering over ONE HUNDRED HEAD OF CHOICE COWS AND HEIFERS. They are all producing age and are bred to our herd bulls. Some have calves at foot and are rebred. They are a valuable lot of breeding stock and are offered at a very attractive price.

Studying Arizona Ranges

By M. E. Bemis

SOMETHING unique in agricultural short courses is being tried by the agricultural extention service of the Arizona college of agriculture this summer. Arizona is a big state geographically. Most of its many millions of acres is classified as grazing rather than agricultural land, notwithstanding that in the irrigated sections, the land produces crops second to none both in quantity and quality.

These vast areas of grazing land, varying as they do from the deserts, some of which are only a few hundred feet above sea level, to the plateaus of the north that are more than a mile above the level of the sea, present to the student a change in range conditions more marked than is found in states widely separated. The cattleman near the southwestern border has little in common with the man who is growing cattle or sheep in the mountains of Yavapai or on the plateaus of the painted desert country along the old Santa Fe trail near the northern boundary of the state.

Plastered and Lath Silo

Range squad looking at plastered silo, Salt River Valley Experiment Station.

As a means of studying the range and live stock conditions someone conceived the idea of a tour of the state in autos, making flying visits and brief stops with prominent stockmen in all parts of the state, seeing and hearing at first hands. This years' "live stock squad," as it is called, is experimental, and no one can say until it is completed and results analyzed, just how successful it will be or just what will be necessary to make next year's and succeeding years squads larger and more successful. At this time it seems very probable that it will be a permanent feature, but from the experiences of this season there will be evolved a method of handling the squad most efficiently and with greatest dispatch.

The squad is under the immediate direction of Dr. R. H. Williams, animal husbandman of the state agricultural college, and Capt. C. U. Pickrell, extension live stock specialist. Several members of the faculty of the college are accompanying the party as students though their technical knowledge in their respective branches is of material assistance. As this is in a way an experimental trip it was felt advisable to keep the number down to a minimum for this season, so the number of students was held at ten. Probably next year will see a considerable increase.

The trip began at Tucson, Monday August 11, visiting the great Continental Rubber plantation on the road to Nogales, and later to the Santa Rita Range reserve, where under the direction of the national forest reserve there is a fenced area comprising 50 sections. This was fenced in 1904, and at that time it required 60 acres to support one cow. At the present time, with range control, 20 acres will feed a cow in better shape than six did when it was first fenced. The Empire Ranch and the Rail-X Ranch were also visited.

At the San Rafael Ranch the students were given an opportunity to see in operation one of the largest pure bred Hereford cattle ranches in the world. This ranch is an original grant and comprises 20,000 acres divided into 27 pastures. The heifers on this ranch are kept in Mexico until two years old then taken to the home ranch and bred. Careful records of all breeding and the birth of calves are kept. Methods of keeping these records were explained. Swinging around a circle the students visited several ranches to the south and east of Tucson, returning to that city August 14. From Tucson the long journey into the northern ranges was begun August 15. The first day out the itinerary included several ranches, with brief stops at Mammoth and Oracle, following down the San Pedro River to Florence.

Near each county line the squad is met by the county agricultural agent of that county, and he accompanies it through his county. It was my privilege to be the guest of County Agent Heard when he took charge of the squad upon its entrance into Maricopa County. The Goodyear Cotton plantations en route from Florence were passed on the road to Chandler. Cotton to a range student is, of course, of only minor interest, but the by-products of cotton, cotton-seed meal, cake and hulls are of more and more interest as it becomes necessary to supply supplementary winter feed on the ranges or to finish cattle for the market.

The principal things of interest to the students in Maricopa County were the feeding and breeding farms. As a rather welcome change from chuck box rations, the students parked their autos on one of Mesa's broad streets and ate lunch at a restaurant. The Tweedy Ranch south and east of Mesa was next visited. Here about 300 steers are fed through the winter and some kept the year around. One of the interesting sights on this place was the trench silo. This is similar to a trench silo which I described for Cultivator readers several years ago. This silo is 150 feet long, 14 feet wide and 14 feet deep. The soil is rather heavy so that there is no trouble from caving, consequently cementing the sides has not been necessary. The silage is cut into the pit and a team with a scantling drag distributes it and tramps it. When full it is covered with straw and thoroughly wet and tramped. The spoilage is very small. In feeding a wagon is backed down an incline and loaded, the silage being cut down across the end instead of the usual method of feeding from the top. This is a cheap silo to build to fill and to feed from. The capacity of this one is 700 tons. Mr. Tweedy finds that there is most profit in feeding three year old steers. He feeds silage, alfalfa hay, ground milo and cottonseed meal. The students gave Mr. Tweedy close attention, taking notes on his methods.

At the state experiment farm west of Mesa the metal lath plastered silo was inspected and the construction explained by Superintendent Woods. This silo, which has the appearance of monolithic concrete, is considerably cheaper to build and is claimed to be just as satisfactory. The capacity of the silo at the station farm is 125 tons, and it is said that it can be put up now for $500. The sheep feeding pens at the station farm were inspected and results of last winter's feeding experiments given. Some 200 ewes were fed, ten different rations and combinations of feeds being used. Straight silage, which is a popular feed among sheepmen, has been found to be too fattening and does not give as good results as a combination of silage, alfalfa hay and some concentrated feed like barley and cottonseed meal. Speaking of silage for sheep, one sheep owner paid as high as $25 per ton for silage a year ago last winter. Ten dollars per ton is not at all uncommon and some are now contracting, for next season's feeding, silage at $8 to $9. One man is reported to have contracted for corn in the field at $4.

From the experiment farm the squad went to the Pollock Mule Farm

where a considerable number of mares are kept exclusively for raising mules. Some splendid young mules of all ages from four weeks to four years were seen. Mr. Ed. Hendricks, foreman of the ranch, gave an interesting talk to the students.

The Bartlett-Heard Ranch, where several hundred head of Shorthorns and Herefords are kept for breeding, was next visited. Bulls from this herd find a ready sale to range cattlemen at good prices. On this ranch is a battery of cement block silos, the capacity of each being 250 tons.

Other things of interest to the students in Maricopa County were the 400 ton silos on the Burnt Ranch near Glendale. These are built of cement staves. There are two of these big silos on each end of a feeding shed an eighth of a mile long. Here 1500 head of yearlings are finished for the market each winter. The desert country to the north and west of the Salt River Valley where a half million sheep are wintered and the shearing sheds where they are sheared were next visited.

Entering Yavapai the points of interest are the big goat ranches near Skull Valley and Kirkland, and the cattle ranch of C. P. Mullen, president of the Arizona Cattle Growers' Association. Dry farm methods will be studied on the farms near Prescott. The squad will traverse the Williamson Valley, then on to the big sheep ranches near Ash Fork. Several sheep ranches on the road to Williams where the Rambouillet sheep are raised are points that will furnish no little interest and instruction to the students.

Sheep and cattle ranches along the rim of the Grand Canyon afford a combined study of nature and ranching under conditions unlike those found anywhere else in the world. Some experiments of the biological survey in the extermination of prairie dogs will be studied. Two great national forests, the Tusayan and the Coconino, have headquarters on the route, one at Williams and the other at Flagstaff, and an opportunity for studying the methods of leasing these lands for grazing will be given.

The route leads along the Santa Fe over the plateau country to Winslow and Holbrook, thence south through St. Johns and Springerville, through the White Mountains to Globe, with an opportunity of visiting some well known cattle ranches. A public meeting will be held at Globe and another at Fort Thomas on the road through the Gila Valley. Some of the large cattle ranches in Graham and Cochise Counties will be visited, and with a visit to the dry farms of the Sulphur Spring Valley the squad will head back for Tucson, arriving September 6.

So far the schedule as laid out has been closely followed and unless unforeseen circumstances make a deviation necessary it will be closely adhered to.

All in all this range course seems well worth while. To the cattleman who needs some information about the ranges in other parts of the state it is a splendid opportunity and in addition it gives him a chance to learn methods of men that have made a success under circumstances and conditions where methods had to be studied and worked out. Many points are brought out at these meetings and discussions that would not be known otherwise. My guess is that the applications for the 1920 course will be considerably oversubscribed.

Roselawn Shorthorns

One of the Oldest Herds in the West

Roselawn Champion

In our herd bull shown above, ROSELAWN CHAMPION, it is felt that we have a bull that is destined to write many brilliant pages of Shorthorn history. The breeding back of him is such as to give the greatest assurance. He was sired by the great breeding bull, EASTLAWN CHAMPION, a son of the Scottish winner, CHAMPION OF SCOTLAND. His dam MISCHIEF E 3d, was sired by VILLAGE BRIDEGROOM and her dam was MISCHIEF C, a daughter of DIAMOND REX. At the 1918 State Fair, ROSELAWN CHAMPION was junior champion and his dam was grand champion female.

Head your herd with a son of ROSELAWN CHAMPION—and be at the Front.

I Sell 45 Select Shorthorns Oct. 16

Many will be Bred to Roselawn Champion

H. M. ELBERG : Woodland, Calif.

Jack London Ranch

SHORTHORNS

The herd was founded with choice selections from the better herds of America, and has been managed in such a way that the improvement from year to year has been notable. For a number of years London Shorthorns have been conspicuous in Western show rings, and at the spring sale, held at Davis, this herd furnished the top consignment—averaging $1090. For Shorthorns of quality, prospective purchasers are invited to investigate this herd. At present, LONDON'S VILLAGE BEAU, a straight Scotch bull, sired by SITTYTON ROAN SULTAN and out of VILLAGE PRIDE 2d, a granddaughter of VILLAGER, is at the head of the herd.

SHIRES

The stud of Shire horses was established with especial regard to producing a class of horses that would meet the demand of the particular buyer. Much of the blood of Neuadd Hillside, three times champion at the California State Fair, is represented in the ready to use stuff, both stallions and mares, that we have to offer.

DUROC-JERSEYS

At all times we have a choice lot of Duroc-Jersey boars and gilts on hand that we offer at prices that are most attractive. The breeding is the kind that has proven to be most prepotent.

ELIZA SHEPARD, Manager — WALTER D. BUNNELL, Herdsman

Glenn Ellen (Sonoma County) Calif.

lovers of Shorthorns

are particularly invited to inspect, in our exhibit at the State Fair, several daughters of **Pacheco Lad 58th.**, a son of **True Dale.** **True Dale's** record as a sire of prize-winners in well known—that the ability to produce good ones does not end with him is proven by his granddaughters. We are confident that the improvement in our herd wrought by **True Dale** will be continued in even greater degree by **Pacheco Lad 58th.**

Some California Shorthorn Steers

By C. N. Hawkins, President, California Shorthorn Breeders' Association

Editor's Note: The following article by Mr. Hawkins, who is president of the California Shorthorn Breeders' Association, appeared in a recent number of The Shorthorn in America, and is published here through the courtesy of Frank D. Tomson. Through the use of registered Shorthorn bulls the Pacheco Cattle Co., managed by Mr. Hawkins, has succeeded in greatly increasing the weight and quality of the steers sold. Good bulls present the surest method of increasing cattle profits.

LAST February we had the very great pleasure of a few days' visit at our California ranch from Mr. and Mrs. C. D. Bellows. Needless to say we gathered enjoyment as well as profit from the visit. I don't mean by "profit" that we kept Mr. Bellows' pocketbook when he went away, but we profited by the advice and encouragement and inspiration of an experienced and successful Shorthorn breeder. I do not know of anything more helpful or more appreciated by the pioneer out on the fringe of creation than visits from the masters of the breed.

Mr. Bellows was much surprised, as are all Eastern visitors to California, to find fat cattle on the open range in the middle of winter, cattle that had never been in a barn or had a pound of grain in their lives, or even hay, except for a short time after weaning, absolutely grass fed and grass fattened.

And so it happened that when Mr. Bellows ended his visit to California and returned to the ice and snow of his beloved Missouri, he told your editor about the "wonderful" grass steers he had seen at our ranch; and as editors have to fill their publications in the easiest way possible, I am trying to accede to his request for a "story of the steers."

But there is nothing so very wonderful about the steers. The wonderful California climate and grass made them possible, and what we have done in taking advantage of what nature has thrown in our way can be done anywhere in California where the climatic conditions are favorable.

To begin at the beginning, when we acquired the ranch about 12 years ago we were not satisfied with the kind of bulls obtainable for the range. The cows were just a fair, ordinary bunch of California cows of all kinds of breeding, but showing perhaps more Shorthorn than any other blood. After worrying along for a couple of years we decided to breed our own bulls, and about ten years ago bought a little bunch of registered Shorthorns. As a consequence the grade of our range cows improved rapidly and all of our range calves for several years have been bulls. The best of breeds is reason number one for the "wonderful steers."

Next we fenced and cross-fenced the ranch so as to provide separate fields for different ages of cattle, both cows and steers. This enables us to make use of our rougher ground for the younger stock and to have a surplus of grass for the beef feeders. We try to stock reasonably light and to have plenty of feed for all our cattle and an extra allowance for the beef. Plenty of feed is reason number two for the "wonderful steers."

In California we have about six months of green grass and six months early in the winter, so that cow and calf both get the fullest benefit from the green grass. The calves are weaned about August and fed alfalfa hay for a few weeks and then allowed to run in a field of wild hay for two or three months. This is the only time in their lives that they get any hay. About November the steer calves are moved into the "yearling" field, the second year into the "two-year-old" field and the third year into the "beef" field, where they stay until sold. On June 15, we delivered about 153 three-year-old steers which averaged weighed full 1515 pounds. This compares with the usual weight of California cattle of the same age from 1100 to 1250 pounds.

Many good judges have pronounced these steers to be the best and heaviest lot of straight grass-fattened cattle they have ever seen. Needless to say the same result could never have been obtained by using bulls of any other breed. It takes the mother's milk, the scale, the easy-keeping quality of sensible disposition of the Shorthorn to produce the maximum results.

Southern California Fair

The Southern California Fair which will be held at Riverside October 7 to 11, promises to far surpass any of the previous meetings of this association in its seven years of successful experience. Preparations are being made to double the present capacity of hog and cattle pens and some wonderful herds will be shown. Pure bred dairy stock in Southern California counties has been increased in the past few months by a number of important shipments from the East, and the best specimens of this will be shown. In the swine department Duroc-Jerseys seem to lead, with Poland-Chinas closely following. Berkshires and Hampshires will be shown in larger variety than ever before.

The best live stock judges obtainable are being secured to act at this show. In addition some of the best live stock specialists in the West will be present and daily demonstrations in breeding and handling will be conducted. It is the intention of the management of this fair to measure up to the educational standard of modern agricultural and live stock exhibits. There are numerous new breeders in Southern California who are eagerly looking for information in better methods of handling, breeding and agricultural problems and they will be able to secure this information at the Southern California Fair.

A very successful goat show was held at Riverside last year, but the show this fall promises to exceed the one last year by over double the number of entries. The goat building will be more than doubled in size and the best equipment possible will be arranged for the comfort of these prize pets.

Very liberal prizes have been offered by the association this year for county exhibits, and these offers exclude Riverside County as an exhibitor. Communities from other counties may also compete for the very liberal community prizes. The is considered so free and inviting that a number of the counties of the southern part of the state are preparing wonderful exhibits. For this reason the association is very largely increasing its general exhibit quarters. The three judges for the agricultural and horticultural departments will be men with statewide reputation as specialists, and not only will they be able to properly place the awards but they will be at hand during the entire week to give any information in their power.

The race program has received special attention and some very fine events are scheduled

One of the big new features will be the farm bureau demonstration train. This will be both an interesting show and an educational adjunct to the fair. Here will be shown by specialists the proper handling and cooling of milk, the grade milch cow competition, testing milk for butter fat. There will be a miniature dairy and creamery maintained and a visual course in better methods given with special demonstrations. Also the pig club work will be shown and pigs will be shown live and judged, as well as poultry production, feeding and culling with demonstrative exhibit, seed selection and treatment and testing seeds for germination, pruning deciduous fruit trees, rodent control, septic tank construction and many other phases of better agricultural methods.

INTRODUCING

The Conaway Ranch Shorthorn Herd

In establishing the Conaway Ranch Shorthorn herd we were actuated by a desire to lay a foundation upon which could be built a herd of the very highest order, and a herd which it is hoped will play no small part in the up-building of the cattle industry of the West. The choice of breeds was made after a critical investigation in which we were convinced that no other breed held greater possibilities in all directions. The establishment of this herd was a business proposition and nothing more. Future development will keep constantly in mind the fundamental fact that utility is the real essential in breeding. Our aim will be to produce a superior class of cattle. Sound principles will govern all of our business dealings, believing that the foremost principle of success is based on the integrity of the breeder, which at all times must be safeguarded, else the breed will suffer. We expect to attract custom that will result in mutual benefit.

SOME FACTS: In selecting CALIFORNIA MODEL we believe we made our best business deal. Other bulls could have been purchased but we do not believe that any bull combines to a higher degree the qualities found in this bull. Sired by the University of California herd bull, SULTAN MAYFLOWER, admitted by all to be one of the greatest grandsons of WHITEHALL SULTAN, and from the cow, GLENBROOK'S MARVEL, whose record as a producing dam entitles her to rank among the first five living cows of the breed, coupled with an individuality that is suggestive of a true sire, we await the coming of his first calves with confidence. His great grand sire, WHITEHALL SULTAN, was the greatest bull the breed produced in years. SULTAN STAMP, his grand sire, was rated one of the best sons of Whitehall Suntan, and SULTAN MAYFLOWER is said to closely resemble Whitehall Sultan. His dam, GLENBROOK'S MARVEL, is a great-granddaughter of WHITEHALL SULTAN and BAPTON DIAMOND, both from BAPTON PEARL, recently referred to by Alvin H. Sanders as being his ideal Shorthorn female. The dam of CALIFORNIA MODEL produced the grand champion steer of 1916; and a full brother to our bull was grand champion at the Pacific International in 1917, and champion Shorthorn steer at the Chicago International in 1918. Obviously such a record is not a happenstance. Because we know the merit of the blood lines back of him, we have faith that CALIFORNIA MODEL will add much to the breed.

OUR HERD: We are building around CALIFORNIA MODEL a herd of females of equal merit. Only the best are to be given a place. They must be representative of the most acceptable modern type and be backed with proven blood lines. It is not our plan to maintain a large herd, but in addtiion to the herd of straight Scotch females we will maintain a herd consisting of good American families.

OUR PLANS: From such a collection we will be in a position to furnish breeding animals that will appeal to breeders and to those in the market for bulls for range work. As stated, the herd will be handled on a sound, practical business basis. Development will follow natural lines. The health of the herd will at all times receive the utmost consideration. The surplus productions will be offered for sale at prices based on real worth. Everything sold will be guaranteed as represented.

THE RESULT: It is our hope that by establishing the herd on such a foundation, and by conducting the business along the lines indicated that we will succeed in producing a class of cattle that will be appreciated and that the cattle interests will come to regard CONAWAY SHORTHORNS as representing the best obtainable and when in search of breeding material will turn to this herd with a full knowledge that what we may have to offer will be right in every way.

And Berkshires, Too

The Conaway Ranch is also establishing a select herd of **Berkshires**—a fact that should be kept in mind by those interested. The same high standard of quality found in our Shorthorns will be noted in our Berkshire herd.

C. HAROLD HOPKINS

WOODLAND, CALIF.

Do You Know?

Who holds the Pacific Coast sale record for Shorthorns? W. M. Carruthers.

Who owned the grand champion Shorthorn bull at the 1916 and 1918 California State Fair? W. M. Carruthers.

Who bred the highest priced Shorthorn female ever sold on the Coast? W. M. Carruthers.

Who topped the 1918 San Francisco sale on bulls and females? W. M. Carruthers.

Who holds the record for the five highest priced females sold at auction on the Coast? W. M. Carruthers.

Who was the Premier Exhibitor of Berkshires at the P. P. I. E.? W. M. Carruthers.

Who held the highest average Berkshire sale in 1916 and 1917? W. M. Carruthers.

Who bred the grand champion boar and sold the grand champion sow at the 1918 State Fair? W. M. Carruthers.

Who developed and sold the grand champion sow at the 1917 National Swine Show? W. M. Carruthers.

Who bred the only sow to defeat the 1917 grand champion sow? W. M. Carruthers.

Where to buy the best in Shorthorns and Berkshires?

Shire Horses

See Our Exhibit at the State Fair

We cordially invite those interested to visit our stalls and inspect our exhibit of Shire Horses at the State Fair. We have a number of Stallions for sale and we will be pleased to quote attractive prices. Good draft horses are fetching better prices today than ever before. There is a real shortage, and domestic and export demand is developing rapidly.

NOW IS THE TIME TO PREPARE.

Shorthorn Cattle

We have recently established a herd of high class SCOTCH SHORTHORNS representing the choicer families of the breed. From time to time we will have in offer breeding stock of a character that pleases buyers of the better sorts. Our cattle will not be seen at Sacramento this year but a few will be prepared for the later shows. In the meantime we will be glad to have the herd inspected at the ranch.

E. Lovell, Manager

P. O. Address

Diablo, Contra Costa County, Calif.

On a Permanent Basis

By Frank D. Tomson, Editor, Shorthorn in America

Editor's Note: The following article, while written primarily as a plea for stability on the part of Shorthorn breeders, is equally applicable to all other breeds of live stock. The business of live stock raising is based largely upon the element of time and the man who enters the business with patience is the man who wins.

THERE is a tendency in this country, more or less general, and one that developed quite naturally, to change from one activity to another, to place investment in one line for a period of time and then withdraw this investment, or much of it, and place it in some other line. This applies to nearly all lines of business activity, farming, live stock breeding, merchandising, banking, there is a long list. Following this fluctuating inclination inevitably results in sacrifice of a considerable part of the advantage which has been acquired. There is built up a good will that has its value, and in many business concerns this good will has actually a greater value, is in fact a more important asset, than all of the material investments of these concerns.

This is a matter, and a most important one, that is frequently overlooked entirely, or, if recognized, underestimated. There are many businesses that could lose all of their material assets, yet retain their good will and continue almost uninterrupted along a successful course. This may seem a radical assertion, but its truth has been demonstrated times without number. Professional men, lawyers, doctors and others, spend long years in becoming established, in acquiring good will, knowing that once this has become their possession, their success is assured.

In no other industry does good will have a greater value in relation to the business than in the pure bred live stock industry. If you are inclined on the spur of the moment to question this, think back over the names of far-sighted men who became well established and who created and possessed the good will that became a priceless asset in their business. Then, if you will, recall the names of those, and we can name them by the scores, who having obtained the advantage of good will and established reputation, tossed it aside and disposed of their herds. They sacrificed what it had taken many years to obtain and received in the final act of closing out a meager return therefor. This good will isn't an asset that can be readily turned to another. Its greatest value is in the continuity of the business of which it is a part.

It seems an unfortunate condition that so large a number of those who have engaged in the breeding of pure bred live stock, and this applies quite as forcibly to the Shorthorn as to other breeds, have failed to hold their position of advantage for the simple reason that they did not place the proper estimate upon the value of good will. The building up of a herd of registered Shorthorns cannot be accomplished in a day. The profits to be derived come in larger proportion after the herd is well established than at the outset. I do not mean to suggest that there are not safeguards for the beginner, for this has been widely demonstrated, and these safeguards are increasing as a result of the practice of Shorthorn breeders generally and the policies adopted by the American Shorthorn Breeders' Association, but I desire to emphasize the increasing advantages the longer one is actively and discreetly engaged in the business. Let us assume, for instance, that Amos Cruickshank could have lived and retained his herd intact to the present day. Is there anyone who would question the tremendous advantage he would have in patronage as the result of the good will which his operations warranted and obtained? Another example is the case of the late Colonel Harris' Linwood herd in Kansas. A turn in his affairs caused him to decide on short notice to disperse his herd. The months that had preceded this decision had not been especially prosperous, a condition that applied to all industries as well as agriculture. But it was evident just at that time that business was reviving. Yet the Linwood herd passed from his ownership when he was admittedly one of the most constructive breeders of his time, and the material which he had in hand was scattered to the four winds. Could this herd have remained in Colonel Harris' possession and continued under his direction, the measure of the financial success that in all probability would have followed can scarcely be estimated. So we might go on and enumerate, one after another, breeders who for one reason or another turned away from their established course and allowed their greatest possession to vanish, scarcely appreciating in ever so slight a degree the worth of this possession.

In what other line of business does this good will have so close relation to success and so large a proportionate value? I can conceive of no other line outside of the professions in which it plays so important a part.

At the outset I suggested that this fluctuating tendency was quite natural, and the reason is this: we have looked upon ourselves as a young nation, a new people in an undeveloped country, with boundless resources available almost without effort and without cost. A farmer acquired his land in Ohio, tilled it until it had increased in value beyond his hopes. Then he sold it and went farther west into Illinois and acquired a larger tract of land and began the development of new property. Again he saw his land increase in value to an extent that seemed to him beyond reason and he sold out and journeyed on farther west into Iowa where he was able to buy more extensively. Again he began the process of making and improving a farm, but the price moved always upward and he heard of cheaper land in Kansas, in Texas, in Nebraska, in the Dakotas and farther on So he converted his Iowa farm into cash and moved into some section where land was still available at a low price. This is just a sample of the condition that induced men to change their locations and in changing their locations there were offered alluring prospects in other channels, in merchandizing, banking, mining and numerous others. So it happened that many men, before they had reached middle life, had operated in numerous locations and invested in several lines. Some of them had prospered, but many others had failed to hold their capital intact.

But these alluring prospects have largely faded away. The cheap land all but a limited acreage, has been brought under cultivation and private ownership. The money that is now taken from a farm investment in Illinois buys but little more, if any, in any other section of the country. Conditions have become more stable. From now on success will be won with less fluctuation, with less changing of base, with a more continued effort directed in one place and along one line. The breeding of pure bred Shorthorns is taking on a stabilized condition. True, there are those who make investments on short notice and quick turns when the conditions are most favorable and realize a satisfactory profit, but even in such cases the profit realized is probably much less than if the investor had continued in possession of the cattle acquired and taken advantage of whatever prestige may have attached to them.

In the main, however, we are not speculators. Our farms are operated and improved to obtain better results if our activities are continuous. There are years when the profits will be larger than others so far as the cash income is concerned, but to the constructive breeder it often happens that what are regarded as the lean years are the ones in which they realize the largest profits. That is, they are able to make selections of breeding stock of the desired pedigrees and standards that enable them to work the hoped for improvement in their herds, and when the periods of greater prosperity come, and they invariably do come, the established breeder is in position to reap the larger cash profits which accompany these periods. These months and years of preparation are of vital relation to success.

Suggestions for Feeding Cows on Seven Day Tests

By J. E. Burnett, Dairy Husbandry Section, Michigan Agricultural College

IT should be remembered by the feeder that it is the natural tendency of the cow to give the heaviest flow of milk soon after freshening and he should do everything possible to stimulate this tendency with cows that are on official test. In the short time test we look for the largest production that the cow is capable of for a limited period, not the largest normal year around production, and the short time records should always be considered in this light. It should be the effort of the feeder to cause the cow to give him all she can during the test period.

It is not natural for a cow to come into her milk immediately after calving, and the seven-day record in which the largest flow of milk occurs, consequently, usually starts more than seven days after calving. The higher percentage of fat is usually found immediately after freshening, and the increase here usually more than makes up for the greater flow of milk that comes at a later period. The largest production occurs, however, when the feeder is skillful enough to hold the high test of the cow until the large flow occurs, when the two combine in a way that brings joy to the heart of all concerned.

More large records are made before the cow freshens than are made afterward. By this statement I mean that the feeder can do more toward helping his cow to make a large record by getting her in good condition before freshening than he can afterward. The cow on the seven-day test cannot eat enough, as a rule, to supply her with the necessary nutrients from which to manufacture the milk, consequently in order to get the nutrients she must take them from her body. In order that she may be able to do this they must be there in a form that is readily available. Therefore the cow should not only be in good condition at freshening time but should be fat and the fat should be soft enough to be consumed readily to furnish the energy necessary to make the milk. In order to have the fat soft it must be put on quickly within two or, at the most, three months of the time of freshening. Fat put on slowly comes off slowly.

A good ration to feed for fitting is bran, oats, corn or barley and oilmeal in equal parts by weight. If you can obtain hominy it is an excellent feed for this period and should be substituted for the corn, as the fat formed by this feed is softer and therefore more desirable.

About ten days before the cow is to freshen, change the feed to ground oats and bran or bran alone. If the bran and oats are used they should be in equal parts by weight. This change will put the cow in a laxative condition, will help to keep the fever out of her blood, and will help to reduce or prevent the congestion in her udder. In an hour or so after freshening give her a pail of warm water. Give only warm water for twelve hours after freshening. For feed, continue the bran and oats or the bran alone as the case may be, for two days when she may be gradually put on the regular test ration. Leave the calf with her for twenty-four hours. It will help to reduce the congestion in her udder and the calf should have the first milk. Do not milk her out completely for two days as a preventive against milk fever. Start in milking three times a day on the third day and four times a day on the fifth or sixth day or before, if necessary.

At the time of the starting of the test the cow should be getting grain at the rate of one pound to each four and a half pounds of milk produced. This may be slowly increased until the cow is taking all that she will with safety. How much, depends to a large extent upon the individual cow. Some cows will go off feed on one pound of grain to three and a half pounds of milk while other cows will take a much larger amount of grain. The amount to be fed is a question to be settled by the feeder himself and must be changed to suit the needs of each cow.

It is usually advisable not to make sudden changes in the feeding as cows are usually very sensitive to such changes. It is safest not to increase the grain more than a half pound per day. Care should be taken that the cow is not overfed. It is a good plan to always feed a cow a little less than she is evidently willing to take. The first sign that the cow is going off feed is that the coat is rough in spite of good grooming. Next the eyes appear glassy and staring and finally the cow refuses to eat all or part of her feed. The best way to treat this is to cut down the grain ration at once to half or to omit a feeding entirely, and if the condition continues, to give a dose of Epsom salts or call a veterinarian. A pound to a pound and a half of salts, depending on the size of the cow, is a good sized dose. The best way to give salts is to use a quart milk bottle as the wide mouth allows the air to enter readily and shortens the time necessary. Give the salts in plenty of water, at least a gallon of water to the pound. This gives better results than where only a small amount of water is used.

All the grain should be weighed to the tenth of a pound. All roots and silage should be either weighed or measured. This is very important because while it may be possible to feed a cow successfully without weighing or measuring her grain very few men are experienced enough in handling grain to accomplish this.

What the ration should consist of depends largely upon the feed at hand, the individual taste of the cow, and the length of time that it is expected to continue the test. It may be said, however, that it is the general plan to feed a rather narrow ration, one that contains a rather large proportion of protein. It is expected that the cow will balance the ration from her own body.

It is more important that the ration contains feeds that the cow likes than that the nutritive ratio be at any set figures. The digestible nutrients found in the feeding tables are only approximations of the nutrients contained in the feeds in question as they are the results of averages and the feeds on hand may be higher or lower than the figures given.

It is well to make a variation in the feed of a cow on test, that is, to change the ration. This should be done gradually as cows are very susceptible to sudden changes. All changes in the feed ration should be accomplished by replacing a small portion of the old mixture with an equal portion of the new. Cows do better when there is a large number of different feeds in the ration. They do not tire of it so quickly and will eat more of the mixture because of the variation. Give the cow all the water she will drink. The more she consumes, the better. If it is impractical to keep water before her all the time, she should at least be watered at every feeding.

It is a good plan to have plenty of beets or other roots on hand when starting the test. Red table beets are best if they are to be had. Cows will frequently eat a hundred pounds or more per day of these beets. If the red beets are not to be had, then mangels, sugar beets, carrots, rutabagas or turnips should be substituted. Cows that are not fed too heavily will eat rutabagas readily but under test conditions where it is desired to get all the feed into the cow she can handle, they soon tire of the rutabagas and refuse to eat but a very limited amount. Roots of any kind are usually found to be great stimulators to the flow of milk. They are fed for the laxative effect and the succulent value rather than for the food value that they may contain.

The best way to feed a cow for the seven-day test is the way that gets the best results and this will probably be a little different for each cow. The exact methods that will get the best

SHORTHORNS OF QUALITY

No Western herd has been assembled with greater care or with more regard to the breeding, individuality, character, breed type or real beef qualities. Time or money were not factors in the founding of the herd. The best herds in America were drawn upon as well as a few of the highest esteemed herds of England and Scotland. On account of a recent move the herd will not be represented at the State Fair, but a cordial invitation is extended to all to visit the farm and inspect the young stuff, both bulls and females, that we have to offer.

Herd Bulls

DIAMOND CHOICE, a roan son of the famous DIAMOND GOODS and from a QUEEN OF BEAUTY dam. A massive, thick fleshed smooth bull—right individually and a sire of note.

GREENDALE SULTAN, a white son of LESPEDEZA SULTAN, one of the greatest sons of Sultan Stamp, and out of a Victoria dam. Regarded by all as one of the real top bulls owned in the West. His calves are outstanding in any company.

The Breeding Herd

The breeding herd contains many of the most attractive matrons owned in the West. The majority of the females are high class representatives of the most popular Scotch families. Several are imported. Among them are a number of prominent prize winners at important American and British shows. The best evidence of their real worth is the class of calves they are dropping to the service of the above bulls.

If in the market for a young bull of herd heading qualities or for bulls to use in improving the quality of your range cattle, you will be interested in visiting this herd before making final selections.

T. T. Miller Hollister, Calif.

THE MARK OF QUALITY

HILLCREST STOCK FARM

a Pioneer Breeding Establishment

Hillcrest Shorthorns

For years this herd has been looked upon as one of the reliable sources for high class breeding stock. A history of our winnings at the leading Western fairs, would be a history of those fairs. Many of the greatest bulls to see service in the West have been important factors in the building of this herd. Today the herd is stronger than ever before. The needs of the breeder, or the range operator, can be taken care of to advantage.

Hillcrest Shropshires and Merinos

The part played by the Hillcrest Shorthorns has been duplicated by the flocks of Merinos and Shropshires. Wherever sheep are run in the West, the name of Glide is known.

Visitors are always welcome.

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy
Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

Price, $1.75 per bottle at all Druggists or sent by us express prepaid. Write for Free Booklet and read what others say.

results with one cow will not with another. It is necessary to study each individual cow to learn her likes and dislikes and then try to follow them as closely as possible. Some cows do better for having a little exercise out doors each day while others do better in the barn all the time. Some cows do better if milked with the milking machine but most do better if milked by hand.

Doubtless there are many breeders that have had experiences that led them to take different views than the above, but these are the general rules that the majority of cows will follow, although as I have mentioned above. each cow is a study by herself.

Fake Tests Exposed

TO THE Members of the Holstein-Friesian Association: I had hoped to be able to wait until action had been taken by the executive committee or board of directors of the Holstein-Friesian Association before advising you on the status of the complaint against Charles Cole in testing animals for Advanced Registry.

This matter came to the attention of the writer at Brattleboro, Vermont, through a conversation with the man who has charge of testing for Advanced Registry in that state. This gentleman advised me that they had received information from a source that was reliable, that Charles Cole had attempted to make a fraudulent record on a cow that he owned and was then under test in Vermont, through the injection of cream into the milk, and that acting upon that information the state of Vermont had employed assistance and had sent three men to aid in having a re-test made. The description conveyed to the Vermont station described Cole as wearing a smock and overalls with a rubber bottle containing cream underneath the smock and a rubber tube extending from that down under his overalls, the tube being long enough to reach the pail when he was sitting over it milking. When visiting the farm Cole came to milk this cow under re-test with smock and overalls, and when he started to milk one of the supervisors suggested that he remove the smock. Cole declined to do that, insisting that it was not necessary. They watched him closely and when testing the milk it tested two per cent less and was considerably less in pounds that had been the previous milkings. Cole declined then, for reasons he advanced, to make any further attempt with the cow, said that the test was off, and refused to continue with the re-test.

The writer then suggested that the gentlemen come with him to the board of directors who were then in session at Brattleboro and he told the same story to them. At his suggestion the dean of the agricultural college was asked to come and meet with the directors He was advised by the writer, with the sanction of the board of directors, to go on and make his investigation and the Holstein-Friesian Association would pay the expense of it, that it looked as though with the information they already had that they would be better able to get additional information than any one else, that might, perchance, lead to further developments. It was agreed that the state would go on, employ whatever assistance was necessary, make a full and complete examination, and report to the superintendent of the Advanced Registry and the secretary of the Holstein-Friesian Association at the earliest possible moment, that the board of directors or executive committee might take further action.

It was felt then that publicity or notice might interfere with getting any further information. There evidently were rumors afloat in connection with it, and before either secretary or superintendent of Advanced Registry could get a report from the further investigations of the Vermont station, I received a telegram from the chairman of the executive committee that he had received a letter of great importance, asking if it would be possible for me to meet to him in Cleveland. I went to Cleveland on Monday, July 28, when Mr. Reynolds, chairman of the executive committee showed me a letter from Mr. J. Williams of Sterling, Illinois, to the effect that he had information that was certain, of the most startling character, and went on at great length without giving names or any specific information. We concluded to have him come to Cleveland and telegraphed him. He came to Cleveland the next day and advised the chairman of the executive committee, and the writer, that upon hearing the rumors about the condition in Vermont and still having full faith in Charles Cole with whom he had made a contract to test for him, he telegraphed Mr. Cole to meet him in Buffalo and he met Mr. Cole in Buffalo. Mr. Cole had with him his brother-in-law, Mr. Crawford.

During the conversation Cole admitted to him that he had been making some large fraudulent records and when Williams showed his astonishment Cole went to considerable length into the different animals that had made these records. Now the chairman of your executive committe and the writer had the rumors and partial reports from the Vermont station, had a report from Mr. Williams that he had talked with Mr. Cole when there were present only Mr. Cole, Mr. Williams, and Cole's brother-in-law, Mr. Crawford, and it was then deemed advisable to call a meeting, by telegraph, of the executive committee, for the 4th and 5th of August at Chicago, and at the same time the chairman of the executive committee should go with Mr. Williams and interview Mr. Cole, find out just what he was willing to tell and what he had to say in relation to the tests that he had been making, and any other information that he might have that affected the records of the association. Mr. Reynolds with Mr. Williams went and saw Mr. Cole who they reported was perfectly willing to tell all he knew about it, and just what he had done. Mr. Cole agreed to come to the meeting of the executive committee in Chicago on the 4th and 5th, and did come there. There, in the presence of the entire committee and a stenographer, he went on and told his story of the testing that he had done where he had started in the state of New York some years ago, went into his personal history, described many of the animals that he had tested at the Cabana Farm, explained fully how he had helped the cows, as he had described it, by putting cream in the milk. He told who was familiar with what he was doing, to whom he had imparted the knowledge of the way that the high records were made, and who he had helping him. He expressly stated, however, that Mr. Cabana had no knowledge whatever of what was going on. He described the large bonuses he received for making the records running into the thousands of dollars, of which he received two-thirds and Mr. Nieman, in charge for Mr. Cabana, received one-third. In one particular case the bonus was $3000 for a single record, in which case he had $2000 and Mr. Nieman $1000.

This statement, which took a large portion of a day, was reduced to writing, signed, and sworn to, and the committee at that time decided that these persons whose names had been mentioned in connection with this, who owned cows whose records Cole claimed were fraudulently made, should be notified before the board took any action, and they were telegraphed and requested to meet at Cleveland, to which place the committee adjourned to meet on the 6th.

At the adjourned meeting in Cleveland Mr. Cabana came before the executive committee, told them how surprised and grieved he was that such a thing should have taken place, and that it was absolutely without his knowledge except as to the bonuses. He stated that he had paid these bonuses because others had offered Cole the same amount, and that he felt with the large herd he had he was in position to pay as much as anybody for making records.

Mr. Nieman came before the committee, denied all knowledge of the fraudulent record episode, but did admit that he had been receiving one-

third of the bonus as described by Cole.

Mr. Brooks, who had been associated with Mr. Cole in the making of records and whom Mr. Cole claimed he had advised of the manner in which they were made, and the scheme by which they helped the cow produce the results, and who lived at Cole's house, claimed that the records he made were all right, that he never knew anything about Cole making fraudulent records, that so far as he knew the records were straight.

Mr. Bernhard Meyer of Finderne, New Jersey, appeared before the committee, chagrined and humiliated because of what Cole stated had taken place, while testing certain cows recently for him, but he had no knowledge of the facts, and the only thing that he knew about the way the cow had been tested was what Cole said about it.

Several of the persons notified did not appear, and as the time was short it was thought before acting the executive committee should give them further opportunity, and in the meantime get what further testimony was obtainable. The committee adjourned to meet on the 25th, at which time final action will probably be taken by the executive committee.

The committee realizes, and the breeders will readily appreciate, the tremendous scope and influence that the action of the executive committee or board of directors is bound to have not alone on the animals whose records may be expunged, but the offspring that have been sold in practically all the states. Thousands and thousands of dollars have been paid for the offspring because of the record of the dam, and calves of the offspring have been sold at large prices because of the record of the grandam, and the effect is already apparent in two or more generations.

The executive committee also realizes that the Holstein-Friesian Association of America is a Record Association, that one of its records is that of advanced registry; that the maintenance of the accuracy of these records is the reason for its life, and that while the expunging of frauds from our records may bring disgrace, anxiety, and loss to some of our breeders the necessity for quick and accurate action on the part of the executive committee or board of directors is conceded by all. The only question in the mind of any officer or member of the board of directors is what is the right in the premises, what does justice, equity, and good conscience demand, and that action will be taken.

There can be no possible question about the necessity of expunging records known to be fraudulent. The injury and wrong would only be continued to permit them to remain, and there will be no hesitancy whatever on the part of the board of directors to take action when in possession of all the facts.

We ofttimes hear people say what they would do. Some of us are overly willing to advance opinion when no responsibility is charged against us, but this is a momentous proposition for the Holstein-Friesian Association. The Herd Books of this great industry have been assaulted, and an insult and injury inflicted upon every breeder of the black and white wherever located, because in my opinion the man who has debauched our records has assaulted the good name and fame of the greatest breed of animals on the earth. There was no occasion for exaggerated. There was no occasion for fraud. The Holstein-Friesian cow has demonstrated herself on every occasion to be the most wonderful producer of milk and dairy products in existence, and this under legitimate and regular conditions.

I feel called upon to make this statement to the breeders at this time before action has been taken by the board of directors, because of publication occurring in papers in Boston and elsewhere, and it seemed to me that no additional harm could possibly come by giving the membership generally a history of the case, although my judgment had been that no report should be made until action was taken by the executive committee or board of directors and the particular animals affected specified, because the great bulk of animals tested by Cole are not questioned. It was only possible to perpetrate the fraud on one while testing six for advanced registry, and when certain supervisors were in charge at the Cabana Farm he made no attempt whatever to perpetrate the fraud. Consequently only a small number of the records made can be charged with fraud, and to have this information come out before full information could be given as to the animals that would be affected, seemed like causing a lot of anxiety among thousands of persons who had bought animals not knowing whether theirs were among the fraudulent ones.—D. D. Aitken, President, Holstein-Friesian Association of America.

TO MAKE GLENN COUNTY A DUROC CENTER

It is difficult to think of Duroc-Jersey Swine without thinking of the Uneeda Glenn County herd.

For a numer of years H. P. Slocum & Son have been breeding Duroc-Jerseys, the herd being under the active management of Clayton Slocum. Mr. Slocum states that it has been a hard, uphill fight, but by exhibiting at the leading fairs in this and other states, constant advertising and innumerable personal calls he has been able to thoroughly establish his herd and is just beginning to reap, to a certain extent at least, the reward of his efforts. Mr. Slocum recently remarked to a Cultivator representative, "There is scarcely a week that we do not make one or more shipments, aside from those we deliver here on the ranch. For instance, last week ke shipped to Mr. McCabe, Lompoc, a boar; to L. A. Lesh, Tulare, a boar; 10 gilts to F. R. Seccombe, Los Angeles; a boar to J. S. Gibson, Williams; a boar to Brownell & Marshall, Woodland; a boar to E. E. Brownell, Suisun, and a boar and three gilts to A. C. Holly, Dixon.

"If the present demand keeps up we will soon be entirely sold out with the exception of spring pigs, and we are not overly anxious to sell these at the present time." Mr. Slocum also states that he is planning an extensive trip through the East, where he will purchase a number of top sows for his own herd and in addition will select 50 or 60 for the farmers of Glenn County. Late this fall a meeting of a large number of farmers in Glenn County will be held at which time the Glenn County Duroc-Breeders' Association will be organized. Next year you can look for a number of public sales of Duroc-Jerseys in Glenn County.

WELL KNOWN KINGS COUNTY BREEDERS' SALE

On October 7 in Hanford, M. Bassett, J. H. Crawshaw and Fred Ross will sell 75 Poland-China bred sows and a few boars of sufficient merit to take their place at the head of some good herd. Mr. Bassett, one of the oldest breeders and considered the father of the breed in this state, will sell 40 sows by Model Chief and Model Fellow bred to such boars as Kings' Timm, Kings' Gerstdale Jones, Model Fellow Jr. and Model Dreadnaught. Mr. Bassett considers Model Dreadnaught a great boar and is expecting him to prove an exceedingly valuable sire. J. A. Crawshaw will sell 20 gilts by California Gerstdale and bred to Kings County Buster and Some Price, a son of Great Price, a half brother of Black Price, the 1918 grand champion at the National Swine Show. Fred Ross will sell 15 gilts by Rossmead Big Bob, a boar that was considered by many the best Poland-China boar in California. The Ross consignment will be bred to his new boar, Big Timm, recently secured from Robinson Bros., Morton, Illinois.

There is hardly a doubt that this sale will be one of the most successful Poland-China sales held this year.

California as a Field for Duroc-Jerseys

By V. F. Dolcini

WHEN one stops to realize that ten years ago there were but a couple of Duroc breeders in the state and that at the present time there are far over one hundred, one can imagine what tremendous strides the Durocs have made; and yet this is only the beginning. The most rapid strides have been made recently and the breed is going ahead faster today than ever.

California is considered by all live stock men to be the greatest state in the union for the growing of stock, and especially hogs. With 12 months of growing weather and with green feed practically every month of the year there is no reason to doubt California's future as a hog producing state. In the past California has not raised enough hogs to supply her own demands and at the present time there is a great shortage of hogs in the state. This simply means that we must raise more hogs than we have in the past.

It is a generally acknowledged fact that the Durocs outstanding strong points are their prolificacy and their ability to graze and rustle a large part of their own living. Since we have so much alfalfa for hogs to graze on and since there is so much stubble to graze on in the fall of the year, the Durocs, by reason of their extremely good grazing qualities, are particularly adapted to these conditions. From experimental data we find that hogs running on alfalfa make gains on one-third less grain than those fed in a dry lot, which means that we must have hogs that will get out and eat their share of alfalfa along with a grain allowance, and this we find Durocs are especially willing to do. When we come to real rustling, which means getting all of their feed from a stubble field and alfalfa pasture combined, it will be found that the Durocs are out eating and making gains when a great many other hogs are lying in some comfortable place asleep.

Aside from their rustling qualities, which is a big item, if there is one outstanding point which the Durocs have, it is to farrow big litters and raise them. Durocs are especially prolific as a breed, and it is because of this fact that they are so popular here in California. By big litters we do not mean an average of 12 or 15 pigs, but you will find most Durocs will raise eight good pigs twice a year.

These two points are simply mentioned as outstanding advantages of the Duroc, not that they are at all lacking in any of the good qualities which other breeds possess. If put into a feed lot they will make gains as economically and as rapidly as any other hog and will finish into a marketable hog excelled by none. The fact that four out of every seven hogs that went to the leading markets were Duroc or Duroc grades, and that some of the biggest butchers and packers in California have their ranches stocked with Durocs is proof enough of what they think of them as killers; and, on the other hand, if they were not making more money for them than other hogs they would not have them.

Durocs have come into California with a good many years handicap by other breeds and yet they have forged ahead and today are as popular a breed as we have. They have gone ahead here, as they have in all other places, because of their merit, and that alone. They are not a breed that has been boomed and pushed by moneyed men of influence, but because they suited the conditions and made more money for their owners.

Heretofore the Duroc has been considered from the farmers' and butchers standpoint, but the future of the pure bred looks even better. If there is one class of live stock that should be pure bred it is hogs, and we find men who bought pure bred boars to use on grade sows a few years ago are today getting rid of their grade sows and putting in pure breds. With pork up to and over 20 cents per pound they find it does not pay to use grades when it costs so little to get started with pure breds.

Then, too, with the extension work of the government and university aiding and encouraging boys' pig clubs there is a great demand for pure breds, and what is more, most of these boys want Durocs. One of the men in charge of this work said that more boys wanted Durocs than anything else. If they get them, they will boost the breed considerably. When you realize that the majority of these future hog raisers want Durocs you can readily see what the future of the Duroc is. It is unfortunate that all of these boys could not have been supplied, but California was simply short on Durocs during the past year. There was far greater demand for bred sows than the supply could fill. So it is evident that California must increase the stock of Durocs. If the Duroc breeders of California will get together and agree to sell only good hogs, and supply these boys' pig clubs when they want pigs, at a fair price, there will be such a demand for good Durocs in the future that it will keep all of the breeders busy raising enough good ones to fill the demand.

Up to the present time whenever a man wanted good Durocs he had an idea that he had to go East to get them. That was all very well in the past, but if we are to continue breeding Durocs it will be remarkable if we can't raise as good ones here as we can buy in the East. We can grow them as well, and all that is necessary is to get some good foundation stock and use a little judgment.

Another bright prospect for the fufuture is our outside markets for pure breds. By these, I refer to the Philippine and Hawaiian Islands, South America, and China and Japan. They are going to draw on us, as this is the logical place to get them, and we must have hogs that are good enough here in California to ship to these countries. We have already shipped a number to the Island and some to South America, and in the very near future some will be going to Japan. It is simply up to us here in California to raise the right kind of Durocs and raise them well, and we will always have a market for them. If all breeders would go into the business with the idea of boosting Durocs by only selling the good ones and by giving every man and every breed credit for what they have, California would soon be right up to the top as a Duroc state.

With the Durocs' present popularity here, as indicated by their number and distribution, with the price of pork as it is, and with the growing demand for good Durocs, no one can argue but that California is a good field for Durocs.

WINSOR RANCH GETS MORE EASTERN DUROCS

In a recent letter from R. K. Walker of the Winsor Ranch he writes as follows:

"I have just returned from my second trip east in the last six weeks. On the first trip I bought five outstanding sows, bred to, or sired by, Great Sensation, Great Orion Sensation, Pathfinder, Great Pathfinder and Top Sensation. These are real sows and cost me as high as $800 for some of them, not including express. On this second trip I bought 80 head of spring and fall gilts sired by the world's best boars, among them being gilts by Great Sensation; Great Orion Sensation; and Orion's Sensation, his litter mate; Great Wonder I Am, the largest boar in the world; Pathfinder; Grand Model's Type; King of Orions; Grand Model; Orion Fancy King and others. These gilts are mostly open and will be bred to our boar Great Model, and our two new herd boars, Winsor's Giant Orion and Great Sensation 3rd.

"Winsor's Giant Orion is all his name implies. He is the largest Duroc-Jersey boar on the Pacific coast and withal is as smooth as a pig and extremely mellow. He measures 82 inches from between eyes to the root of his tail, stands 40 inches high and weighs 965 pounds. After seeing the pigs he sired, Fred De Voro tried to buy him for Ed Kern's herd, but we already had an option on him. Every

one likes this boar. He has extreme size and shows remarkable depth, finish and easy feeding qualities. Has as good an eye as I ever saw on a hog, and, best of all, sires pigs like himself.

"Great Sensation 3rd is a son of Great Sensation, and the world's highest priced sow at public auction, Uneeda Lady. She is a Sensation-bred sow and the best sow I saw in the East. Ed Kern paid $8000 for five of her spring boar pigs and sold two of them again in a week for $8500. Great Sensation 3rd is out of her last September litter. He is the largest fall boar I ever saw. He stands 36 inches high, 65 inches from between eyes to root of tail and has full nine inch bone. Eastern breeders all admit he is one of the largest boned fall boars in the world.

MARSH-McCRACKEN POLAND-CHINA SALE

The announcement of the sale of Poland-Chinas to be held by Marsh and McCracken will, no doubt, create considerable interest, due to the prominence these two breeders hold in the Poland-China field. Hale I. Marsh of Modesto has for a number of years been one of the leading Poland-China breeders on the Coast. He has been a large exhibitor and a consistent winner at the leading fairs and live stock shows. Les McCracken of Ripon firmly established himself as a breeder of Poland-Chinas by the purchase last winter of the boar Kings' Big Bone Leader at the long price of $700. Probably no Poland-China boar on the Coast has a better standing as a sire or is more often referred to than Kings' Big Bone Leader.

On October 4, 50 head of bred sows and gilts selected from these two herds will be sold at public sale in Modesto. The offering will be made up of such blood lines, already popular and desirable, as Model Major, Kings' Big Bone Leader, Major Hadley Wonder, I. B. A. Wonder, Blue Valley Tecumseh, Lodi Giant and Joe's King. To those familiar with the most popular Poland-China blood lines, these names are significant of the kind of animals to be sold in this sale.

COMBINATION POLAND SALE AT HANFORD

On October 7 in the Bassett, Ross, Crawshaw sale there will be offered by Mr. Crawshaw, 20 gilts sired by California Gerstdale, out of large prolific dams representing such blood lines as Longfellow Special, Jumbo Equal, Long Wonder and President's Equal. These gilts have been carefully grown out, bred to Kings County Buster and Some Price, to farrow at 14 to 16 months of age.

STRINGY MILK

"Stringy milk can be prevented when old utensils, especially the strainer cloth, are boiled," says C. H. Eckles, chief of the dairy division of the University Farm. "If a tank of cold water is used for cooling," he adds, "it should be emptied and scrubbed with boiling water. If this treatment does not eliminate the trouble the fresh milk should be heated on the stove to a temperature of 150 degrees, then left standing 20 minutes at this temperature and cooled as quickly as possible."

Stringy milk is not caused by the feed or any abnormal condition of the cow, but by bacteria which enter the milk after it has been drawn from the cow. Milk affected in this way is not unhealthful but it is certainly not appetizing.

ROADHOUSE AT FAIR

Assurance is given of a successful exhibit of dairy products by the fact that Prof. C. L. Roadhouse will have charge of the dairy exhibits at the state fair. The association is offering medals and cash prizes amounting to $1000 for exhibits of creamery butter, cheese, market milk and cream. Three cash prizes on judging dairy products, amounting to $150, are offered. The money in this class applies on scholarships in the dairy manufacturers' short course at the University Farm, to be paid to the winner upon completion of the course.

HOG WALLOW A COMFORT FOR PORKERS

It is as natural for the hog to want to wallow as it is for the small boy to scurry to the old swimming hole with the first breath of spring. Hot weather is hard on fat animals, the portly porker included. That is why a well made, sanitary hog wallow is like a Coney Island bathing beach for the hogs. A popular and serviceable type advocated by the United States department of agriculture should be made of concrete about 12 inches in depth and large enough to accommodate the herd. The wallow should be supplied with a satisfactory intake and outlet so that it can be filled about two-thirds full of water and drained every few days or as often as is necessary to keep the pool fresh and cleanly.

Where natural shade and shelter are not available, the hog owner should put up a temporary shelter by building a framework about four feet high and thoroughly covering the top with brush, straw, grass, or hay. This inexpensive sunshade should be of sufficient size to protect a herd of hogs in comfort as they lie under it. As a rule the ordinary hog house should not be used for shade purposes during the summer. Each year hog mortality is comparatively heavy due to "porker sunstroke" induced by maintaining the hogs in the open without sufficient protection from Old Sol's furnace.

Geo. V. Beckman & Sons, Lodi, owners of the Lake Side herd of Poland-Chinas, have recently purchased from L. R. Glover of Missouri a March yearling gilt sired by Big Bob's Equal and bred to the noted Liberty Bond. The Beckmans are very enthusiastic over their purchase.

The New 16 Valve
Twin City Tractor
Pays Big Dividends

For the first time in the history of the tractor industry, the 4 cylinder, 16 valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16 valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

Why You Should Choose the Jersey

By Guy H. Miller

THIS article is particularly addressed to the man who is under the impression that Jersey breeders breed Jersey cattle just because they consider them the handsomest of cows and are in the business from the fancier's point of view. To all such I desire to present the following eminently practical reasons for selecting this well known breed:

The milk of the Jersey is superior in quality to that of any other cow. Why is it that you see the word "Jersey" on so many milk delivery wagons? And why is it that you so rarely see the name of any other breed of cattle on a milk wagon? The reason is that experienced dairymen and a large number of the consumers know that the Jersey cow gives the richest milk of any known cattle. Wherever real Jersey milk has been tried by the housewife it is without exception preferred to any other. There are many retail dairies that have the word "Jersey" on their wagons that have never sold any Jersey milk nor any that approached it. There are many retail dairies whose milk contains a small quantity of Jersey milk mixed with a large quantity of the poorer article for the purpose of raising their product to the standard required by municipal law. Such dairies using the word "Jersey" are using a substitute for the genuine article. They sell "watered stock" for the real thing. One of the surest signs of excellent quality in a product is that salesmen endeavor to use the name of this product to assist in working off on the public a product of poorer quality that has no reputation of its own.

The cream from Jersey cows needs no artificial coloring added to it in the churn.

The Jersey cow's milk is easier to churn than the milk of other breeds, for the reason that the globules of fat that rise to the surface to form the cream are larger in the milk of the Jersey cow than in milk of a poorer quality. For the same reason also her milk is easier to skim and skims more thoroughly, leaving a smaller amount of fat lost in the skim milk.

The skim milk from Jersey cows is more valuable for the reason that it contains a greater per cent of solids, besides the fat, than the milk of other cows. The average per cent of fat contained in the milk of 10,800 Jersey cows that have been officially tested for the period of a year is 5.37 per cent fat. This is considerably in excess in fat content of that produced by any other breed of cattle.

The United States bureau of animal industry's Bulletin No. 155 states that Jersey milk contains 14 per cent total solids. This is the highest amount of total solids produced by any dairy cattle. For this reason Jersey milk is the most valuable for cheese making. Owing to its high per cent of total solids more cheese can be made from 100 pounds of Jersey milk than from any other. More casein can be made from it, more dried or condensed milk.

The Jersey is the most economical producer of butter fat and of milk solids. She gives the greatest return for the amount of feed consumed. She has been entered in extensive competitive tests with other dairy breeds under supervision of well known dairy authorities and has unqualifiedly demonstrated her ability to produce dairy products at the least cost per pound. This fact should be carefully considered by every dairyman, particularly by the man just starting in the dairy business. At this time every known feed for dairy cows, unless it be wild grass pasture, is at a very high price. It is the amount of money left after the feed bills are paid that really adds to the bank account. The dairyman should never overlook this fact.

The Jersey cow comes into profit at an earlier age than the cows of larger breeds. A Jersey heifer at 24 months of age is as near maturity as the heifers of larger breeds at 30 months of age, thus saving an expense of six months in feed in raising the Jersey cow.

No cow is longer lived or a more regular breeder than the Jersey. Many Jersey cows have bred up to 18 and 20 years of age. Pogis Irene 2nd dropped a calf and started on a yearly test in which she made 590 pounds of butter fat beginning when but a few days under 19 years old.

The Jersey as a breed is most prepotent. Daughters of well bred Jersey bulls from all other kinds of cows give milk of higher quality than their dams and are more economical producers. This is because the Jersey has been bred for 200 years as an economical dairy producer.

That she is the handsomest of all bovine animals is universally admitted. She embodies beauty and utility in the highest degree.

In selecting a breed of dairy cattle, why not select the Jersey? By so doing you will secure the result of 200 years of time given by thoughtful breeders in establishing this greatest breed of dairy cattle.

SAN JOAQUIN POLAND BREEDERS TO HOLD INITIAL SALE

On Friday, September 19, the San Joaquin Poland-China Breeders Association will hold a public sale of Poland-Chinas in Lodi. As this is the time of year when the farmers and pork producers begin looking for boars for their fall breeding operations this association thought it would be a splendid idea to select a number of young boars for this sale. The sale will give those looking for boars an opportunity to make their selections without the necessity of visiting a number of herds to secure what they need. These boars have been carefully selected as to breeding, size and quality. Boar sales, for this very reason, are popular in the Eastern states, so why not in California? However, this sale will not be strictly a boar sale, but 25 high class sows and gilts will also be offered, bred to the already popular sires owned by members of the association. Col. Leachman will act as auctioneer.

TO DISPERSE POLAND HERDS

It is to be regretted that two such herds of Poland-Chinas as those of Dimmick Bros., and C. G. De Raad are to be dispersed. Mr. De Raad has sold his ranch and the Dimmick boys are dissolving a partnership existing between Oscar and Clarence, due to Oscar having moved to another county. These two herds have been built on a solid foundation and represent several years of hard work, much thought and the purchase of foundation animals at whatever price necessary to secure representative blood lines.

Both Mr. De Raad and Dimmick Bros. made purchases last spring from some of the leading herds, and these will all be sold in this sale. As these animals are of the most popular big type blood lines, both breeders and farmers will in this sale be afforded the opportunity of adding to their herds, at their own price animals of superior merit.

ANNUAL KINGS COUNTY POLAND SALE

One of the features of Poland-China circles in this state is the semi-annual sale of the Kings County Poland-China Breeders Association.

The next sale of the association has been set for Saturday, October 11, and at that time 80 head of bred sows, gilts and boars will be sold.

The following have made entries for this sale: G. I. McCune, G. Nehls, C. L. Newport, H. E. McMahon, W. L Haag & Son, T. J. Woodworth, R. G Hamblin, H. D. McCune, R. L. Walz, C. A. Vaughn, W. T. Dice, W. S. Hubbard, J. A. Crawshaw, M. Bassett, C. G. De Raad, C. Dimmick, J. M. Bernstein, E. G. Meyer, W. Bernstein and F. D. Ross.

Harvesting of Bartlett pears has begun in El Dorado, Nevada and Placer Counties. The crop is reported the best ever.

A large drying plant for grapes and prunes is soon to be erected at Cloverdale, Sonoma County.

THE BIG BANNER SALE OF 1919

40 Poland-China Bred Sows and Gilts 40

Fair Grounds, Hanford, Calif.

Wednesday, September 17

Lendorris Liberty Bond

JOHN M. BERNSTEIN and W. L. HAAG & SON a carefully selected lot of Poland-China bred sows and gilts of strictly *big type* breeding that will leave a lasting impression on the Poland-China breed in California.

The Yankee Jr.

LENDORRIS LIBERTY BOND brings to California the blood of one of the greatest living boars, being a son of L. H. Glover's world's famous boar, LIBERTY BOND. The thinking breeder will appreciate the opportunity for securing this blood.

THE YANKEE, "King of the Breed", sends to California one of his best sons in THE YANKEE JR., to assist in the production of better Polands. A. D. Severe and M. A. Dowling head their herds with sons of THE YANKEE. Get this blood in your herds.

The breeders who keep in touch with the world's best Poland-Chinas will realize that in these sows we are offering a real opportunity to strengthen their herds. Haag & Son will sell 17 sired by YOUNG JUMBO and bred to LENDORRIS LIBERTY BOND. YOUNG JUMBO has proved his ability to sire the kind that are in demand. His open gilts topped the October and February sales. A. D. Severe said, "You can pick out his pigs wherever you see them." Haag & Son will also sell two by KING'S BIG BONE LEADER, grand champion boar of 1918, bred to YOUNG JUMBO, and one by KING'S JUMBO ORPHAN, bred to LENDORRIS LIBERTY BOND. John M. Bernstein will offer four sired by Frazier's Timm 2d; five by GIANT JONES, selected from the E. D. Frazier herd. Mr. Frazier says of Giant Jones: "He is a great son of GERSTDALE JONES and from a GIANTESS and BIG BOB sow"; three by K's BIG PRICE 2d; one by CALIFORNIA SMOOTH JUMBO; two by MILLER'S LONG CHIEF; one by KING'S BIG BONE LEADER, and two by YOUNG JUMBO. All are bred to THE JANKEE JR. A daughter of BLUE VALLEY TECUMSEH sells bred to PRESIDENT.

The East no longer dominates the Poland-China field when such sows and gilts sired by the above well-known boars and bred to THE YANKEE JR. and LENDORRIS LIBERTY BOND can be bought at public auction in this state.

Breeders---Farmers

attend this sale and buy the kind of Poland-Chinas that will return you a quick profit. We expect these boars to create a national demand for their pigs and this is your chance to share in the prosperity. We feel confident that the wonderful development of the Poland-Chinas is on a permanent basis and we hope, by this offering, to assist the development.

After a careful review of this offering can anyone doubt that this will be the BANNER POLAND-CHINA sale of the year?

Write to either John M. Bernstein, Hanford, or W. L. Haag & Son, Hanford, for Catalogs and mark your selections

Sale will start promptly at 12:30. Lunch served at 11:30 A.M.

The Offering Has Been Immunized. *Come to This Sale*

John M. Bernstein W. L. Haag & Son

H. M. Bernstein, Auctioneer

Looking Forward

I am now planning for my Big SPRING SALE OF POLAND-CHINAS.

How Well? Look at these---

KING'S BLACK PRICE, a son of the WORLD'S GRAND CHAMPION BLACK PRICE, is one of my new herd boars.

KING'S BIG BEN, by BIG BEN, is another.

CHIEF'S DEFENDER CHOICE is the sire of a third boar.

I have also a choice lot of strictly big type gilts, including a daughter of BLACK PRICE

My next sale in the spring of 1920 will be unusually attractive

Wm. Bernstein **Hanford, Calif.**

The Greatest Herd

---OF---

Big Type Poland Chinas

on the Pacific Coast

Competent judges have pronounced this herd the best balanced, biggest boned, both sows and gilts, and strongest backed herd on the Pacific Coast.

King Jones Over

(See His Picture)

represents years of constructive BIG TYPE breeding and his pigs show these outstanding qualities. This premier sire mated with our big boned, high backed sows is siring Poland Chinas that should be on every farm on the Pacific Coast where profitable hogs are sought. As proof of these assertions see our herd at the STATE FAIR. You will then determine to get this blood in your herd.

Sound Live Stock Advertising

By R. P. Royce

NEXT in importance to the successful production of acceptable pure bred live stock one of the big problems that the breeder has to solve is the disposition of his product at satisfactory prices. The problem of distribution is the same tremendous factor in all lines of industry and is in no way different in the pure bred live stock business than in any other business.

The prime reason for entering the live stock business is to make money, and unless one's bank account shows a substantial growth each year the breeder can count himself a failure, no matter how good stock he may produce, unless, of course he had some misfortune.

All are familiar with that much quoted bit of philosophy that the world will seek out the maker of superior mouse traps regardless of location, and, while it is not so stated, the inference is that the mouse trap man will eventually be accorded wide patronage regardless of the amount of advertising he may do. It is perhaps true that one can acquire considerable reputation by word-of-mouth publicity, but it must be admitted that such a method is entirely dependent on the element of time, and that is money.

It is not the intention of the writer to make out a case for advertising, because the value of advertising is so generally admitted, but it is his intention to suggest that there is no reason why practically the same methods used for successful distribution of merchandise cannot be applied to the pure bred business, and to urge that breeders give more care and thought to their advertising space and copy.

Admitting at the start that advertising is a necessary part of any successful business, then it should not be regarded as an expense but as a part of the business, just as much as breeding, feeding and management, and money spent for advertising should not be regarded as useless expense, but as part of the investment.

Before a man can be a successful advertiser he must first be thoroughly sold on the value of publicity. He must regard advertising as a strictly business proposition, and he should give his publicity the same careful thought that he gives other of his business affairs.

Advertising space costs money, a fact that should not deter the breeder. When one glances through the advertising columns the impression is easy to acquire that the average breeder is paying slight attention to this copy. Some men are spending too much, others not spending enough and many are spending unwisely.

Most men pride themselves on their business ability. When they make any investment they expect to get value received. Yet there are any number of live stock breeders who apparently forget that when they buy advertising space they are spending money and that it is largely up to them whether or not they get the most out of their expenditure. One buys space to insert an advertisement; one inserts an advertisement for the purpose of attracting the reader with the idea of selling him. The advertisement that attracts the buying public and puts forth the best selling talk is the advertisement that pays.

It seems to the writer that live stock advertisers should consider their publicity from the following angles:

As stated above, the breeder must believe in the value of judicious advertising, else he will lack enthusiasm. He must understand that unless he is producing meritorious stock he can not expect to enjoy the best trade. A clever advertiser may succeed in fooling the public for a time, but he can rest assured that sooner or later he will be found out, and his herd or flock will be rated for what it is worth.

There is a streak in most of us that tends to elevate our own stock unduly and to depreciate the value of our neighbor's. It is well to think well of our own stuff, but it is fatal to develop a state of mind wherein we can not recognize merit wherever found and regard our own products at their real worth. Contact with other herds and flocks by personal visits, and attending sales and shows, is the best method for acquiring a sense of values and a true appreciation of one's own herd.

Once the breeder knows the legitimate values of what he has to sell, he is in a position to establish sound values and to estimate rather closely the volume of business he can expect to transact. This knowledge is highly essential to judicious advertising for the reason that one can then determine about the amount of money he can afford to spend in disposing of his annual surplus. No matter how much business one may do in the course of his fiscal year, if his operations fail to show a profit he has made a failure. One of the most successful live stock advertisers the writer knows has his business on a basis where he can estimate its probable volume for the year. He then sets aside a fixed amount that he feels he is justified in spending in order to transact that volume. This amount, once determined on, is regarded as necessary selling expense and is charged up to the general costs of operation.

A list of farm and live stock papers that his past experience has indicated are profitable mediums to use is made up and the amount to be spent with each paper is determined upon and space bought on that basis. The whole matter of newspaper advertising is then settled at once on a business basis, and knowing this, the advertising representatives know what to expect and work on that basis.

Having decided on the amount of advertising appropriation, the next problem for the breeder consists in the preparation of the copy. The value of an advertisement, aside from the medium used, depends solely on what is said, the manner in which it is said, and the attractiveness of the copy. In preparing advertising copy the fact should not be lost sight of that before an ad can sell, it must attract the reader's attention. Therefore the effort should be made to prepare a layout that lends distinctiveness to the copy, a make-up that sets the ad out from the others on the same page. This may be accomplished by the use of a cut, a distinctive border, the use of rule lines or by a special design and type face. There seems to be a growing disposition on the part of the keener advertisers to adopt specially made designs. These designs are the work of artists and the charge for such work is quite reasonable. The old idea of freak advertisements, based on freak headings and pictures, running the copy upside down, etc., has long since lost its force, if indeed such practice ever had force.

Another point to bear in mind is that force in an advertisement is not solely dependent on how much is said but rather on how it is said. Some advertisers proceed on the theory that in order to get the most out of advertising space it should be jammed as full as possible of reading matter. It is a mistake to attempt to crowd too much in a given space. Much effectiveness can be obtained by the use of white space. In the preparation of copy advantage should be taken of all legitimate facts calculated to create interest and convince the reader. Facts concerning the breeding and records of the herd, stated in a brief, clear and straight-shooting manner should always be used, and it has always seemed to the writer that the dominant note of profit accruing to the purchaser should be stressed. Most men buy breeding stock because they have been convinced that pure breds can increase their profits, and such being the case, it is up to the individual advertiser to convince the prospect that the herd in question can supply the breeding material that will meet his demands to better advantage than other herds. The same copy should not be used continuously, but should be changed frequently and always kept fresh. An advertisement

obviously intended to sell boar pigs in the fall lacks force the following spring or summer. A "dead ad" suggests a dead advertiser.

The advertiser should realize the limitation of advertising. An advertisement should only be expected to bring a good class of inquiries. The matter of sales will depend very largely on the ability of the breeder to close the deal by proper handling of the inquiry. All inquries are entitled to prompt, full and courteous replies. Remember that you are selling in competition with other breeders and that the chances are strong that the prospect has written other breeders. The man who sells him will be the man who gets the most convincing letter in the shortest time. Confidence can be created by the letter written, the attractiveness of the stationery, the promptness of the reply and by straightforward detail statements.

Every inquiry received represents a possible buyer and is an asset to the breeder. Therefore a careful list of all inquiries should be kept, and a mailing list built from them.

The use of attractive herd catalogues and mail matter, showing and all other publicity should be taken advantage of, but should be regarded as supplementary to the advertising carried in high class farm journals, breed papers and newspapers.

To the question "When should a breeder advertise,' the answer is "always." Efficient advertising is continuous advertising. The theory of advertising is based on psychology and a continued campaign on the mind of the public to convince that the advertiser has what the public wants. Carefully prepared copy, persistently used, will in time force the public mind to associate a name with a particular thing. That the above is true is susceptible to abundant proof. But advertisers often reach a point when they feel that through persistent advertising they have established themselves in the public mind to such an extent that they can afford to drop out of the advertising columns. Such an idea is a fatal mistake—and a costly one. It is fatal to assume that the public will remember long, unless constantly reminded. The world moves rapidly and the public forgets easily. It is a costly mistake to believe that one can afford to drop out for the reason that when one does, and his advertisement no longer confronts the public, he is throwing aside all the money spent in building his standing. The value of advertising is cumulative. An advertisement is worth more the second year than the first, more the third year than the second, and increases in value proportionately to the length of time it appears.

The beginner faces the problem of when to start adverttising—and usually feels that he should not start until he has something to sell. Therein he makes a mistake. The time for a new breeder to begin advertising is before he has anything to sell. Naturally, it will take some time to establish himself with the public, and he should lose no time in doing so. If, on the other hand, he waits until he has something to sell before he starts his publicity, he will have to be content to wait until he establishes his name as a breeder before he can expect to attract buyers, and in the meantime he is forced to the expense of carrying his sale stuff longer than had he paved the way for sales while his stock was reaching sale age.

The man who feels that he cannot afford to advertise when he is sold out is losing sight of the fact that the discovery on the part of the inquirer that a breeder is sold out constitutes the best sort of advertisement because it indicates to the inquirer that the productions of the herd are in demand, and that knowledge will stimulate a desire to obtain stock from that herd when again in the market.

Another feature of herd management that can be made a useful form of publicity is the general air of neatness about the home place. It is not necessary that elaborate and costly improvements be made on a breeding farm. As a matter of fact, from a practical standpoint such improvements are to be discouraged—they add to the overhead charges and usually are constructed more with regard to the outside appearances than to the comfort and health of the stock. But there is no denying that a neat, clean

Get Ready for the Big

Poland China

SALE

Hale I. Marsh, Modesto — Les McCracken, Ripon

Modesto, Saturday, October 4, 1919

The POLAND-CHINA breed has had many triumphs the past several months and we expect this sale to add to the list.

50 Bred Sows and Gilts 50

representing the cream of these two herds, with a combination of blood lines rarely found in single offering. What does it mean to the Poland-China breed when you can buy at public sale daughters of such boars as MODEL MAJOR, first prize aged boar at Sacramento in 1916, grand champion at Modesto and Fresno and the sire of Major Hadley Wonder, grand champion at Sacramento in 1917? What does it mean when you can buy at public sale daughters of KING'S BIG BONE LEADER, grand champion boar at the 1918 California State Fair, and a boar whose fame has spread from one end of the Pacific Coast to the other, a boar that has more sons at the head of good herds than any two boars on the Coast?

As further evidence of this offering there will be daughters of MAJOR HADLEY WONDER, I. B. A. WONDER (reserve grand champion at the P. P. I. E.), BLUE VALLEY TECUMSEH, LODI GIANT, greatest son of I. B. A. WONDER, JOE'S KING by KING JOE and out of the great sow MISS BOB 2d.

What This Blood Means to Pacific Coast Poland-Chinas

is intensely magnified by the importance of the boars to which the offering is bred. Pay particular attention to the great array of boars to which these sows are bred—KING'S BIG BONE LEADER, grand champion at the 1918 State Fair; MAJOR HADLEY WONDER 2d, and BLUE VALLEY BIG BONE. None better bred—no better pedigrees can be written.

To make this sale we have refused orders all summer. We are offering sows and gilts in this sale that will command the respect of all breeders and every farmer who has the best interest of his future at stake.

It is of the greatest importance that you get your catalog early and acquaint yourself with the breeding of the offering.

Every animal in this sale is immune from cholera

The sale will start promptly at 10:30 A. M. Lunch served at noon.

When writing advertisers, mention The Cultivator.

ranch, with well painted and repaired buildings and fences inspires confidence and respect in visitors. They suggest prosperity, and the visitor gets the idea that stock proving profitable to the breeder will prove profitable to the buyer.

The writer is conscious that he has touched only a few of the problems of publicity and that much more could be written. But becauses he recognizes that successful selling in the end is the most important of a breeder's operations, and because he knows that more careful attention to publicity will result in more sales, the above is offered for what it is worth.

THE POLAND-CHINA SALE AT FRESNO

The first consignment sale of the Fresno County Poland-China Breeders Association was held Wednesday, August 20, on the grounds of the Fresno district fair association. The sale was exceedingly satisfactory, and the results of this sale should prove to every breeder the stability of the live stock industry. Fifty-one bred sows and gilts were sold for a total of $6125, making an average of $120.10. The top came from the herd of A. Buckland & Son on Bonnie Mc., E. E. Lapelle of Caruthers being the purchasers at $335. As a special attraction a young gilt was given away, Mrs. T. J. Woodward of Stratford holding the lucky number.

Geo. W. Bell of Tulare was the auctioneer and although he was so ill he could hardly stand, held the crowd until the last animal was sold.

Following is detailed report of the sale:

CROSS BROS.

Merced, Calif:

We are establishing a herd of exclusively big type Poland-Chinas. We have drawn on many of the leading herds for our foundation sows. We have a son of Golden Gate King, the phenomenal sire of A. D. Severe. Negotiating for the purchase of a son of one of the greatest Poland-China sires in America.

We will soon be in a position to supply foundation stock of real

Big Type

Poland-Chinas

Where the BIG ONES Are Bred

My big type Poland Chinas are found in nearly every county in the state. Model Fellow, a boar that has accomplished great things for the breed, came from my herd. Present herd boar Cantrall's Ideal by Big Joe. He has been mated with such sows as Model Lady, an 850 pound sow by Long Model; Blue Valley Mollie by Blue Valley Again, and others of equal quality.

Such matings suggest why my Poland-Chinas are in such strong demand by breeders and farmers.

A few outstanding spring pigs of both sexes that I will price reasonable. Complete description on request.

Go over the above records of wonderful dairy produ relation to wha

In the process of our yearly test work we have learned the producing abilities of the various families within our herd more thoroughly than would be possible under any other method.

We have been guided in our matings and selections by the figures which the Babcock test and the scales have shown us, coupled with a full measure of attention to type, vigor, and reproductive qualities. In our breeding operations we have never for a moment lost sight of the fact that the function of a dairy cow is not to produce largely for 7 days or 30

Sir Aaggie De Kol Acme 185724

Sire: Aralia De Kol Pontiac Segis 112077

Dam: Aaggie Acme of Riverside 2nd 164167

His three nearest dams average:
Two Years: Butter 2127.28 lbs. Milk 43,555.7 lbs.
One Year: Butter 1175.74 lbs. Milk 24,378.2 lbs.
Seven Days: Butter 31.25 lbs. Milk 642.5 lbs.
His son sold for $11,000.00 at Philadelphia in June.

His Dam—
AAGGIE ACME OF RIVERSIDE 2ND 164167
Two Years: Butter 2426.88 lbs. Milk 44,267.3 lbs. One Year: (Strictly official) Butter 1331.78. Milk 24,690. (World's official butter record for one year.) Seven Days: Butter 35.23 lbs. Milk 627.30 lbs. Dam of Miss Aaggie Acme Burke who made 26.18 lbs. butter in seven days, 106.53 lbs. in 30 days at 2 yrs., and promises to make around 1000 lbs. butter this year with first calf.

His Sire's Dam—
ARALIA DE KOL 55194
Two Years: Butter 2093.01. Milk 51,012.6 lbs. One Year: Butter 1142.32. Milk 28,090.0 lbs. (World's milk record when made.) Seven Days: Butter 30.14. Milk 742.30 lbs. She has one daughter with a strictly official record of 1215 lbs. butter in one year, another with semi-official of 1100 lbs., a granddaughter with 1161 lbs. butter in one year, and a granddaughter that made 932 lbs. butter in one year as a 2 year old with first calf. A son of this heifer sold for $11,000 at Philadelphia in June. She is the only 1100 lb. cow that has two daughters and a granddaughter above 1100 lbs.

Sir Aaggie De Kol Mead

Sire: Sir Aaggie De Kol Acme 185724

Dam: Miss Valley Mead De Kol Walker 250936

Five of his seven nearest dams average:
Two Years: Butter 2040.75 lbs. Milk 41,537.9 lbs.
One Year: Butter 1130.50 lbs. Milk 23,087.4 lbs.
(Including his dam's 2 and 3 year old records, one granddam's 3 and 4 year old records, and one granddam's 4 year old record.)
His seven nearest dams average:
Seven Days: Butter 30.54 lbs. Milk 626.3 lbs.

His Dam—
MISS VALLEY MEAD DE KOL WALKER 250936
Two Years: Butter 1903.95. Milk 38,966.70. (Record made at 2 and 3 years, both short years because of calving within 12 months of previous freshening.) One Year: (At 3 yrs.) Butter 1113.58. Milk 21,975.8. (Second highest butter record in class when made.) Seven Days: (At 3 yrs.) Butter 36.81 lbs. Milk 688.60. One of the greatest heifers of the breed. Won California Dairy Cow Competition over all ages and breeds. Broke world's records in 3 months after calving divisions both as 2 and 3 year old.

His Sire's Dam—
AAGGIE ACME OF RIVERSIDE 2ND 164167
Two Years: Butter 2426.88 lbs. Milk 44,267.3 lbs. One Year: (strictly official) Butter 1331.78. Milk 24,690. (World's official butter record for one year.) Seven Days: Butter 35.28 lbs. Milk 627.3 lbs. Here is one of the best individuals and producers of the breed. Her first daughter to freshen as a junior 2 year old made 26.18 lbs. butter in seven days, 106.53 lbs. in 30 days, and is the heaviest milking 2 year old we have yet bred. She is now on yearly test and promises to make well up to 1000 lbs. butter this year.

Holstein Comment

R. F. Guerin, Visalia, has an unusually choice lot of registered Holstein heifers just coming to milking age. Most of these are sired by Sir Veeman Korndyke Pontiac, 30-pound son of Sir Veeman Hengerveld. One of the first of them to freshen made over 20 pounds butter in seven days as a junior two year old, and there are many others fully as promising. One of the star attractions of the herd is the $3950 cow K P Tola, who is a 33.98 pound daughter of King of the Pontiacs. The herd sire is King Sadie Vale Idyl Segis, son of King Korndyke Sadie Vale 27th and the 35 pound state record junior four-year-old, K P Idyl Segis. From a small beginning, and with good management, Mr. Guerin has built up one of the most successful western herds. We recollect offhand that in three public sales he has made sales aggregating something over $42,000 and believe that he will concede that he has the best bred and most promising lot of heifers he has ever owned right on the ranch today. One strong factor in this success is the fact that good herd bulls have always been selected, an effort having been made to have each succeeding head of the herd better than the one before.

R. C. Sturgeon, Tulare, is making substantial progress with his herd of registered Holsteins. The beginning of official testing in the herd has shown some satisfactory records, including a 19 pound junior two-year-old, and several more good ones may be looked for during the coming season. The $3200 head of the herd, Segis Pontiac Abbekerk, is developing beautifully and is growing into a flash fellow of great size and quality. He is by Segis Pontiac De Kol Burke, one of whose daughters sold at Philadelphia for $11,200 last June. His dam is Changeling Tidy Abbekerk Gem, who has one record above 35 pounds in seven days, and she made over 34 pounds at the previous freshening. His first calves are choice, and his daughters can be expected to become great producers.

T. J. Gist & Sons, Tulare, have a well bred herd of registered Holsteins that rank among the leaders in the San Joaquin Valley. There are many cows and heifers with creditable official records in the herd, and more will be placed on test during the coming season. Their herd is headed by King Sadie Vale Rose, a son of the great King Korndyke Sadie Vale and out of the great producing cow Queen Rose Paul who has several records above 26 pounds butter in seven days, her last one above 27 pounds. He has developed noticeably within the past year, and his calves are a well marked, straight lot of high promise.

Things just naturally grow at Jane Garden Farm, owned by Fred W. Kiesel, Sacramento. The ranch produces tremendous crops of alfalfa and corn, and these are in turn helping to a wonderful crop of registered Holsteins. From a well selected foundation herd of females, mated with the three outstanding bulls, Sir Aaggie De Kol Acme, Prince Gelsche Walker Korndyke, and King Korndyke Pontiac, a herd of unusual merit is being developed. One of the big factors in the herd is the growthiness of the young things, and while the real program of official testing has not yet gained full headway in the herd, yet the daily milk sheets and the official records that have been made indicate that no mistake has been made in the selection of individuals and blood lines.

Seventy-five granddaughters of Tilly Alcarta ought to be a whole herd by themselves, but that number is only part of the herd of registered Holsteins owned the J. S. Gibson Company, Williams. These seventy-five are all daughters of Prince Alcarta Korndyke, son of Tilly Alcarta, who has for some years headed the Gibson herd. Two of them are now going at the rate of around 1000 pounds butter, after having made over 30 pounds and over 31 pounds butter in seven days respectively, at the beginning of their lactation periods as senior four-year-olds. It is likely that a substantial number of official records will be reported from this herd during the coming season.

James McGillivray, Sacramento, now has one of the largest herds of registered Holsteins on the Pacific Coast, right up around 350 head. Official testing will again be taken up in the herd this season, and the material is most promising. Three bulls of unusually rich breeding now head the herd, Yolo Valdessa Hengerveld, a 30 pound son of King Valdessa; Prince Echo Sylvia Segis, a grandson of May Echo Sylvia; and Rag Apple Walker Korndyke, a grandson of Rag Apple Korndyke 8th. James Sullivan recently became herdsman in the McGillivray herd.

The tremendous records of milk and butter production made in the herd of registered Holsteins owned by A. W. Morris & Sons Corporation, Woodland, form one of the most interesting chapters of modern dairy history. The Morris firm will always live in dairy history as a pioneer in yearly record development, and they have consistently practiced what they have preached, that the yearly record is the truest indication of a cow's ability to produce. Because they have followed their original ideas so closely, they have today what is unquestionably the greatest herd of yearly record cattle in the whole world, and practically all of the cattle are of their own breeding. They have found it possible even to breed their own herd bulls, not entirely from choice in every instance perhaps, but rather from necessity, for it has not been possible for them to go outside of their own herd and secure bulls of greater yearly record backing than they themselves were producing. Finally they have developed certain families within their herd to a point of certainty that makes bulls of their own breeding within these families the logical bulls to head their own herd. The four bulls at present in service represent the very best families they have developed to date, and probably never in the history of their breeding operations have they had so many outstanding heifers approaching milking age. All of the young stock in the herd is raised on pasteurized milk, a practice that has been followed for several years in the herd, and a great deal of attention is given to raising the young stock under the most healthful conditions.

H. E. Spires, Caruthers, has at the head of his herd a son of the great King Segis Pontiac Count, whose daughters have been breaking records consistently in Senator Hackney's herd in Minnesota. To mate with him Mr. Spires has a herd of well selected females of approved breeding, and the herd is gradually growing in numbers. The presence of this richly bred sire at Caruthers means much to that good dairy section.

H. H. Sisson of Sunnybrook Ranch, Willits, writes: "We have recently bought from Broad Meadows Farms, Pawling, New York, a remarkably well bred bull calf, a son of The Mighty Monarch, Mr. Brady's famous herd sire. The sire of The Mighty Monarch is King of the Pontiacs, and his dam, Segis Hengerveld Fayne Johnson, who recently sold at the Cabana sale for $40,000, the highest price ever paid for a dairy cow at public auction, and who is half sister to Rag Apple the Great, who sold for $125,000 at the same sale, he being the higest priced bull in the world. The grand dam of The Mighty Monarch is Segis Fayne Johanna, the first cow in the world to make 50 pounds of butter in seven days. The Mighty Monarch's dam has a seven day record of 47.35 pounds of butter and 699.1 pounds of milk; his grand dam's record is 50.68 pounds of butter and 730.8 pounds of milk in seven days; 95.42 pounds of butter, 1459.1 pounds of milk in 14 days, and his great grand

Continued on Page 263

Willowmead Holsteins

325 Registered Individuals of Choice Breeding

Headed By

Yolo Valdessa Hengerveld 184353

His Sire: KING VALDESSA, whose dam was the first cow to make over 41 lbs. butter in 7 days and over 164 lbs. in 30 days. His sire is out of K P Pontiac Lass, the first cow to make over 44 lbs. butter in 7 days and over 171 lbs. in 30 days.

His Dam: FINDERNE HENGERVELD SOLDENE, with official records of 30.44 lbs. butter from 537.6 lbs. milk in 7 days as a senior 4 year old, she a granddaughter of Hengerveld De Kol and out of a daughter of De Kol 2nd's Butter Boy 3d.

YOLO VALDESSA HENGERVELD carries some of the very greatest producing and transmitting blood of the breed on both sides of his pedigree, is almost white in color, and an individual of high excellence. The records of his dam, his sire's dam, and his sire's granddam average:

Butter 30 days	149.68 lbs.
Milk	2536.20 lbs.
Butter seven days	38.83 lbs.
Milk	606.00 lbs.

Prince Echo Sylvia Segis 247369

His Sire: CHAMPION ECHO SYLVIA PONTIAC, who is by a son of the first 44 lb. cow, K P Pontiac Lass, and is out of the world's record cow May Echo Sylvia, the only cow to make over 1000 lbs. milk in 7 days, and she the dam of the $106,000.00 bull Carnation King Sylvia.

His Dam: PRINCESS STELLA SEGIS, who who made 29.88 lbs. butter from 507.2 lbs. milk in 7 days as a senior 4 year old, she a daughter of King Pieter out of a 31.70 lb. daughter of King Segis.

PRINCE ECHO SYLVIA SEGIS is a splendid individual, evenly marked in color. No better blood lines have yet been developed in the black and white breed, large milk production with desirable per cent of butter fat appearing consistentiy on both sides of his pedigree. The seven nearest dams of Prince Echo Sylvia Segis average:

Butter seven days	31.75 lbs.
Milk	582.55 lbs.
His fourteen nearest dams average:	
Butter seven days	29.45 lbs.

Rag Apple Walker Korndyke 266362

His Sire: RAG APPLE KORNDYKE COLANTHA, who is by the $60,000 bull Rag Apple Korndyke 8th, out of Colantha Pietertje Korndyke, a 30.80 lb. junior 4 year old daughter of Pontiac Korndyke.

His Dam: ABBY HARTOG CLOTHILDE 2ND, a 27.16 pound 4 year old daughter of Admiral Walker Gelsche and the great 31.39 lb. producing and breeding cow Abby Hartog Clothilde. She has five A. R. O. daughters, her dam has five A. R. O. daughters, and her sire's dam has five A. R. O. daughters.

RAG APPLE WALKER KORNDYKE is the youngest of our three herd sires, and promises to develop into an individual of great merit. Five of his seven nearest dams average:

Butter seven days	31.30 lbs.
Milk	578.28 lbs.

Five of his seven nearest dams have produced a total of 22 A. R. O. daughters, six of which have official records above 30 lbs. butter in seven days.

These three richly bred bulls are being mated in this herd with females of most substantial breeding, a large number of which are daughters of Dutchland Sir Korndyke Colantha, who is by Dutchland Sir Pontiac Rag Apple, full brother to Pontiac Clothilde De Kol 2nd, the first cow to produce over 37 lbs. butter in seven days and over 1270 lbs. in one year, and to the former world's record cow Pontiac Rag Apple, the dam of Rag Apple Korndyke; daughters of King Pontiac Ruby Burke, proven son of King of the Pontiacs; daughters of King Mead of Riverside, whose daughters include the world's record cow Aaggie Acme of Riverside 2nd; and to daughters of other sires of the best breeding.

We can supply you with a good bull to improve your herd at a price you can afford to pay. Come and see the herd or write your wants.
The farm is two miles south of Sacramento City limits on paved Freeport Road. Go straight south on Twenty-first Street out of Sacramento.

James McGillivray
Sacramento, Calif.

COMBINATION SALE

Henderson Company
Sacramento, Calif

Bonita Stock Farm
Lodi, Calif.

65 Registered Holsteins

Stockton, California, Thursday, September, 18, 1919

HENDERSON COMPANY herd at present contains 333 head of registered Holsteins of splendid breeding, and the herd has now reached a size where it is possible to offer surplus breeding stock regularly.

BONITA STOCK FARM herd now numbers 160 head of registered Holsteins, which is about the carrying capacity of the ranch, and from now on regular offerings of breeding stock will be made.

The present offering from both herds contains a desirable lot of young cows and heifers, among them some of the heaviest milkers in the herds, EVERY FEMALE OF BREEDING AGE IN THIS SALE IS EITHER FRESH OR WELL ALONG WITH CALF TO A GOOD SIRE. This fact makes it an especially good sale for the buyer who wants to start with a few head of substantially bred, young cows or heifers in calf to some of the greatest bulls in service in California.

Many of the Females are Bred to these Four Great Bulls

King of the Black & Whites

The first bull whose seven nearest dams averaged over 30 pounds butter in seven days, six of them 30 pound cows, and four of them with 30 pound daughters that have produced 30 pound daughters, each with above 126 pounds butter in 30 days.

KING OF THE BLACK & WHITES has the largest list of A. R. O. daughters of any bull on the Pacific Coast. One of his daughters recently made over 800 pounds butter from over 20,000 pounds milk in one year as a junior 2 year old, and another made over 30 pounds butter in seven days.

A daughter of KING OF THE BLACK & WHITES sold for $2000.00 in the last Philadelphia sale and her heifer calf sold for $2100.00. There are now 27 daughters of this great sire in the Henderson herd and it is not the intention of the owners to offer any of them for sale. They are of excellent type, with a quality of udder that is an outstanding characteristic.

King Pontiac Segis Inka

A son of the great bull King of the Pontiacs, who has more 40 pound daughters, more 30 pound daughters, and more A. R. O. daughters than any other sire.

The Dam of KING PONTIAC SEGIS INKA is Segis Inka 3d, a daughter of the great sire De Kol 2nd's Butter Boy 3d and Segis Inka whose daughter A & G Inka McKinley is the dam of King Segis, one of the greatest sires the breed has ever produced.

As an index to the excellence of the nick in this breeding it is significant that K P Segis Inka, a daughter of King of the Pontiacs and Segis Inka, produced over 26 lbs. butter in seven days and over 811 lbs. in one year as a senior 2 year old.

The get of KING PONTIAC SEGIS INKA are unusually satisfactory. Both his sons and daughters show an unusual degree of quality, and dairy type that is both pleasing and promising. A large number of his young daughters are now in the Henderson herd where they will be given an opportunity to make records as they freshen.

King Lillian Walker Segis

A son of King of the Black & Whites, our senior herd sire. His dam is Lillian Walker Pietertje 2nd, who made 24.69 lbs. butter in seven days as a senior 4 year old, she by King Segis and out of the 30 pound cow Lillian Walker Pietertje, whose dam is the 30 pound cow Beauty Pietertje, daughter of the famous foundation cow Prilly.

The breeding of KING LILLIAN WALKER SEGIS combines closely the great producing ancestry of King of the Black and Whites with the blood of King Segis and the richest direct line to Prilly, one of the foremost transmitting cows of the breed.

The calves from KING LILLIAN WALKER SEGIS are among the best in the Henderson herd, and his daughters look fully capable of making a large place for themselves in the production lists when they come in milk.

Supreme Glista Pietje

A bull of superb individuality and rich breeding. He is by Woodcrest Pietje Ormsby, whose sire is a son of Pietje 22nd, 31.62 lbs. butter in seven days, 566.68 lbs. butter in six months, the highest records ever made by an imported cow.

The dam of SUPREME GLISTA PIETJE is Glista Englantine, who has twice made over 32 lbs. butter in seven days, she being the full sister to Glista Erica with records of 35.29 lbs. butter and 32.65 lbs. butter to her credit in seven days in to successive lactation periods. She is also three-quarter sister to Glista Ernestine, one of the three cows of the breed to have five seven day records averaging over 33 lbs. butter in seven days.
ter in seven days.

SUPREME GLISTA PIETJE is called "The King of High Testers" by his owners, the butter fat test of his nearest female relatives ranking at the very top. He heads the Bonita Stock Farm herd where a large number of his young daughters are coming on and will be tested as they freshen.

Bulls For The Breeder and Dairyman

There will be an excellent selection of young bulls in this sale, by the great herd sires listed above, and out of dams of sound breeding, type, and production. Among them is the show bull MODEL DOMINO GLISTA, a richly bred bull ready for service. There is also a son of King of the Black & Whites out of a 26 pound dam, good enough to head a herd of purebred females. His dam is one of the best cows in the Henderson herd and should increase her present record.

Every animal in this sale is positively guaranteed to be a breeder

No animal in this sale is tuberculin tested

Sale will be held at DARBY'S BARN, East Lafayette and Pilgrim Sts., Stockton, Calif., and will begin promptly at 10:00 A. M.

Sunnyside Holsteins

Headed by

King Sadie Vale Idyl Segis

His sire: KING KORNDYKE SADIE VALE 27TH, whose sire is King Korndyke Sadie Vale, the only 40 pound bull with a 40 pound daughter and a 40 pound sister. The three nearest dams of King Korndyke Sadie Vale 27th average 34 pounds butter and 591.7 pounds milk in seven days, 132.6 pounds butter and 2464.6 pounds milk in 30 days.

His dam: K. P. IDYL SEGIS, 35.57 pounds butter in seven days, 132.13 pounds butter in 30 days as a junior four year old. She is by the greatest A. R. O. sire of the breed, King of the Pontiacs, and is out of a daughter of Sir Gelsche Walker Segis who has two daughters above 38 pounds butter in seven days.

Five of the seven nearest dams of KING SADIE VALE IDYL SEGIS average 33.08 pounds butter in seven days, 128.96 pounds in 30 days.

K. P. TOLA, the 33.98 pound daughter of King of the Pontiacs now in Sunnyside Herd.

Besides daughters of such sires as King of the Pontiacs, King Morco Alcartra, King Walker Segis, and King Korndyke Sadie Vale 27th, this herd is made up largely of daughters of Sir Veeman Korndyke Pontiac, 30 pound son of Sir Veeman Hengerveld. His heifers are just now coming in milk and one of them recently made 20.32 pounds butter in seven days as a junior two year old.

WE HAVE SOLD MOST OF THE SONS OF SIR VEEMAN KORNDYKE PONTIAC BUT NOW OFFER TWO GOOD ONES, BOTH READY FOR SERVICE, AND BOTH WELL GROWN, GOOD INDIVIDUALS.

Come and see them or write for prices and pedigrees.

R. F. GUERIN, Owner **Visalia, Calif.**

King Sadie Vale Rose

Heads Our Herd

His Sire: KING KORNDYKE SADIE VALE, generally conceded to be one of the greatest sires ever produced by the black and white breed. He is the only sire having a 40 lb. dam, a 40 lb. daughter, and a 40 lb. sister. He already has seven daughters with records from 30 to over 40 lbs. butter in 7 days, and has a large number yet to freshen in good herds.

His Dam: QUEEN ROSE PAUL, with official records of 27.98 lbs. butter from 533.50 lbs. milk in 7 days, and her dam is the great producing and transmitting cow Highland Rose Paul, who made 32.41 lbs. butter from 550.2 lbs. milk in 7 days and has 5 A. R. O. daughters.

The three nearest dams of KING SADIE VALE ROSE average:

Butter 7 days	34.00
Milk	591.70
Butter 30 days	132.62
Milk	2464.60

In the first three generations of his pedigree we find the great sire King Segis, the first 30 lb. cow of the breed, Sadie Vale Concordia, and that wonderful producing and transmitting foundation cow Pontiac Clothilde De Kol 2nd, the first cow to make over 37 lbs. butter in 7 days and over 1200 lbs. butter in one year.

KING SADIE VALE ROSE is siring calves of unusual promise and in our herd is being mated with highly bred heifers and cows with official records up to over 31 lbs. butter in 7 days. Come and see us or write your needs when you want a good young bull.

T. J. Gist & Sons

Holberk Stock Farm

Tulare, California

Average Costs in University of California Dairy Herd

The dairy division of the University of California has recently issued some figures covering the cost of butter fat production, obtained from records kept on eight cows in the university herd. The figures are not intended to be representative of or applicable to all cows, by any means, or to be "bomb proof." Many cows are making decidedly better showings, but at the same time a large number are not doing so well. The figures are not given out as indicating what might be expected of the average California cow, they simply indicate the performance of eight average cows in the university herd. In view of the fact that the average production of the eight cows was 324.6 pounds fat, and that the average production for California cows is less than 200 pounds fat, and that with production of 324.6 pounds fat a profit of only $8.50 could be shown, after making proper charges, it would seem that the charges of profiteering among dairymen can hardly be established by the facts. The figures should also demonstrate to the average dairyman the necessity for raising the production of his herd through the use of good bulls, a method that is certain.

With an average production of 324.6 pounds of fat and a feed charge of $152.57 per cow, the average feed cost of a pound of fat was 47 cents and the average milk production of 8527 pounds had a feed cost of $1.78 per hundred weight.

The following tables show the detailed method used for arriving at the average cost of maintaining the cows for a year. Charging all items and crediting her with the butter fat and milk produced and placing a value of $10.00 on the calf, the net profit was $8.50 per cow. It should be pointed out that the cow was not given credit for the manure.

Average cow valued at	$150.00	
Interest at 6 per cent on $150.00 cow	9.00	
Depreciation on cow	5.00	
Loss from death—failure to breed	15.00	
Interest on money invested in buildings	4.00	
Depreciation and wear on equipment and buildings	5.00	
Service of bull	3.00	
Feed of cow when dry	12.00	
Labor	45.00	
Feed cost	152.00	
342.6 pounds fat @ 65c		$211.00
7500 pounds skim milk @ 50c per cwt.		37.50
Calf		10.00
Total	250.00	258.50
		250.00
Profit		8.50

The above tables are of interest to all dairymen, and while they are not representative of the better cows of the state, they at least suggest the paramount necessity for improving the quality of the average California cow.

FEED OF EIGHT COWS IN UNIVERSITY FARM HERD, 1918-1919

Name, Breed	Months in Milk	Alfalfa Hay	Silage	Bran	Barley	Oats	Linseed Oil Meal	Cocoanut Oil Meal	Molasses	Dried Beet Pulp	Cotton Seed Meal
Inka, Holstein	10½	8,224	5,115	878	609	345	72	206	98	878	142

May Rose, Guernsey	8	6,160	2,275	495	345	216	10	92	..	552	45
Antoinette, Gr.-Hol.	9	6,589	4,390	911	462	269	14	186	..	547	105
Ramona, Gr.-Hol.	11	7,967	5,398	933	492	341	16	193	..	552	93
Piet. 2d, Holstein	12	9,805	7,289	1295	788	322	58	319	38	733	183
Isabella, Gr.-Ayr.	12½	8,637	6,678	539	308	134	6	54	..	514	27
Carmen, Gr.-Hol.	13½	8,342	9,439	578	346	125	6	435	..	1193	127
Total	91.0	64,095	42,089	6169	3598	1882	188	1869	136	6093	837
Average	11.37	8,012	5,261	771	449	235	23	233	17	761	104

The following table shows the production of milk and butter fat for each of the cows and the average production for the eight:

Name, Breed	Months in Milk	Pounds Milk	Pounds Fat
Inka, Holstein	10½	10,992	406
Wopusa, Gr.-Hol.	14½	9,166	331
May Rose, Guer.	8	3,851	180
Antoinette, G.-H.	9	8,082	256
Ramona, Gr.-Hol.	11	8,506	390
Piet. 2d, Hol.	12	11,873	398
Isabella, Gr.-Ayr.	12½	7,125	320
Carmen, Gr.-Hol.	13½	8,624	316
Total	91	68,219	2597
Average	11.37	8,527	324.6

The feed charge of $152.57 was arrived at by figuring the average amount of feed consumed by each cow at the following prices:

Feed	Price Per Ton	Price Per Cwt.	Lbs. Fed	Cost
Alfalfa hay	$18.00	$ .90	8012	$ 72.11
Silage	6.00	.30	5261	15.78
Bran	45.00	2.25	771	17.34
Barley	55.00	2.75	449	12.34
Oats	55.00	2.75	235	6.46
Linseed Meal	75.00	3.75	23	.86
Cocoanut Meal	45.00	2.25	233	5.24
Molasses	35.00	1.75	17	.30
Dried beet pulp	50.00	2.50	761	19.02
Cottonseed Meal	60.00	3.00	104	3.12
Total				$152.57
Feed cost per pound of butter fat				.47
Feed cost per 100 pounds of milk				1.78

THE INTERNATIONAL BELGIAN HORSE SHOW

The rapidity with which the Belgian horse has gained popularity in all classes of draft work and especially its excellent performance in the army should make the First International Belgian Horse Show, to be held September 22 to 28 at Waterloo, Iowa, the greatest single breed horse show ever held. Another important factor which adds special significance to the show is that Belgium, stripped of her foundation stock, has become an importer instead of an exporter of the breed of horses which has made her famous. It has already been announced that a special commission from Belgium will attend the show for the purpose of purchasing stock upon which to rebuild the Belgian breed along the most approved lines in its native land.

The $5500 cash premium list offered has been increased by a number of substantial individual offers which add greatly to its attractiveness. The classifications have been carefully worked out by the show committee with the following objects in mind; First, to develop the Belgian horse industry in the most approved manner; second, to encourage the small breeder as well as the large breeder to show; third, to make the show of greatest educational value to the breeder and the general public.

The horses will be adequately housed in three new barns which will be completed by August 15. Exhibitors who are on the circuit and who do not have a fair at which to exhibit a week or ten days before September 22 are invited by the management to occupy the barns. A new judging pavilion with an arena 100 by 200 and a seating capacity of 6500

people will be ready for occupancy at the opening of the show. These buildings are being constructed as the permanent home of the International Belgian Horse Show on the grounds of the Dairy Cattle Congress which will be held on the same dates.

The judges who will pass upon the 300 head of horses that are expected to be exhibited are Samuel Bell, Wooster, Ohio; Eli Sprunger, Saginaw, Michigan; A. P. Coon, Lincoln, Nebraska. Wm. Crownover, the well known breeder, will act as superintendent of the show. The arrangements are in charge of Dr. T. U. McManus, Charles Irvine and J. H. Van Nice.

CATTLE AND SHEEP ON NATIONAL FOREST RANGES

The great live stock industry of the West is so largely dependent on the grazing lands within the national forests that the right management of these lands is of importance to every one who eats beef or mutton or wears shoes and woolen garments. A recent bulletin of the department of agriculture, "Range Management on the National Forests," by James T. Jardine, inspector of grazing, and Mark Anderson, grazing examiner, gives the results of the 14 years' experience in range management which the forest service has had since it assumed charge of the forests.

During these years the forest service has been working steadily to increase the country's supply of meat, wool and hides by developing methods of handling stock on the range which will allow as large an increase as possible in the number of sheep and cattle grazed without injury to the forests. With this bulletin as a guide, grazing can be made more uniform on different ranges, and the best principles can be put into actual practice.

Classification of the range to determine the areas best suited to the different classes of stock is the first important step toward the best use of the grazing resources. Cattle and horses use a different sort of range from sheep. Sheep relish tender, green foliage and the grains of many grasses, while cattle consume the coarse grass forage. Cattle prefer level or rolling country, and altitude makes little difference if the stock have been raised on the range. Sheep do best on smooth range and where the summers are cool. They can go from several days to several weeks without drinking, depending upon the abundance of succulent weed forage, the temperature, and the amount of rain and dew. Cattle need water oftener—at least every two days.

STUDY SHEEP ON WESTERN RANCH

Several results of importance to western sheepmen have been ascertained by experiments at the government sheep ranch near Dubois, Idaho, which has been in operation two years. Formerly it was customary for range sheep men to discard ewes which did not bear lambs when two years old. Extensive investigations by the department of agriculture have developed that such ewes are just as valuable for future breeding as those which bear lambs as two-year-olds.

Individual records are kept on the government sheep ranch relative to the weight of fleece, length of fleece, character of fleece, fineness of fiber, and mutton quality of each animal, while detailed account is maintained of the offspring of each ewe. The particular utility of the results obtained arises from the fact that the flock is handled just as are all similar bands of sheep in the hands of Wyoming stockmen.

Experiments are being conducted to develop a type of sheep more suitable to the western range conditions than the types now prevalent. It is hoped to extend this work in both mutton conformation and length and weight of fleece.

There are at present about 1500 head of pure-bred Rambouillets, Lincoln Rambouillets, Cotswold Rambouillets, Leicester Rambouillets, and Romney Rambouillets on the government ranch. Crossbreeding experiments are being conducted with all these breeds and crosses, as well as the use of pure-bred Corriedales, which have been mated with cross-bred ewes.

Sir Aaggie De Kol Acme 2nd, 221668

One of the most richly bred bulls of the Holstein-Freisian breed heads our herd

His Pedigree is an unbroken line of wonderful producing and transmitting dams and outstanding sires

HIS SIRE

SIR AAGGIE DE KOL ACME

Sired by a son of the former world's record cow Aralia De Kol, and out of the present world's strictly official yearly butter record cow Aaggie Acme of Riverside 2nd. Owned jointly by A. W. Morris & Sons, Woodland, and Fred W. Kiesel, Sacramento, in whose herds he is being given a large opportunity.

His Sire's Dam

AAGGIE ACME OF RIVERSIDE 2ND

Butter 1 year..... 1331.78
(World's record, strictly official.)
Milk 24690.00
Butter 1 year at 4 years..... 1095.10
Milk 19577.30
Butter 2 years..... 2426.88
Milk 44267.30

HIS DAM

ARALIA DE KOL 3D

Milk 24554.10
Butter 1 year at 2 years..... 772.93
Milk 17509.50
Butter 2 years..... 1973.40
Milk 42063.60

His Dam's Dam

ARALIA DE KOL

Butter 1 year at 11 years..... 1142.32
Milk 28090.00
(World's record when made.)
Butter 1 year at 12 years..... 950.69
Milk 22922.60
Butter 2 years..... 2093.01
Milk 51012.60

His Sire's Dam's Dam

AAGGIE ACME OF RIVERSIDE

Butter 1 year at 11 years..... 1053.14
Milk 20354.80
Butter 1 year at 6 years..... 808.82
Milk 15032.60
Butter 2 years..... 1861.96
Milk 35387.40

Consider This Tremendous Production

Five of the seven nearest dams of Sir Aaggie De Gol Acme 2nd have two yearly records each, the other two were never run on yearly test, and those two are Juliana De Kol, former world's record 2 year old in the 7 day division and she was junior champion at the St. Louis Exposition, and Aralia the dam of Aralia De Kol.

Five of the seven nearest dams of Sir Aaggie De Kol Acme 2nd have two yearly records

Butter 1 year..... 1154.00
(Highest in world for bull of service age.)
Milk 25055.80
Butter 2 years.....2089.65
(Highest in world for bull of service age.)
Milk 44748.70

The ten yearly records made by five of his seven nearest dams total 10448.26 lbs. butter and 223743.5 lbs. milk, an average for the ten records of 1044.82 lbs. butter and 22374.3 lbs. milk, average test 3.73 per cent, and these ten records include one 2 year old record, one 4 year old record, two 11 year old records, and one 12 year old record.

We believe that no bull in the world is the superior of Sir Aaggie De Kol Acme 2nd judging him from the volume of production of his nearest dams, their proven persistent production, their large milk flow with high per cent butter fat, the splendid individuality of all of his nearest ancestors, and best of all the unusually good individuality of the calves he himself is siring.

We shall have some of his young sons to offer, out of well bred, good record dams. Write now or come and see what we have on hand. This blood has made Holstein history already and is being used extensively in the best herds in the west, not forgetting the $11000.00 son of Sir Aaggie De Kol Acme now heading two of the best herds in New York.

A few approved cows will be accepted for the service of Sir Aaggie De Kol Acme 2nd. at a fee of $100

Eldorado Herd

Alex. Whaley, Owner **Tulare, Calif.**

Sir Pietertje Ormsby Mercedes 43d

SENIOR HERD SIRE

His sire: SIR PIETERTJE ORMSBY MERCEDES, the greatest sire of yearly record daughters of any breed. Twenty-two of his daughters, most of them under mature age, average over 1000 pounds butter in one year; three have records above 1300 pounds butter in one year; eight have records above 1000 pounds butter in one year; fourteen out of his 66 A. R. O. daughters have records above 30 pounds butter in seven days; two have records above 40 pounds butter in seven days.

In the Minnesota Breeders' sale last June three of his daughters sold for over $30,000 and one sold for $65,000.

Production and show ring records establish him as the breed's premier sire of producers and show ring winners.

His dam: AAGGIE WAYNE PEEP, one of the outstanding cows of the breed.

Butter one year	1,250.35 pounds	Butter seven days	34.59 pounds
Milk one year	27,762.50 pounds	Milk seven days	657.20 pounds

She has Produced in Four Years

Milk	88,509.70 pounds	Average per year Butter	999.85 pounds
Butter	3,999.43 pounds	Average per year Milk	22,127.40 pounds

She is a full sister to Early Dawn Peep 2d, 1287.72 pounds butter from 26,204.1 pounds milk in one year; and half sister, by the same sire, to Ona Clothilde Wayne, 1,266.65 pounds butter from 27,091.5 pounds milk in one year, and Jennie De Kol Veeman Wayne, 1,003.21 pounds butter from 20,876.3 pounds milk in one year.

Junior Herd Sires

SIR AAGGIE MEAD

Sire, Sir Aaggie De Kol Acme. Dam, Aralia De Kol Mead.

His dam and sire's dam each have strictly official yearly records above 1,200 pounds, averaging 1,273.49. pounds, which can be said of no other bull.

His dam, dam's dam, and his sire's dam average 1,229.76 pounds—a world's record average.

His three nearest dams each have produced over 2,000 pounds butter in two consecutive years, averaging over 2,200 pounds, which can be said of no other bull.

Five of his seven nearest dams average 1,177 pounds butter in one year—a world record average.

Five of his seven nearest dams average 2,112.14 pounds butter in two years—a world's record average.

You can't beat this long distance ancestry.

FINDERNE SOLDENE VALDESSA

Sire, King Valdessa. Dam, Finderne Soldene Hengerveld.

His sire is a son of the first 41 pound cow and a grandson of the first 44 pound cow.

His dam, a 35.34 pound three-year-old, (World's record for heifer with first calf), is a daughter of King Hengerveld Aaggie Fayne, one-third of whose daughters have exceeded the 30 pound mark, and who is a brother to the 50 pound cow Segis Fayne Johanna.

His dam is a sister to the World's champion yearly producers of the junior three-year-old and junior two-year-old classes. Also a three-quarters sister to a 1,075 pound three-year-old.

The Health of Our Herd is Under State Supervision

We have over 200 head, including cows with yearly records up to over 1,100 pounds butter, and daughters of large yearly record cows. Also 10 cows and heifers with records above 30 pounds butter in 7 days, and a large number with records from 25 to 29 pounds butter in 7 days.

Every Female in the Herd will be Given a 305 or 365 Day Record.

Visitors Cordially Invited to the Farm.

TOYON FARM ASSOCIATION

Farm: Los Altos, California **Office: Mills Bldg., San Francisco**

HOLSTEIN COMMENT

Continued from Page 258

dam has a record of 39.42 pounds of butter and 613.82 pounds of milk at 14 years of age, making the average for these three, 45.82 pounds of butter.

"The dam of this calf is Springdale Segis Fayne, who also traces directly to King Segis, the sire of the 50 pound cow, Segis Fayne Johanna. She has a seven day record at three years of 20.44 pounds butter, 497 pounds milk. Her dam has a record of 17.84 pounds butter, 445.6 pounds milk at three years. Her grand dams have records of 32.03 pounds butter, 675.8 pounds milk and 31.22 pounds butter; and her great grand dams have records of 31.46 pounds butter, 24.35 pounds butter and 33.2 pounds butter.

"The calf is a splendid individual of beautiful conformation and nicely marked, being about three-fourths white. He weighed over 100 pounds at birth and is a strong, big boned fellow with fine straight top lines."

HOLSTEIN ASSOCIATION TO SECURE A CENSUS

The Holstein-Friesian Association of America has taken a very important step in attempting to secure a census of the living registered cattle of this breed. If it is generally complied with, and there is no reason why every owner should not answer the inquiries, it will afford a fund of valuable information in addition to the mere enumeration of the cattle.

President Aitken stated, referring to this matter of a census, in his annual address:

"The knowledge that could be gained by an accurate census of the Holstein-Friesian animals would be of inestimable value to the association in hundreds of ways. It would teach us the longevity of the breed, their years of usefulness on an average, and the number that we might expect each year from nature's production.

"I think it would add largely to the value of Holstein-Friesian animals if we knew more about their history and about the number of years of usefulness we might expect from a Holstein-Friesian cow.

"State and Holstein clubs should cooperate in this census and would find it a point of vantage in their work to be able to point out to buyers the extent of the herds of their membership."

Reports from various parts of Arizona indicate the range country to be in excellent condition, with plenty of feed and water to carry stock through the fall and winter.

"CASTLEVIEW" PLAN SHOULD PUT "BERKSHIRES ON EVERY FARM"

By J. Francis O'Connor

"Berkshires on Every Farm" has long been the slogan of the American Berkshire Association and every progressive Berkshire breeder in America. The comparatively high cost of properly developing pure bred breeding stock has put the selling price slightly beyond the reach of the average farmer. Aside from price, there is the educational feature necessary to demonstrate to the present owners of ordinary hogs the great advantages of owning pure breds. It is quite true that the pure breds are slowly but surely replacing the common hog, and it appears that this work is being accomplished through the younger men, the boys. The boys pig clubs, bred sow clubs and similar organizations have done wonders during the last few years.

It seems logical therefore to shape any modern plan of introducing pure bred hogs on the ranch along the lines of interesting the boy. The fact that the ordinary boy on the ranch possesses little or no capital makes the "Castleview" plan feasible, though it works equally well with the small rancher. The plan in detail is as follows:

A suitable number of sow pigs are selected at weaning time and developed for breeders. When four or five months old, they are placed with high school boys or others and a contract covering the following points is drawn up.

Each boy agrees to take a pig and properly feed the same until breeding time, when the animal is returned to the breeder. The boy then takes the pig home and feeds it until farrowing time, when the breeder is notified to call and check up the litter. After the pigs are weaned, the following options are given the boy.

Accept the full ownership of sow and surrender the pigs to the breeder, or

Accept the litter of pigs and surrender the sow to the breeder, or

Accept one-half ownership of sow and keep one-half of the litter, or

Sell to breeder at price per pound previously agreed upon, the one-half interest in sow and pigs. This option is a provisional one in the event of the boy finding it necessary to change residence to some other county.

The above plan gives the boy or rancher an opportunity to secure pure breds without the payment of a dollar down. It is assumed that the boys selected have access to plenty of skim milk. This plan means more and better pigs for the breeder, as the best pigs of future litters can always be purchased at mutually satisfactory prices. If the boy makes good, the news soon spreads, with the result that the breeder feels an almost immediate demand for pure bred stock. The work of interesting the boys can easily be done through the agricultural teacher in the high school. If the breeder feels inclined to offer three prizes in the shape of medals for the boys making the best showing, better results can be obtained.

L. M. Harrison, the Arizona field agent of the bureau of crop estimates, states that crop conditions August 1 were better than at any time during the season. He estimates the wheat crop this season to be 1,120,000 bushels. The condition of various crops August 1, 1919, compared with August 1, 1918, is as follows: Cotton, 93 and 95 per cent; alfalfa, 94 and 88 per cent; pasture, 103 and 77 per cent; grain sorghums, 93 and 87 per cent; beans, 90 and 85 per cent; apples, 90 and 85 per cent; peaches, 90 and 75 per cent.

TRAINING THE BOYS

The Letterman General Hospital at San Francisco is filled with a great number of boys who went across and returned either wounded or incapacitated and are now getting a grip on themselves and being restored to normal physical condition. Where desired they may take a vocational training course and are aided in every way.

One of the features of the hospital is a hospital newspaper, "Listening Post," edited and managed by the disabled soldiers who are still in the hospital. An annual of this paper is soon to be published which will contain information as to the activities at the hospital, photographs of the grounds and buildings and a complete history of the hospital service. Copies of this special will be mailed to anyone if 25 cents is sent to "Listening Post," Letterman Hospital, San Francisco, California. The proceeds are all to go to the amusement of the soldiers.

Registered Holstein - Friesians
HEADED BY
Prince Gelsche Walker 11th 202257

His Sire: PRINCE GELSCHE WALKER, whose daughters have held more state and world's records than the daughters of any other sire yet developed in the west.
His Dam: MISS FILLED KORNDYKE, with official records of 29.67 lbs. butter from 615.1 lbs. milk in 7 days. As a 2 year old she made 563.14 lbs. butter from 12634.9 lbs. milk in one year. She is a daughter of Korndyke Queen De Kol's Prince, 90 A. R. O. daughters with records up to over 1090 lbs. butter in one year and over 35 lbs. in 7 days.
PRINCE GELSCHE WALKER 11TH is full brother to Miss Gelsche Walker Korndyke, whose record of 23.17 lbs. butter in 7 days as a junior 2 year old was a California record in class when made. He is getting some extra fine calves, nicely marked, and good straight individuals.

I offer two of his young sons, 6 and 7 months old, out of dams with 20 and 23 pound 3 year old official records. They are good ones and priced right.

The World's Greatest Dairy Production Backs Our Two Herd Bulls

Prince Alcartra Korndyke

His Sire: KORNDYKE QUEEN DE KOL'S PRINCE, who has 90 A. R. O. daughters with records up to over 1090 lbs. butter in one year and over 35 lbs. in 7 days. His sons and daughters have transmitted notable production and a uniformity of type not excelled in any family of the breed.

HIS DAM--

Tilly Alcartra

Butter 6 years	6141.36 lbs.
Milk	156776.10 lbs.
Butter 1 year	1322.25 lbs.
Milk	33424.80 lbs.
(World's record.)	
Butter 7 days	40.78 lbs.
Milk	783.70 lbs.
Her records for six consecutive years average:	
Butter	1023.56 lbs.
Milk	26129.30 lbs.

She is the only 40 pound cow that has made over 1300 lbs. butter in one year; the only cow that has made over 33000 lbs. milk in one year, over 63000 lbs. milk in two years, over 94000 lbs. milk in three years, over 120000 lbs. milk in 4 years, over 156000 lbs. milk in 6 years; the only cow that has made over 1100 lbs. butter in one year three times; the only cow that has made over 1000 lbs. butter in one year four times; the only cow that averages over 1000 lbs. butter per year for six years; the greatest winner of association prize money.

Her yearling daughter, the only one ever offered for sale, sold for $11200.00 at Philadelphia in June, being exceeded in price by only one female, a world's record cow.

PRINCE ALCARTRA KORNDYKE is transmitting the production of his great dam in a marked degree. Only five of his daughters have completed yearly tests so far, and these five at an average age of 2 years 5 months average:

Butter one year	668.47 lbs.
Milk	15245.40 lbs.

Two of his daughters, freshening as senior 4 year olds, made 31.16 and 30.39 lbs. butter respectively in 7 days, and are both going at a rate on yearly test that promises to carry them right around the 1000 lb. mark. We have around 75 of his daughters in the herd at present, all of which will be put on test.

Winnie Korndyke DeKol Alcartra

His Sire: PRINCE ALCARTRA KORNDYKE, our senior herd sire, whose dam is Tilly Alcartra, the world's greatest dairy cow. Note the tremendous records behind him (shown on this page) and the splendid records his daughters are making.

HIS DAM--

Winnie Korndyke Cornucopia De Kol

Butter one year (California record when made)	1201.06 lbs.
Milk	31034.20 lbs.
Butter seven days	28.73 lbs.
Milk	789.00 lbs.

She is by Aaggie Cornucopia Johanna Lad, 106 A. R. O. daughters, whose dam was the great foundation cow Aaggie Cornucopia Pauline, whose records of 34.32 lbs. butter in 7 days and 137.62 lbs. in 30 days as a senior 4 year old stood as world's records for eight years. Her dam is a daughter of Korndyke Queen De Kol's Prince, that sterling sire of producers and good individuals.

The dam and sire's dam of WINNIE KORNDYKE DE KOL ALCARTRA have the great average of:

Butter one year	1266.55 lbs.
Milk	32229.50 lbs.
(Highest in world)	

The records of his sire's dam, his dam, and her sire's dam average:

Butter 30 days	2997.00 lbs.
Milk	2997.00 lbs.
Butter seven days	34.61 lbs.
Milk	743.90 lbs.

WINNIE KORNDYKE DE KOL ALCARTRA is a strong, vigorous individual of good type and quality, and we believe he is certain to hand down the tremendous dairy production which he inherits on both sides of his pedigree. His first calves will soon be coming, and he will be bred to a long list of highly bred cows and heifers in our herd.

Bulls to Head Any Herd

We have on hand a number of bulls good enough to head registered herds and the very best herds of grade cows. They are growthy, vigorous, and good individuals. Write us your needs—we may have just the bull you want for your herd.

We Stand Squarely Behind Every Animal We Sell.

Williams, Colusa County, California

Grains for Forage

IN the issue of August 2 we gave illustrations and a few facts regarding better grains for forage and silage. The illustrations and the facts were obtained from a test plot on a city block in Los Angeles with hard clay soil and with irrigation. H. L. Musser now gives report of the behavior of these plants up to the end of July. Most of the planting was done early in April and Mr. Musser's report shows results three or four months after planting.

One point we do not understand as given by Mr. Musser in the second paragraph: "Indian corn and millet are slightly hardier than sorghums." The greater hardiness of Indian corn, at least, has been questioned in the past, for sorghums had the reputation of standing all kinds of grief and still recuperating when moister days came back.

Mr. Musser's report follows:

Demonstration of millets, grasses and sorghums planted first week in April in red clay soil.

1. The sorghums, saccharine and non-saccharine suffered because of cool nights and foggy mornings during April which resulted in their going to seed prematurely and before the proper growth was attained.

2. Indian corn and millet are slightly hardier than sorghums.

3. All trials showed the effect of uneven irrigation due to the fact that red clay soil does not subirrigate readily.

4. It was found necessary to use a sprinkler as irrigating by a furrow midway between rows was not sufficient.

Irrigation alone will not suffice; cultivation is essential.

6. To germinate fine grass seeds in heavy clay soil it is necessary to prepare the soil to a proper fall of four inches to 100 feet. Corrugate it using four inch by four inch pieces with which to make furrows 20 inches apart for irrigating. Then keep the water flowing through the furrows continuously or at least sufficiently to keep the surface perpetually moist until the seed has germinated and the plant is well established. This seems excessive labor, but it is economy to follow closely this method on clay or adobe soil.

7. Common hog millet matured seed in 64 days and a second crop in 90 days and continuously thereafter throughout the summer. This variety is similar to Russian red millet with loose heads and branching stalks.

8. Japanese, brown top and Indian millets are similar in habit of upright growth, abundance of succulent foliage and numerous stools seeding freely. Indian millet exceeds in tonnage grain and forage. Japanese variety matures seed two weeks earlier.

Penciliaria or Pearl millet is taller, has coarser foliage and stools freely, the seed has little value. The forage would be better silage than fed dry.

9. One Napier joint planted April 3 was cut July 10. It had grown to a height of eight feet, had 61 stools, in thickness from the size of a lead pencil to three-fourths inch in diameter and weighed 14 pounds. The entire plot showed remarkable growth and in August it was well above ten feet tall and every clump more than 12 inches in diameter. The foliage and stems are tender and succulent at this writing, August 1. Because of the low germination of the seed and fineness of it, it is impractical to grow it from seed. One plant in one year may produce 1500 to 2000 joints and plants. Freezing weather destroys the foliage but not the crown.

10. The Wonder Forage Plant is something entirely new, presumably a cross pollination between Sudan grass and Black Amber cane. Its growth was unchecked by the cold weather in April as was the growth of the sorghums. It was planted April 3 and at this writing many plants are 12 feet tall, having from 20 to 75 stools, seeding freely. The crowns at the base are ten to 14 inches in diameter. Foliage is narrow and more succulent than that of sorghums. The stems are not as thick and coarse, it will yield probably twice as much silage as any sorghum and may be cut twice a season. It seeds freely and grows, if irrigated, readily from seed.

11. Guinea grass promises to produce an A-1 crop of coarse grass with numerous spreading seed panicles. It is greatly valued in the Gulf states and Mexico because it affords an abundance of forage during the winter months and endures pasturage to a wonderful degree.

12. Smilo (Oryzopsis miliacea), the grass for the desert range of the Southwest. The seed is slow to germinate. The introducer, Mr. Stead of San Diego, advises sowing the seed broadcast just before the rainy season sets in and then forget all about it. In the spring you will be surprised at the growth you will find. It stools and seeds freely.

13. Rhodes grass (Chloris Virgata). This plot demonstrates that Rhodes grass is a wonderful grass for pasture. Mr. Renfrew, manager of the Beatty and Renfrew Rhodes Grass Ranch at Niland, where they have growing 320 acres of Rhodes grass, is authority for the statement that one acre will pasture 25 to 30 hogs, seven cuttings of hay of 1½ tons per cutting in one year. It is perennial where the thermometer does not range below 18 degrees. When frosted the field turns brown but the grass is as good roughage as so much cured hay. This is important to know because one may feed all the tender crops, saving the Rhodes for winter pasture. Space is too limited to state all its merits.

14. Teff grass (Eragrostis Abyssivica), an annual, grows readily from seed and may be pastured in one month or cut for hay two months from the time of planting. It stools and seeds freely, may be cut three times a season or pastured all summer with ordinary irrigation.

15. Fog grass. We wish to call the attention of visitors to the trial of Fog grass, planted June 1. It has grown blades 30 inches long. These blades stand 13 inches high and droop on all sides until the tops nearly touch the ground and, at this date, August 1, no sign of seed. In the early morning the entire plant is a mass of dewdrops, so far in excess of other grasses that the name of fog is at once suggested. It is velvety to the touch, much more so than any other grass on the plot.

NOVEL FEATURE AT DAIRY CATTLE CONGRESS

An original feature and one which is thought will add greatly to the educational value of the Dairy Cattle Congress to be held at Waterloo, Iowa, September 22-28 is an "official information man" for each the Holstein, Jersey, Guernsey and Ayrshire breeds. A special man for each breed will be stationed in the cattle pavilion for the purpose of explaining in a brief way the characteristics and advantages of the particular breed he has in charge.

Thousands of city and town people, who know little or nothing of the great importance of the dairy industry nor are even able to distinguish the various breeds, attend such shows. The management of the Dairy Cattle Congress believes that the majority of these people will appreciate the voluntary information offered and that a keener interest will be aroused in dairying as a result. Technicalities will be eliminated by the men when talking to such people, and only the elementary principles of dairying and the vital part that dairy products play in the human ration briefly explained.

LOS ANGELES PREMIUM LIST

Secretary C. R. Thomas of the Los Angeles Live Stock Show is mailing out premium list rules and regulations of the second annual which is to be held at Exposition Park, Los Angeles, October 18-26. It is a beautifully printed booklet with its title cover in raised gold letters. Mr. Thomas says this is to be the greatest live stock show yet held on the Pacific Coast. The cash premiums aggregate $34,000, with an additional $20,000 for prize racing program.

Sir Aaggie Korndyke Alcartra

194050

Heads Our Herd

His Sire—PRINCE ALCARTRA KORNDYKE, son of Tilly Alcartra, the world's greatest dairy cow, and Korndyke Queen De Kol's Prince, who has 90 A. R. O. daughters with records up to over 1090 lbs. butter in one year and over 35 lbs. in 7 days. The first five 2 year old daughters of Prince Alcartra Korndyke to complete yearly records average 668.47 lbs. butter from 15245.4 lbs. milk at an average age of 2 years 5 months. Two of his daughters made 31.16 and 30.39 lbs. butter respectively in 7 days as senior 4 year olds and are both going at a 1000 lb. rate on yearly test.

His Dam—HAZEL AAGGIE OF OAKWOOD DAUGHTER, a granddaughter of the famous imported bull Jetze Zwarthak, who was a show bull of great merit and a sire of big producers. She made 860.91 lbs. butter from 21208.5 lbs. milk in one year as a junior 3 year old, and has a daughter, full sister to Sir Aaggie Korndyke Alcartra, that made 636.52 lbs. butter from 14392.4 lbs. milk in one year, freshening at 2 years 4 months.

The Dam and Sires' Dam of Sir Aaggie Korndyke Alcartra average:
Butter one year----1096.58 pounds
Milk one year----27316.60 pounds

His calves now coming on in our herd are all nice straight individuals, showing good constitution and excellent type. One of his sons will introduce the world's greatest producing dairy blood into your herd.

Leeman & Kilgore

Ripon, California

Sturgeon Stock Farm
HOLSTEINS

Headed by SEGIS PONTIAC ABBEKERK

His sire: SEGIS PONTIAC DE KOL BURKE, son of the former world's record cow Riverside Sadie De Kol Burke, who made 902.1 lbs. milk and 32.29 lbs. butter in 7 days, and in one year made 28,826.4 lbs. milk and 1085.12 lbs. butter.

Segis Pontiac De Kol Burke now has 21 A. R. O. daughters, one of them with 932.44 lbs. butter in one year as a senior 2 year old, another with 851.01 lbs. butter in one year as a junior 2 year old, both California records in class. Another daughter recently made 26.18 lbs. butter in 7 days as a junior 2 year old, and promises to make a very large yearly record.

A daughter of Segis Pontiac De Kol Burke sold for $11,200.00 at Philadelphia in June, and in the same sale a son of one of his daughters sold for $11,000.00, they being the second highest priced female and male respectively in a sale composed of picked tops from fifty of the best herds in the United States and Canada.

His dam: CHANGELING TIDY ABBEKERK GEM. As a 4 year old she made 767.36 lbs. butter from 19,389.9 lbs. milk in one year. As a 5 year old she made 34.74 lbs. butter from 501.2 lbs. milk in 7 days, and the following year made 35.07 lbs. butter from 639 lbs. milk in 7 days. She is the only 35 lb. cow in California with a record above 34 lbs. at a previous freshening. She is a daughter of the century sire Changeling Butter Boy and is out of a 31 lb. daughter of Tidy Abbekerk Prince.

SEGIS PONTIAC ABBEKERK as an individual speaks for himself, and the wonderful production of his nearest relatives justly entitles him to be rated as one of the best of the younger sires of the breed. He is being mated with a large number of highly bred cows and heifers in our herd and we now have some of his young sons to offer.

Prince Riverside Walker

His Sire: PRINCE GELSCHE WALKER, whose daughters have held more world's records and state records than the daughters of any other bull yet developed on the Pacific Coast, and have averaged higher in the sales ring than a like number of daughters of any other bull in the west.

His Dam

Aaggie Acme of Riverside

Butter two years ..... 1861.98 lbs.
Milk ..... 35387.40 lbs.
Butter one year ..... 1053.14 lbs.
Milk ..... 20354.80 lbs.
Butter seven days ..... 28.35 lbs.
Milk ..... 558.10 lbs.

Dam of AAGGIE ACME OF RIVERSIDE 2ND—

Butter two years ..... 2426.88 lbs.
Milk ..... 44267.30 lbs.
Butter one years ..... 1331.78 lbs.
(World's record strictly official)
Milk one year ..... 24690.00 lbs.
Butter seven days ..... 35.68 lbs.
Milk ..... 627.30 lbs.

And she is dam of MISS AAGGIE ACME BURKE—

Butter seven days at two years 26.18 lbs.
Butter 30 days at two years..... 106.53 lbs.

This heifer has now been on yearly test for over five months and is milking over 80 lbs. per day, promising to make right around 1000 lbs. butter this year.

King Korndyke Pontiac 20th

His Sire: KING KORNDYKE PONTIAC, who is by the foremost A. R. O. sire of the breed, King of the Pontiacs, who has 32 two year old daughters that averaged 769.01 lbs. butter in one year. The dam of King Korndyke Pontiac is a three-quarter sister to Prince Gelsche Walker.

His Dam

Miss Valley Mead De Kol Walker

Butter 342 days at 3 years 5 months.. 1113.57
(Second highest in class when made)
Milk 22021.10
Butter 7 days 8 months after calving 25.14
(World's record in class)
Butter 7 days at 3 years 5 months... 36.80
Milk 688.60
Butter 257 days at 2 years 6 months... 790.37
Milk 17010.90
Butter 7 days 8 months after calving 21.33
(World's record in class when made)
Butter 7 days 2 years 6 months..... 25.68
Milk 534.00

She was unable to finish a full year either as a two or three year old having been bred early both years and milking both years right up close to calving, yet her production for the two short years is:

Butter ..... 1903.95 lbs.
Milk ..... 38986.70 lbs.

She won the California Dairy Cow Competition over all ages and breeds and on her breeding, type, and production is widely rated as one of the greatest heifers ever developed in the Holstein-Friesian breed.

These two exceptional bulls are being mated with highly bred, heavy producing females in our herd. Here are some of the records made by our cows and heifers during the past year:

Name of Animal:	Seven-day Test. Butter.	Milk.	Thirty-day Test Butter.	Milk.
Coloma Beauty Butter Maid, Jr. 4 years	34.77	575	121.82	2566.8

Yearly Records.				
Hertinga Willis, 8 years			103	23,960
Coloma Beauty Butter Maid, Jr. 3 years			875	20,239
Madrigal Mooike 2d, Jr. 2 years			755.95	20,160

We are putting other cows and heifers on test regularly as they freshen, and besides the above list we have a large number of females in our herd with records up to over 30 lbs. butter in 7 days.

Bulls rarely reach service age on our farm, so large is the demand for sons of our herd sires. If you want a young bull of good individuality and the very best of breeding, come and see the herd or write your needs.

Our Entire Herd Is Tuberculin Tested

Tulare Holstein Farm

W. J. Higdon, Owner, Tulare Calif. Harry L. Redd, Herdsman

DETAILED ESTIMATES EACH MONTH

Up to this time the United States department of agriculture has issued a single estimate in January of each year, showing how many head of the various kinds of live stock there are in the United States, and one estimate a year showing losses by disease. Now the whole system is to be changed. As soon as the machinery can be got in operation by the bureau of crop estimates there will be 12 live stock estimates a year instead of one. Instead of being made for the 48 states they will be made for the 3000 agricultural counties in the United States. Instead of showing merely that there are so many horses, so many cattle, so many sheep, and so on, they will be made by age and sex classifications. That is, they will show what proportion is breeding stock, what proportion growing stock, and what proportion "marketable stuff." They will show quality as well as numbers—the proportion of pure-bred animals, of grade animals, and of scrubs.

A great deal more than that, even, is to be done under the new system. These surveys will show, besides actual live stock figures, a great many things pertaining to the live stock industry. They will show how many silos there are and what they contain, how much feed is on hand and in prospect, available for feeding to live stock; and the condition of pastures and ranges throughout the United States. This showing will be made every month in the year.

GRAND CHAMPION HAMPSHIRES

Popularly known as the Grand Champion Herd of Hampshires is that owned by Gordon & Langdon at Perris, F. A. Langdon, manager. The grand champion sow Sioux Queen, of P. P. I. E. fame, gave name to the herd. The blood of this famous brood and show sow is strong in the herd today as well as in the numerous offshoots from the herd in various parts of the country. However, one of the strong features of the herd is in the diversity of blood lines it embraces. One of the fine sires in service at this time is Honest Lad. His sire California Lad is now doing service in the Dupee herd at Santee. His dam is the great brood sow Cleopatra, a daughter of Gen. Tipton Again and Sioux Queen. The well known big boar Goldmine is still in use for the older sows in the herd. Prince is a yearling son of Gen. Tipton Again, and out of Sioux Queen. The sows in herd are close up descendants of Goldmine, Mose Messenger, Pat Maloy, Cherokee Plummer, Gen. Tipton, Gen. Allen's Masterpiece, California Lad, Blythedale Jim and Distributor. The herd is in fine thrift, is a real producer of good things, and sales are reported to have been good. Mr. Langdon will have some good "pen holders" out at the fairs, though he makes no pretense at being a professional showman. He invites inspection every day in the year. Two hundred pigs are in evidence, and plenty of prospects ahead.

FARM MANAGEMENT

"Farm Management," by Jacob H. Arnold of the office of farm management, United States department of agriculture, published by the Macmillan Company, New York, at $1.25.

"It has been only in recent years that much attention has been given to the study of farm management. However, from the standpoint of practical farming it is probably the most important phase of agricultural study. The subject being new, it is somewhat difficult to present in as logical and clear a manner as may be done when presenting other phases of agricultural science to which more attention has been given."

This is Mr. Arnold's first statement in the prefatory note. He then proceeds to discuss: What a Farm Is; Types of Farms; Advantages of Situation; Farm Crop Problems; Live Stock; Farm Organization; Efficiency of Organization; Business Methods Applied to Farming; Farm Administration; etc. It is a book of nearly 250 pages admirably demonstrating that the handling of a modern day farm means modern day business methods.

King of the Black & Whites

Has 45 A. R. O. daughters, the largest number of any bull on the Pacific Coast.

One of his daughters at the Philadelphia Sale sold for $2,000.00, and her heifer calf sold for $2,100.00.

Another daughter, as a junior 2-year-old, has just completed a record of over 20000 pounds milk and over 800 pounds butter. This is excelled by only two daughters of the great bull King of the Pontiacs, at the same age.

KING OF THE BLACK & WHITES' daughters are ranking among the foremost, both in production and type. R. E. Haeger of Illinois has one in his famous show herd which has won prizes for him in all the big shows.

Asa Morris, of Woodland, in describing Prince Gelsche Walker, characterized him by saying that he was second only in breeding to KING OF THE BLACK & WHITES.

He was the first bull of the breed whose seven nearest dams averaged over 30 pounds of butter in 7 days, six of his seven nearest dams being 30-pound cows, four of which have produced 30-pound daughters who in turn have produced 30-pound daughters, all of which have 30-day records above 126 pounds of butter.

He is noted for his prepotency and the persistent milk production of his offspring. He already has one daughter above 30 pounds butter in 7 days, and the first daughter to be tested sired by his son King Lillian Walker Segis, made over 17 pounds butter in 7 days as a 2-year-old.

A son of **KING OF THE BLACK & WHITES,** out of a good record dam in our herd, will breed improved production into any herd.

HENDERSON COMPANY

716½ K Street **Sacramento, Calif.**

OUR HERD NOW CONTAINS 333 REGISTERED HOLSTEINS

IT WILL PAY

The Breeder or Dairyman who is trying to get a higher percentage of butter-fat in milk to investigate

Supreme Glista Pietje

KING OF HIGH TESTERS

His dam, her full sister and seven nearest dams have an average test of 4.5%

His dam, GLISTA EGLANTINE, has two 32 pound 7 day records and her sister, Glista Ernestine, has recently completed her fifth consecutive record of over 30 pounds of butter in 7 days. This wonderful performance has been equalled by only one other cow in the United States.

BONITA HERD is composed of young, high-testing individuals with A.R.O. records ranging from 18 pounds of butter in 7 days at 2 years old to 27 pounds of butter in 7 days at four years old.

You will find that a son of SUPREME GLISTA PIETJE, from one of these A.R.O. cows, will be a valuable addition to your herd.

To induce the more extensive use of pure bred sires, we will give very liberal terms on young bulls.

Economic Status of the Jersey Cow

By Dr. H. W. Hand, President California State Jersey Breeders' Association.

THE Jersey cow is an important factor in the development of any state, especially a state like California where her fitness is becoming more appreciated every year. Because of our climate and our soil and the cultural tastes of our people, California is fast becoming the home of the small rancher. Our great landed estates are rapidly being subdivided. The great dry farm era is passing, to give place to irrigation with its accompanying phases of agricultural and horticultural evolution.

In California all our natural conditions of soil, climate and environment conspire to impell the average citizen "back to the soil." There is nothing that so strongly appeals to the average city man, who has toiled for others for years, who is tired of the daily grind, and whose family probably needs the freedom of the country, than a small, intensely cultivated ranch in some quiet country side, with its abundance of fresh eggs and poultry, its fresh and health-giving milk and butter and its beautiful and interesting live stock.

There is no animal that takes so kindly to small quarters as the Jersey cow. She enjoys the frequent visits of her keeper. She loves to grace, with all her beauty, the farmyard or the lawn, and the more we pet her the more rich product will she give in return. She prefers the small paddock to the large pasture and yields correspondingly greater profits for the lesser investment. And when the people of the larger cities get to the point in their education where they will demand that the value of milk be based on the nutritive value it contains, that its selling price shall vary according to the butter fat it contains, then the Jersey will have truly come to her own for her milk contains an average higher percentage of fat, nutritive solids other than fat and essential vitamines than the milk of any other breed.

There is no animal that returns a greater profit to her owner or contributes more to the health and happiness of the family. There is no food that is so cheap to consume nor is there any food that so surely insures fine growth and development of children as milk. All the great French scientists agreed early in the world war that to feed the front trench soldiers with a cup of good wholesome milk, stimulated the boys to the highest and best action. It may therefore be truly said that milk, and not beer, won the war. There are many substantial and sound economic reasons for the coming supremacy of the Jersey cow.

At the state fair last year the Jerseys on exhibit outnumbered any other breed. The California State Jersey Breeders' Association is buoyant over the fact that the breed is growing in both numbers and popularity each succeeding year. More people visit the Jersey exhibits at the fairs and evince greater enthusiasm than was ever dreamed of by the officers of this breed association. More and more sales to new Jersey breeders are recorded every year.

The history of the Jersey breeding business in California and the West is indeed unique. Most of the men engaged in the Jersey business are men who have made all they have from the Jersey herself. When a breeder once learns the merits of the registered Jersey he never goes back to another breed. Universally, they become convinced that she is the most efficient machine in the dairy business today because she can manufacture more milk and butterfat out of less feed than any other machine in existence.

In one single county on the Pacific Coast there are 47 independent herds of registered Jerseys. At Orland, scarcely any other breed can be found. The whole community is like a little Island of Jersey. There are many strong, active Jersey associations springing up all over the Pacific states.

At the world's fair in Chicago in 1893 a great test was made of all the dairy breeds. The Jerseys demonstrated their ability to return a greater net profit than any other breed. At the world's exposition test at St. Louis in 1904 the Jersey produced one pound of butter fat for every 12 pounds of food consumed, while the Holstein required 14.83 pounds, the Shorthorn 15.52 pounds and the Brown Swiss 16.91 pounds. In the great Ohio test, conducted by the Ohio University, extending over a period of one year, 131 Jerseys and 157 cows of another dairy breed were tested. The results of this test were: Jerseys consumed 18.2 per cent more nutrients and produced 1.2 per cent more milk, 25 per cent more solids and 59 per cent more fat than the other breed. See official report.

Why shouldn't every Jersey breeder wear that complacent smile that won't rub off?

I am glad to note that more and more of our Jersey breeders are conducting yearly authenticated tests in their herds. This is very commendable in all breeds. Several breeders carry no other females in their breeding herds than such dams as have proven their real ability to produce by the register of merit test. This record making greatly assists the prospective buyer in the selection of the best and the proven ones. He does not have to depend on the pedigree solely nor on the statements of the breeder, for it is an easy matter to look up the records for himself. In this way he is not only able to trace the merits of the animal he wishes to buy, but its ancestry for several generations, if it be a good one. This record making is proving of inestimable value to all beginners when purchasing foundation stock.

The persistent and consistent efforts of the best breeders of the West are now being recognized. Some of the greatest breeders of the East are taking back with them some of the choicest animals of the Western families. The world's record Jersey cow Viva La France was bred, reared and developed by an Oregon man on Oregon grown feed and she still lives within 40 leagues of the Western Coast. The herd of Jerseys holding the world's record for herd production was reared and received its sustenance within 60 miles of the Pacific. When we stop to think, and do finally realize the blessings of our gentle, salubrious climate, our wonderful fields of alfalfa and vetch, and the superior richness of our grains in the essential nutrients that make beautiful animals and abundant butterfat, we feel quite confident that with continued, intelligent breeding, feeding and handling of the wonderfully efficient Jersey that we can make the Pacific states the dairyland of the world. The time is not far distant when our superior natural advantages for the production of fine animals will become more broadly recognized, and this region will go over the top for quality, type and production, the ideal and desired goal of us all. Henceforth, let us "Keep on a keepin' on."

Let us "Keep on making them better."

SOME CHEESE

If you don't believe it here are the facts, for it is the largest cheese in the world: weight 31,964 pounds, height eight feet, diameter 10½ feet, circumference 33 feet, value $16,000, weight of container 8000 pounds, milk used 357,500 pounds, salt used 800 pounds, rennet used 1251 ounces, three bandage cloths used, valued at $260, each measuring 33 feet long and 16 feet wide, factories furnishing the curds 59, made by 73 cheese makers and helpers, value of cheese factories, about $400,000, milk taken from 12,000 cows on 1800 farms.

This cheese, larger than any ever attempted before, was made to be exhibited by Armour and Company at the National Dairy Show to be held at the International Amphitehater, Chicago, October 6 to 12, 1919.

The community stock sale of the Grass Valley, Nevada County, farm bureau, which was to have been held the first of September, has now been postponed to the last of the month.

HEAVY PRODUCTION

The Result of Right Breeding

The real test of a bull is the performance of his daughters.

Senior Herd Bull

KING PONTIAC
Netherland Segis 3d

Thirty of his daughters are now in our herd and all will be officially tested.

As the test of any bull is the ability of his daughters to show heavy production, **King Pontiac Netherland Segis 3rd**, our senior herd bull, has proven his ability to transmit to his daughters heavy production. Three of his daughters as Junior two-year-olds have made better than 21 pounds butter in seven days, and seven more now on test promise equally as well.

Dam Senior Herd Bull

GERBEN ABBEKERK MAID

A twice 34 pound cow sired by Sir Skylark Ormsby Hengerveld, who has 27 A. R. O. daughters.

You cannot fail to be impressed with the wonderful breeding ability of our senior herd bull, and the tremendous combination of individuality and breeding represented in his sons. With this in mind you are certainly convinced that your herd bull should come from **Rosamaines Ranch.**

Come to the ranch and select one of his sons from one of our high producing cows.

All inquiries answered promptly.

Rosamaines Ranch

STALDER BROS., Owners Riverside, Calif.

June Acres Stock Farm

Do You Realize?

Holsteins

1. That our herd sire is one of the best bred bulls of the breed?
2. That five of his seven nearest dams average 1096.28 lbs. butter in a year?
3. That five of his seven nearest dams average 30.89 lbs. butter in seven days?
4. That ten of his nearest 14 ancestors, old enough to have daughters to finish a lactation period, have produced 1000 pound daughters?
5. That June Acres is the place to get high producing Holsteins?

Durocs

1. That June Acres Stock Farm won the Futurity in 1917 and again in 1918?
2. That in 1918 June Acres won almost twice as much money as any other exhibitor at the State Fair?
3. That the tops of these winners constitute our breeding herd?
4. That every animal in our herd is either a winner or has produced a winner?
5. That June Acres is the place to buy real good Durocs?

V. F. Dolcini

DAVIS, CALIF.

Santa Anita Rancho

Anoakia Breeding Farm

Registered Holstein Cattle

The herd is headed by PRINCE WALKER CORNUCOPIA, the highest record son of Prince Gelsche Walker. Prince Gelsche Walker justly ranks as the greatest Holstein sire yet developed on the Pacific Coast. His daughters have broken more state and world's records than those of any other Pacific Coast sire, and have proved themselves producers and breeders of the first rank. In public sales in California, seven sons, seven daughters, four grandsons, and five granddaughters of Prince Gelsche Walker, have sold for a total of $28,670.00 or an average of $1246.00 per head for the twenty-three head, an average not closely approached by a like number of descendants of any other bull in the west.

Prince Walker Cornucopia

The dam of PRINCE WALKER CORNUCOPIA is Alba Sadie Cornucopia Creetia, the only cow in California with a record above 36 lbs. butter in 7 days having a previous record above 34 lbs. butter in 7 days. She also has a record of 866.28 lbs. butter from 18,849.4 lbs. milk in 338 days. She is sired by Sir Sadie Cornucopia, whose dam was the first cow to make over 30 lbs. butter in 7 days, Sadie Vale Concordia, and she is the dam of the 40 pound cow Sadie Vale Concordia 4th, who is the dam of one 38 pound daughter, and the great sire King Korndyke Sadie Vale who has also sired a 40 pound daughter.

Among the females in our breeding herd are twenty-three daughters of Prince Gelsche Walker, some of them just now coming into milk; a large number of good record cows and heifers of substantial breeding; and a choice lot of granddaughters of Winnie Korndyke Cornucopia De Kol, the first cow in California to make over 1200 lbs. butter in one year.

We are blending and developing the blood lines that have produced some of the greatest animals of the breed, and offer a number of young bulls that should work improvement in your herd.

Registered Poland-China Swine

Our swine breeding is now confined exclusively to one breed—Poland-Chinas—and the herd is composed of over one thousand head of registered individuals of this breed. A very large number of the females are daughters of BANKER'S BOY, the $1000.00 Junior Champion at Panama-Pacific Exposition. He has proved himself one of the great sires of the breed, and his daughters are being bred to ANOAKIA CHIEF, son of the prize winning boar I B A Wonder. Steady demand for breeding animals has kept the herd sold down close, and intending purchasers will do well to communicate with us well in advance of the time delivery is wanted.

Registered Percheron Horses

The Percherons at Santa Anita were selected with strict regard to quality, and the type to meet California demand. Our stallions and mares have been prominent and consistent prize winners wherever shown, and we are now in position to offer a few very desirable young stallions at attractive prices.

Registered Mammoth Jacks

The foundation of this herd was laid with big, broody jennets, and headed by the best jacks that money could buy. We now have for sale a number of two and three year old jacks of exceptional breeding and quality.

Arabian Thoroughbreds

Out of our choicest Thoroughbred mares, and sired by our famous imported Arabian stallion, Ibn Mahruss, we are offering some splendid two year olds. Also some especially desirable young saddle stock sired by Ibn Mahruss, world renowned Arabian desert stallion, and by Don Castano, five gaited saddle stallion, winner in many prominent shows.

Making a Start With Pure Breds

By Frank B. Anderson

WHEN people ask me for advice about going into the hog business I do not begin by telling them that I started with less than $800 worth of hogs two years and a half ago, sold about $5500 worth in that time and now have a herd easily worth more than $5000. I usually start out by telling them the hard-work side of farming, the money it takes and the long hours with little time for pleasure during the period necessary to become established. I sometimes do not get as far as telling about the returns. Often the embryo hog man gets another notion into his head when I first relate the hard work attached to getting a farm started. Mine, however, was a case of pioneering as I took virgin land in a densely overgrown section of a reclamation district, so perhaps my lot was a little more severe than the average and maybe I should not assume that every beginner will have the difficult task I had to develop a breeding farm.

However, as the readers of this paper for the most part are either farmers or city people owning land or farms, they will be more interested in the live stock story, as sought by the Cultivator.

I first equipped my place for hogs, having already made up my mind to enter the pure bred Berkshire business. I bought six registered sows at the Western Berkshire Congress sale at Davis in February, 1917. One of these proved barren, so the breeder consigning her gave me a good herd boar in her place. My initial purchases were $560. Since then I have bought a couple of hundred dollars worth of pigs, but my entire cash expenditure for foundation stock, including transportation charges, came under $800.

Being a beginner, I had a little hard siedding when it came to getting the prices I thought I should receive for the first crop of pigs. I put a fair price on them, and what boar pigs I could not sell I turned into barrows and sent to the pork market. Sows I did not offer for sale until after a year or so, as I kept these to make up a larger herd.

I was therefore not much in shape to sell many pigs until the current year. I have, however, sold about $5500 worth of breeding and pork hogs, and my herd as it stands today would bring considerably better than $5000 in a public sale, so I would feel that others similarly situated could assume from this that the pure bred hog business, if given one's real earnest attention, can be made a good business.

My receipts would perhaps be greater and my herd larger had I had better success with my sows, some of which did not breed regularly, and had I not had a bad attack of pneumonia among my fall pig crop last winter, but these are all some of the hazards of the live stock business. The live stock business cannot be figured out with pencil and paper and made come up to the mark. It takes hard work and lots of it and constant attention, but I know no other branch of farming which is as fascinating as the growing of pure bred live stock, and it will pay well if given the right sort of attention.

As an appended story I might mention the purchase of a pure bred Holstein cow for $200 in the A. W. Morris & Sons sale at Woodland last November. I was offered $500 for her heifer calf before it was dropped, as the cow, which had a nice record, had been bred to King Mead of Riverside. On April 2 a heifer calf was dropped, but I declined the offer. Frank Morris told me recently that a three-quarter sister of this heifer made 1215 pounds of butter in a year's strictly official test, so this heifer is going to stay in my small dairy herd as a foundation animal, because this kind is not purchasable, and when one does change hands it is usually at around four figures. The dam will pay for herself in milk alone this year and is bred back to King Sadie Vale Elzevere, another great sire of the breed.

I have this to suggest—get good foundation animals, give them proper care, and they will pay you for it. I have often noticed at public sales that the higher priced animals are more eagerly sought after than those that go at low figures. It costs no more to develop the good ones, so let your initial investment be in good animals and your earnings will be far greater than if you start out with mediocre stuff that brings little better than grade prices.

An "IDEAL" Silo Pays for Itself

"My IDEAL GREEN FEED SILO is the biggest money-maker on my farm, and I wouldn't be without it for ten times its cost. My saving on feed bills the first year has more than paid for it." So writes a man who has learned by experience that the "IDEAL" silo returns big dividends.

Before buying a silo, investigate the "IDEAL." Get acquainted with its superior features. Learn why it is more economical, lasts longer and makes better ensilage than any other.

Only the choicest lumber goes into the construction of the "IDEAL" silo. The staves are of selected California Redwood, tongued, grooved, bevelled and splined by special machinery.

Refrigerator doors with "three point contact" make the "IDEAL" absolutely leakproof. They come flush with the inside walls of silo, thus preventing air pockets and spoiled silage. The ladder is securely fastened to the silo at one side of the doors. This permits easy access.

Heavy, soft-steel hoops, placed thirty inches apart, bind the silo into a true circle. Malleable iron lugs and long upset threads allow easy adjustment. Self-supporting roof—air-tight, watertight foundation joint and other features too numerous to mention here—put the "IDEAL" in a class by itself.

Fill out and mail the coupon. It will bring you, free of obligation, a valuable booklet on silos.

Insure Your Water Supply

The best way to maintain a constant, never-failing supply of water is by means of a Pacific Redwood Tank.

Pacific tanks have the everlasting qualities of the redwood of which they are built. As everyone knows, water preserves instead of deteriorating this wood. The patent non-shrinking system with which our tanks are fitted absolutely prevents leakage under all conditions.

Pacific Machine—Banded Wood Stave Pipe is the best and most economical for irrigation systems and pipe lines on the farm. Made in all sizes from 2 inches to 30 inches in diameter. Write for wood pipe circular and specifications.

Packwood Farm Holsteins

Headed by the 41 pound Bull

King Abbekerk Johanna Segis

In placing KING ABBEKERK JOHANNA SEGIS at the head of our herd we secured the highest record bull ever sold on the Pacific Coast. His dam is Adirondac Wietske Dairy Maid, 41.01 lbs. butter from 831.7 lbs. milk in 7 days, 158.30 lbs. butter from 3603.1 lbs. milk in 30 days, both of her butter records the highest ever made on the Pacific Coast.

His sire is King Segis Alcartra Abbekerk, son of the $50,000.00 bull King Segis Pontiac Alcartra, whose daughters are making splendid records in both short and long time tests. The first daughters of King Segis Pontiac Alcartra are now coming in milk and are making very substantial records.

The dam and sire's dam of KING ABBEKERK JOHANNA SEGIS average:

Butter seven days	35.64
Milk	666.20

Our herd is composed mainly of daughters of PRINCE HISKE WALKER, full brother to the 34 lb. 4 year old Lady Hiske Walker, and all of these will be mated with KING ABBEKERK JOHANNA SEGIS.

All we have to offer at present are some choice young sons of Prince Hiske Walker. Order early if you want one; as there are only a few left.

W. F. MITCHELL Owner, Visalia, California

King Ormsby Canary Johanna

Heads Our Herd

His Sire: SIR PIETERTJE ORMSBY MERCEDES, the greatest sire of producers and show ring winners of any breed. He has 66 A. R. O. daughters, 14 of them with records above 30 lbs., 2 with records above 40 lbs. in 7 days, 8 with records above 1000 lbs. butter in one year, 2 above 1300 lbs. butter in one year, and 20 of his daughters, mostly under mature age average over 1000 lbs. butter in one year. Three of his daughters sold for $10,000.00 or more each, and one of his sons for $65,000.00 at public sale last June.

His Dam: GLEN CANARY DE KOL, 34.59 lbs. butter in 7 days, 139.83 lbs. in 30 days as a senior 3 year old. (World's record when made). She has 3 A. R. O. daughters, including the great heifer Glen Canary De Kol 2nd, and one proven son whose first six daughters to freshen at an average age of 2 years 1 month have official records averaging 19.76 lbs. butter in 7 days.

His Full Sister: GLEN CANARY DE KOL 2ND:

Butter one year at 4 years 5 months (Second highest in class)	1323.36 lbs.
Milk	25590.60 lbs.
Butter at 24 months (Highest in world at age)	951.05 lbs.
Milk	17584.20 lbs.

Most of the females in our herd are granddaughters of Colantha Johanna Lad, and all of them are being mated with KING ORMSBY CANARY JOHANNA.

We have For Sale Young Bulls of This Popular Breeding

Longheath Farm

Fallon, Nevada

Diseases Caused by Improper Feeding

REFERRING to the high hog prices, an issue of the Berkshire World of some months ago, in fact, at a time when hog prices were not so high as at present, the editor of the World said:

"It is nothing short of a crime for a hog man to allow his hogs to contract diseases through carelessness. In keeping disease out of the herd the owner must be ever watchful and on the job. The following information on diseases given out by the Pennsylvania College is well worth consideration."

Prices have increased, we believe the need of the world has increased, until the words are truer today than when spoken, so we give some of the hints as to diseases caused by improper feeding, which may save more dollars today to the pork producer than when they were written.

Constipation

This may be a symptom or complication of another disease or may be caused by an improper combination of feeding stuffs and is in the latter case a disease in itself.

Symptoms: Notice straining and attempts to defecate. Hog dull, listless, loses appetite. Droppings hard and dry.

Treatment: Change feed to a sloppy diet containing bran. Give doses of castor oil or Epsom salts. Rectal injections assist in a more rapid recovery.

Rachitis

This disease is brought about by the lack of mineral matter in the feed. It occurs in growing hogs that are fed daily upon corn. Close, crowded quarters encourage the condition.

Symptoms: Animal seems unable to bear any weight upon hind legs. Bones in hind limbs may become fractured or bent. Distortion of bones of face may take place; this condition being commonly known as "snuffles".

Treatment: Prevention lies in feeding properly balanced rations to the growing hogs. Use with corn a feed which supplies protein and mineral matter in sufficient amount. Feeds which supply protein and mineral matter are tankage, oil meal or buttermilk. Provide comfortable quarters and plenty of room for exercise.

Diarrhoea

Like constipation, it may be a symptom of another disease or it may be brought on by irritant feeds. Sudden change from dry to green feed or irritation from intestinal worms may bring on condition. Treatment consists in avoiding conditions which are favorable to it; if a symptom of another disease, treat the original ailment first. Give light, sloppy diet and physics. Craig advises a preparation of bismuth subnitrate (one-quarter ounce), bicarbonate of soda (one-half ounce), Salol (one-quarter ounce). Give a teaspoonful in drench three or four times a day.

Poisoning

This is a fairly common condition amonge swine, largely growing out of the impression that a hog can thrive on any kind of refuse and waste material. The common forms of poisoning are caused by feeding meat brine, wash water and cottonseed meal. Meat brine will produce poisoning because as a rule hogs are not accustomed to salt and they will therefore eat greedily of the mixture. The brine material causes a severe irritation of the intestines.

Symptoms: Restlessness, convulsions, frothing at mouth, vomiting, severe pain, stupor and paralysis.

Treatment: Produce vomiting as quickly as possible. Give doses of zinc sulphate (15 to 20 grains) in warm water as an emetic. Raw linseed oil will assist in part in relieving irritation of intestines.

Poisoning from wash water occurs when hogs are fed slop to which wash water has been added. When slop is collected from hotels and restaurants, it sometimes happens that wash water has been poured into the slop barrel by careless attendants. Lye is the active poison in wash water. The symptoms are dullness, vomiting, marked diarrhoea, abdominal tenderness and nervousness. Vinegar given in the early stages has a beneficial action, as it overcomes the marked alkaline conditions.

Hogs that are fed cottonseed meal will develop symptoms of poisoning after a period of feeding. There are many other feeds which furnish protein at as low a cost as cottonseed and the owner runs no risk by using them. As a rule, no trouble will result from hogs following steers that are being fed cottonseed because the amount coming through in the droppings is very small.

Homemade Sterilizer for Dairy Utensils

A simple and efficient homemade steam sterilizer can be built at a cost not to exceed $5 to $10.

The ordinary washing of dairy utensils is not sufficient to insure freedom from bacteria. The only safe method of destroying in utensils germs which affect the hygienic and keeping qualities of milk and cream is by sterilization. Even when dairy utensils appear clean, if they have not been properly sterilized they may harbor vast numbers of bacteria which contaminate milk or cream that come into contact with them. Live steam at a temperature of at least 205 degrees Fahrenheit is a thoroughly effective agent and one that this homemade apparatus makes readily available on the average dairy farm.

When placed on a stove or oil heater the apparatus in question develops steam in a shallow pan and introduces the live steam through a pipe into milk cans and buckets. In sterilizing separator parts, small articles and strainer cloths, a galvanized iron box is placed over the steam outlet and used as a sterilizing chamber.

How to Construct the Sterilizer

The sterilizer for cans and milk pails consists of a roasting pan, a specially prepared, insulated cover for it, and a steam outlet pipe that runs through the cover. An ordinary roasting pan of standard size, about 20 inches long, 14 inches wide, top measurement, and three inches deep, will be satisfactory.

The insulated cover for the pan is in three layers, the lowest of which is a sheet of galvanized iron covering the roasting pan and lapping a little over the edges. On the bottom of the cover solder flanges to meet and fit the inside edges of the pan and make a tight cover.

For the steam pipe, cut a hole one and one-half inches in diameter and around it solder securely a steam outlet pipe four and one-half inches high and one and one-half inches in diameter.

To make the second layer of the cover, use a piece of asbestos board five-sixteenths of an inch thick and slightly smaller than the metal sheet. In the center cut a hole which will fit tightly around the steam outlet pipe.

For the top layer of the cover make a shallow pan of galvanized iron 14 inches square with sides five-eighths of an inch high, and cut a hole for the steam pipe. When the pan is pressed down tight on the asbestos, solder it firmly to the steam outlet pipe.

On the pan, solder, on edge, four strips of stiff, galvanized iron three-eighths of an inch wide. They should start one inch from each corner and should run to within one inch of the outlet pipe. These strips provide ridges which raise the milk can from the pan and permit free circulation of steam.

Paper may be used instead of asbestos for the middle layer of the cover. Pack papers tightly to a height of three-eighths of an inch over the galvanized iron bottom, and on top place another galvanized iron sheet of the same size. Solder these two sheets all around the edges so as to make

a tight seam. This makes an insulated cover and pad about three-eighths of an inch thick, which will be found as satisfactory and even preferable to the asbestos insulation.

Source of Heat

The sterilizer may be used on the kitchen stove or other stove or over any other heat that is sufficient to furnish steam at the end of the outlet pipe at least 205 degrees Fahrenheit or preferably 210 to 211 degrees. A thermometer, if placed in the outlet pipe, will show whether the steam is hot enough.

Operating

Place the outfit, with one inch of water in the pan, on the stove, and see that the cover fits tightly. The first steam that comes from the apparatus will have a temperature of about 140 degrees Fahrenheit. Wait until a thermometer placed in the outlet pipe shows at least 205 degrees Fahrenheit. Then place the milk can, previously washed and rinsed, inverted over the steam outlet and resting on the ridges. Sterilize for five minutes, remove, shake out any water, and place the can upright on the floor. The can should be absolutely dry in one or two minutes. If not, it is an indication either that the steam was not hot enough or that the can was not washed clean. Remember that the steaming does not remove dirt, so that previous washing is essential.

After Sterilizing

After steaming, place covers on cans as soon as both are dry and do not remove until the cans are to be filled with milk. The pails, as well as the tank and separator parts, should be kept always in a clean place, out of reach of dust.

WILL SELL WORLD'S CHAMPION BERKSHIRE SOW

One of the most interesting announcements of recent months is that of a public sale of Berkshires to be held by Castleview Ranch, Santa Rosa, early in 1920. J. Francis O'Conor, owner of Castleview, in speaking of this sale, said: "I have had this sale in mind ever since I first began breeding Berkshires some five years ago, but, until now, I did not consider I could offer the class of animals I considered should go into a public sale."

While the herd maintained at Castleview is not the largest it will rank favorably with that of any breeder, blood lines and individuality considered. When the Frank A. Brush herd, a herd famous from one end of the country to the other by the winning of two grand championships at the 1919 National Swine Show, was dispersed, Mr. O'Connor secured such animals as he desired to add to his herd. Among these was the grand champion sow Rookwood Lady 100th, a magnificent animal, representative of all that could be desired in a high class sow.

As a special attraction this sow will be included in this sale. Mr. O'Connor has had numerous offers from Eastern breeders for this sow. Only recently Frank Springer, secretary, American Berkshire Association, tried to secure her for one of the leading herds in the United States. Unless the Western breeders are alert and willing to pay the price such a sow is worth she will no doubt go to some Eastern breeder.

WHEN TO CUT CORN FOR FILLING SILOS

Corn cut when the grains have reached the glazed stage contain almost twice as much digestible matter as corn cut at tasseling time; corn cut at glazing time, therefore, is best for silage.

These statements, says Andrew Boss, of the Minnesota experiment station, are based on analyses made by chemists of the Dominion of Canada at Ottawa, which show that the corn from an average acre cut at the glazing period contains 7308 pounds of digestible matter as against 4220 pounds when the corn is cut at tasseling time.

Samples of corn were analyzed that had been taken at all stages from tasseling to silking, early milk and late milk, and glazing. These analyses show strongly in favor of allowing the corn to reach that stage of maturity when the kernels are well dented or glazed before it is cut. At that time the lower leaves are usually beginning to turn yellow. The figures show that while there is a larger amount of green corn on the acre when the corn is in the tasseling stage, the total amount of dry matter is not nearly so great then as when the corn has glazed.

The dry matter per ton amounts to 285 pounds at the tasseling stage, 323 at the silking stage, 398 in the early milk, 444 at the late milk, and 523 pounds at the glazing stage.

If there is any danger of frost, corn should be cut early rather than allowed to wait for the maximum pounds of dry matter.

SAVE THE JUNK

There is altogether too much junking of farm equipment. It is true that with latest improvements added to implements which are being manufactured today the temptation is strong to throw aside the old implements and purchase, sometimes on the installment plan, up-to-date implements. This is perhaps done with good reason and with profit, but too often the old implement is laid aside because from neglect after use it has lost much in appearance and even more in real efficiency.

Here are four suggestions for stopping this waste in junking farm implements before their appointed period of usefulness has run its course:

Paint every farm implement after every season's use.

Protect all bright metal parts with heavy grease.

Keep all implements under cover.

Keep a supply of spare parts on hand and keep every implement in repair.

There is a good reason for the bright and shiny coat of paint on every new farm implement. It is not there merely to dazzle the eye of the beholder. Nor is its purpose to add an aesthetic touch to an otherwise drab landscape over which Farmer Plowman homeward plods his weary way. It is there because the manufacturer knows that paint is the best preservative for his machinery. He knows, too, that if a coat or two of paint were applied every season to the once bright and shiny wooden parts, and if the metal parts were cleaned and greased at the same time, there would be a far more contented owner of the implement and a more satisfied dealer.

To save a few dollars on a single plow, or harrow, or cultivator, may not seem a big return for the labor of dragging home every implement and taking proper care of it. But the time to paint and care for every piece of farm machinery on the place is during the weeks when outdoor work is slack—when the plowing and planting are done, or the crops are in. Any dealer in paints of standard quality can advise the farmer as to the grades of paint best suited for use on different kinds of farm implements.

As a matter of fact careful painting and housing every season would raise the average of farm implement life in some states much more than a year. These farmers would have four or five million a year to buy extra bonds with.

That is no idle dream—but an actual possibility. Try it. And let the American farmer realize that there is a dollars aud cents advantage in the "save the surface and you save all" doctrine!

Prince Gelsche Walker Korndyke

The first Native Son to sire a 31.80 pound junior three year old daughter. His sire is the only bull in the west to sire a daughter making two world's records. His daughters all have remarkable udders, milk strong and test high throughout their entire lactation periods.

A Wonderful Sire

SIR AAGGIE DE KOL ACME is the only son of the world's record cow for butter in 365 days on strictly official test. His sister, from the same cow, is entering on her seventh month in test and running close to a world's record for a junior two year old.

KING KORNDYKE PONTIAC (shown below), son of the mighty King of the Pontiacs, the bull with more 40 pound, more 30 pound, and more A. R. O. daughters than any other bull in the world.

Sons and daughters of each of these sires will be in our exhibit at the State Fair.

You can use a young bull. Why not one of Jane Garden "Quality" guaranteed right in every respect?

Selling Live Stock at Public Sale

By W. S. Guilford

ONE of the most important features of the pure bred live stock game is the selling end. Competition is rather keen in this business just the same as in other lines of industry. The method to be followed will depend somewhat on local conditions, the size of the herd, the general plan adopted for disposing of the surplus, that is, the age at which most of the stuff is offered for sale.

In general there are two methods open to the breeder. He can sell all his surplus at private treaty or he can adopt a plan of selling his yearly productions through a public sale, or he can use both systems. Each plan has its advantages. If the amount of surplus is comparatively small, it is perhaps more satisfactory to sell privately. If the herd is of sufficient size, then the public sale offers a very satisfactory method of distribution. When stock is sold at private sale the selling is a contiuuous business throughout the year, and some money is coming in all the time. Under a system of public sales the year's business is practically wound up in one day, and all the money is in hand and the details of registration, transfer, etc., are largely attended to at one time.

The writer believes that the public sale offers one of the best ways to advertise a herd and farm. Under this system hundreds of people, who are interested to a greater or less degree, come to the place. Thus they become acquainted with the seller and the breeding herd as they would not when private sales were the chief method of selling. Such publicity is good for the herd and for the breed.

When pure bred stock is being introduced into a new community or territory interest can be stimulated through the auction sale as in no other way, and many new herds can be started, while if private sales were depended upon it might take many years before there is a wide distribution.

Many people like to buy at auctions for the reason that they are able to get the benefit of the judgment of other people. If, for instance, a man who is a competent authority on a breed is willing to pay a certain amount for a particular animal, the new buyer often feels much safer in paying $5 or $10 more than he would at private sale. Public sales also serve the very useful purpose of bringing breeders together, and they thus become acqualnted with each other.

That the public sale method of selling live stock is satisfactory is proven by the fact that a large part of the livestock sold in Great Britain passes through the sale ring. It is also true that thousands of head are sold in the Middle West every year under the same system, and the number is increasing.

The general practice regarding the sale of stock at public auction is much the same. Many breeders attend to all the details of the sale themselves, in the advertising, hiring of auctioneers, ring men, catalogs, etc., and in time learn to conduct sales very satisfactorily. There seems to be a tendency though for the business to get on a specialized basis and to delegate the entire arrangements to a sales organization. Such organizations are in charge of experts who are thoroughly familiar with values, who have a wide knowledge of the advertising game and who make it their duty to keep in touch with prospective buyers.

There is such an organization operating in this state—the California Breeders' Sales and Pedigree Co., of Sacramento. The experience of the of the Butte City ranch with this organization has been very satisfactory. The organization enjoys the confidence of the general public, and the manager, C. L. Hughes, is held in the highest esteem by all who know him.

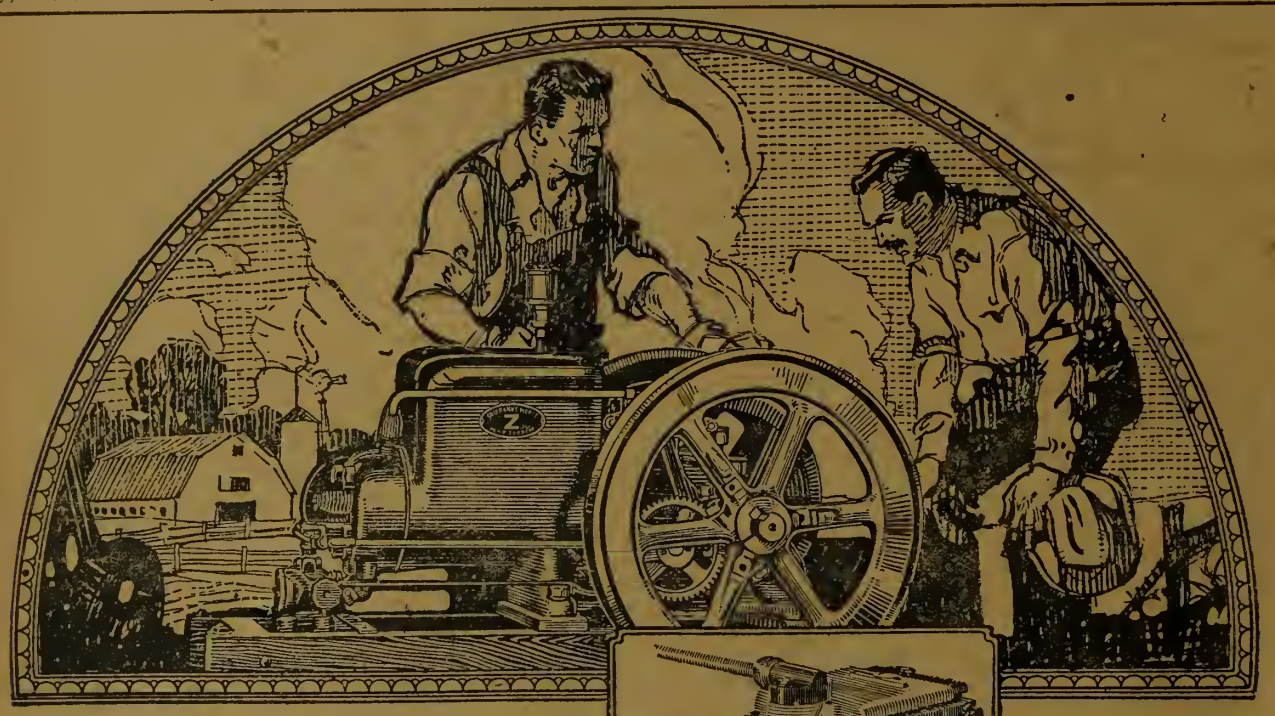
It appears to the writer that the experience such organizations have accumulated through the holding of many sales ls such as to render their services of extreme value.

The growth of the public sale in this state has, up to the present year, been rather slow. This fact is accounted for, I believe, by the fact that until quite recently few breeders were operating on a scale that would permit them to hold a sale of their own. With the marked expansion of the business during the past few years, conditions have changed and the auction plan of selling is becoming very popular. Within a very few years the number of sales will increase materially.

It will therefore be well for the breeding interests to bear in mind that the success of a sale will depend on the confidence of the buying public, and inasmuch as confidence has been built up to the present time, the greatest care should be exercised to see that nothing happens to in the least way destroy that confidence. The breeders of registered Holsteins have been the leaders in the development of the public sale method of selling, and it is a recognized fact that cattle of this breed can be offered at auction and not only bring what they are worth, but find a ready sale.

Many of the leading breeders have made their start in the business with purchases made in public sales, have added to their herds by the same method and are now disposing of their surplus in the same manner.

The auction method of selling is bound to have a wide development in this state and the public can look to these sales as affording opportunities to make selections of high class breeding stock at values that they set themselves.



Fairbanks-Morse "Z" Engine with Bosch Magneto

Farm Engine Supremacy

THE famous "Z" Engine and the Bosch high tension, oscillating magneto combine to make the one SUPREME farm engine. ¶ The dependability of the Bosch in delivering a steady succession of hot, intensive sparks is well known and adds the one possible betterment to the "Z"—always recognized as America's foremost farm engine. ¶ Call on your "Z" Engine dealer and see the result of this newest combination—FAIRBANKS-MORSE "Z" WITH BOSCH MAGNETO. ¶ Over 200 Bosch Service Stations assist our dealers in delivering maximum engine service. ¶ Prices—1½ H. P., $75.00—3 H. P., $125.00—6 H. P., $200.00—all F. O. B. Factory.

Fairbanks, Morse & Co.
MANUFACTURERS CHICAGO

REPAIRS TO AUTO WINDOWS

Nothing so mars the appearance of an auto top as cracked, broken, or torn out rear windows. If motorists knew how easily this condition could be remedied, there would be fewer tops appearing in such a shabby condition.

The work can be done by the car owner himself in an hour of his spare time and the necessary materials—sufficient transparent sheeting and a tube of pyroxylin cement—may be purchased at any auto supply store.

The windows are sewed in with a double row of stitches. First cut the inside row of stitching. Leave the second row. Then cut out the broken light leaving a strip about one-half inch wide all around and held in place by the stitching left intact. Cut the new pane the right size and cement it to the edges left on the old pane.

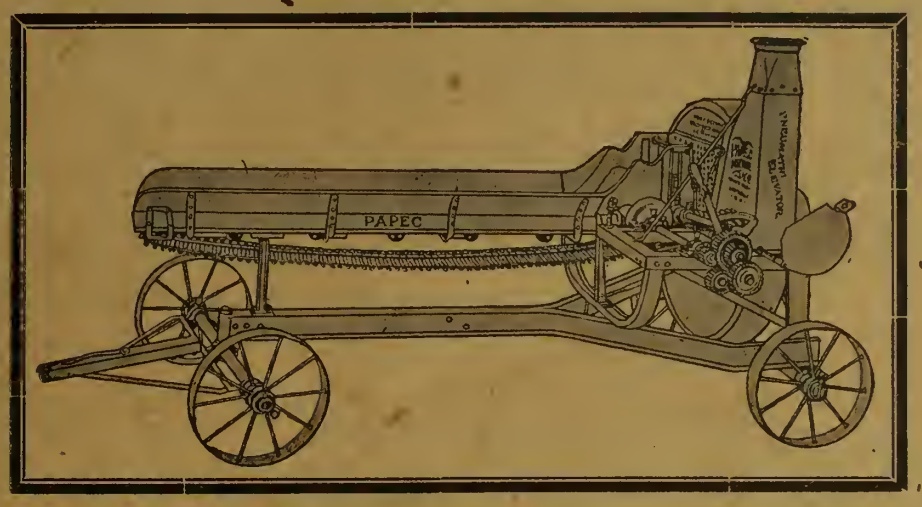
This method makes the cost of the replacement less than a dollar.

It is a fact that the circumference of a pulley or gear is always 3.1416, or approximately 3 1-7, times its diameter. This makes it easy to compute speeds by considering only the diameter of both driver and driven pulleys. For example, belting from one six-inch pulley to another gives the same speed to both, but if the driving pulley has a diameter of 16 inches and the driven pulley a diameter of four inches then the driven pulley makes four complete rotations to one of the 16-inch pulley. If the small pulley is made the drive pulley, then it will make four revolutions to cause the driven pulley to revolve once. The same general rule applies to gears if the pitch diameter and not the outside diameter is taken. Also instead of the pitch diameter the number of teeth in the gears may be considered.—P. Goeder, Colorado Agricultural College.

Perhaps the most interesting metals of all are sodium and potassium. They are usually mentioned together because they act in almost the same way. If a piece of either is placed on water it does not sink but spins over the surface and often, in the case of potassium, bursts into flame. After the metal has dissolved in the water, it will be found to be soapy. If the metal is placed on water colored with red litmus, the water will turn blue. If the metal is placed in pure concentrated sulphuric acid nothing will happen, but if a drop of water is added there will be a violent explosion.—Boys' Life.

Let The Papec Cutter Save Money For You

Fill your silo at the right time. Own a "Papec" and be sure of your winter feed.



Feed cut hay to your stock. It takes less space and stops waste.

Don't wait for your neighbor to fill his silo in order that you may use his ensilage cutter. Get a "Papec." When your silo is ready for filling you won't have to depend upon someone else. The "Papec" will enable you to preserve the full value of your crop by handling it at the right time. This saving will soon pay for your silo.

The "Papec" has a solid semi-steel frame. No screws or bolts to loosen. It requires less power and will handle more ensilage and "throw" it farther than any other. Note the illustration of the wheel. Six fans on cutting wheel do the trick.

The "Why" of the Wheel

An ensilage cutter with four or less fans requires an elevating pipe large enough to receive at least one-fourth of the ensilage cut at each revolution of the cutting wheel.

Thus the Papec, with its *six* fans and *small* pipe, "throws and blows" a steady stream of ensilage with a force more concentrated and with a pressure much greater than a cutter with four or less fans and a larger pipe.

The Papec Ensilage Cutter requires less power and elevates higher. The knives shear keen and clean.

See Our Display at California State Fair, Sacramento

The "Simplex" Silo has stood the test of time and has proved to its thousands of satisfied owners that it offers the surest means of increasing their profits.

The "Simplex" is substantially built throughout. Doors, frames and staves are of *Clear Oregon Pine.* No end joints. Staves and door jambs are in one piece, the height of silo. Hoops are of new steel with heavy malleable adjustment lugs. Doors are of the two way type, swing or lift.

Our interlocking anchor system makes the "Simplex" windproof. Cable braces run diagonally from top to anchor bolts imbedded in foundation. Not a weak place in entire construction.

The Crisell Tangent Top keeps the "Simplex" always in a true circular outline. This is a patented feature of the "Simplex" and one of the secrets of its success.

Increase Your Profits

The "Simplex" Silo and the "Papec" Cutter are a combination that will yield big returns on the investment for many years. They are both guaranteed. Money back if they don't stand the test. Send the coupon for full particulars, prices, etc.

FARM LANDS FOR SALE

For Sale on Account of Death and dissolution of partnership, our home of 67 acres; 50 acres in nuts and fruit. Good income. No gravel or waste land; some alfalfa. Beautiful location on the S. P. R. R. 11 miles from Sacramento; 1 mile from Elk Grove. Fine schools; good roads; all conveniences. Place noted for its fancy products. See some of these in Sacramento County Exhibit at State Fair. Buildings, pumping plants, etc. A-1. Price includes tractor, team, farm equipment, farm tools, etc. No better bargain ever offered. Tribbie Bros., Elk Grove, California.

For Sale—Fruit and Poultrymen—It will be to your advantage to write today for information about the Paradise district—deep rich soil—ideal mountain climate. (Above frost and fog.) Electricity and an abundance of pure water.
Choice tracts $100 per acre.
PARADISE LUMBER CO.
Paradise, Butte County, California.

For Sale—$1000, clear 160 acres, 30 miles NE. of San Diego. 25 acres tillable, rolling; 15 bottom, 3 plowed, balance grazing. Small new house. Well, spring, abundance soft water; timber. Fine bee, cow, pig proposition. No trades. E. T. Gray, (Owner), Petrolia, Humboldt Co., California.

For Sale—Improved Farm, 240 Acres, part alfalfa, part corn. Two new houses, barns, corrals, fences, etc. Good loam soil, suitable for alfalfa, grapes or deciduous fruits. Located near Porterville in well improved district. For particulars write to W. E. PREMO, Porterville, California.

For Sale or Trade—160 acre ranch will sell with stock and equipment, or will sell land alone, have A-1 land, near town, lots of water; or will rent to reliable party. I have other business and must sell or rent this place. For full particulars address, Chas. E. Johnson, Yermo, California, Box 34.

IMPERIAL VALLEY RANCHES
Bought — Sold — Exchanged
Money to Loan—Choice 8 per cent First Mortgages for sale. Information cheerfully given.
Western Pacific Securities Co.,
Barbara Worth Hotel Building
El Centro, California.

Livingston Lands For Sale—I have several small tracts of Livingston sandy loam, unimproved, which I will sell at a fair price and on reasonable terms. Will take Liberty Bonds at par in full or part payment. G. H. Winton, First Bank of Livingston.

For Sale—Finely equipped poultry farm at Atascadero, California. Write for particulars and terms. Bestrun Egg Farm, Atascadero, California.

40 Acres, Good Soil; fine for berries, vegetables, poultry and cows; plenty of water and wood. H. Koenig, Fort Bragg, California.

TREES

For Sale—3000 select orange trees. Also 3000 lemon trees; first class trees; 20,000 seed bed stock. A. R. Rideout, Whittier.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

BUDDED AVOCADOS
MATHER'S AVOCADO NURSERY

The Garden Beautiful in California by Ernest Braunton, a 200 page book fully illustrated tells you how to beautify your home grounds and the proper trees and shrubs to plant, also best methods of gardening. Cloth binding $1.00 postpaid. Cultivator Publishing Company, 115 No. Broadway, Los Angeles.

For Sale—Fancy Recleaned amber Sorghum and Sudan grass. Also hand-picked Seed beans; any quantity. Stock pumpkin seed 20c per pound. Aurora Seed Mill, Stockton, California.

Write for Circular and Prices of Seeds. Wanted Sudan, Hairy, Smooth, and common Alfalfa Seed in car loads. Box 501, Fowler, California.

HOGS

CASTLEVIEW
Giant Type Berkshires.

We are booking orders for spring pigs from Grand Champion sows and sired by Mayfield Rookwood, sire of Champion barrow at 1919 Western Berkshire Congress.

Castleview Ranch, Santa Rosa, California.

GRAND NATIONAL CHAMPION
Baron Duke 201st, 200001
Do you realize this is the only opportunity you have ever had on this Coast to secure the pigs of a Grand National Champion? Duke is breeding them long and thick. He is getting old and may die any time. You are started right if you get his pigs. A very good April boar pig sired by Duke and from a half sister of Rincons Rival 2nd, cholera immune, $35.00. Sandercock Land Co., in charge of Natomas Sales, 23 Montgomery Street, San Francisco, California.

Wondercrest, California's leading Poland-China sire—big himself, bred big and his pigs show the same qualities. His dam was Giantess Wonder, his sire Big Jones—both big, both winners—a combination of the greatest blood of the breed. Breed big type Polands. Start right by using this blood. Write for special offer. A liberal consignment made to the Tulare Poland-China Associated Breeders' sale held Tulare, October 21st. OXBONE Herd Poland-Chinas, Tipton, California.

Billiken Chester Whites; July offering none; August offering consists of 8 boars and 5 sow pigs, this spring farrow. All are now cholera immune. Will have a full exhibit at the State Fair this year and will show some good ones. Call around and look them over. I'll be there to do business. C. B. Cunningham, Mills, California.

Grape Wild Farm Berkshires—Guernseys—spring pigs sired by Big Leader and Grape Wild Farm Leader. Guernsey bull up to 8 months old. A. B. Humphrey, Prop., Escalon, California.

Rancho Del Sur Durocs—A few good growthy fall boars sired by Orion's King Gano and California Orion Cherry King. Satisfaction guaranteed. Donald H. Graham, Box 569, Lancaster, California.

I Have a Few Registered Duroc-Jersey boars farrowed February 15, 1919, sired by P. & L. Great Model No. 233141. If you are looking for something good see them. F. C. Richey, Jr., R. F. D., Box 120, Hemet, California.

The Best in the West—California Gertsdale and Presidents Equal are my herd sires. Fall and spring boars now ready to move; each one a corker. Dr. J. A. Crawshaw, Hanford, California.

Faifadale Farm Durocs, Perris, California. Our $2000 boar, Great Orion Sensation, Jr., heads herd. Fifteen prospective litters by Giant Orion. Write B. H. Wilkinson, Mgr.

Duroc-Jerseys at Ireland, home of Cherry Volunteer II and Ireland's Joe Orion. Ranch at Owensmouth, California, City Office, 1219 Brockman Building, Los Angeles, California.

A Few Poland-China Boars ready for light service by King's Big Bone Leader and President. Priced right. Full particulars on request. John M. Bernstein, Hanford, California.

Duroc-Jerseys — We won more money on Durocs at the State Fair than any other exhibitor. Why not get some of this winning stock? June Acres Stock Farm, Davis, California.

Pure Bred Duroc boar farrowed May 12. Golden Model and Defender blood lines. All sold but one, $40.00. W. N. Prince, Spurgeon Bldg., Santa Ana, California.

Pathfinder and King's Col. Stock, immune. Weanlings $25 each. Bred gilts and service boars. Derryfield Farm, Capital National Bank Bldg., Sacramento, California.

Have Sold All the Pigs advertised recently. Will have fine pigs from spring litters for sale in June. Fine Shropshire ram lambs, pure bred, for sale. J. J. Prendergast, Redlands, California.

Big Type Durocs—Herd headed by California Orion King. Am offering some excellent boar pigs of spring farrow. Inquiries solicited. Prices reasonable. Harvey M. Bergiund, Dixon, California.

SWEETWATER DUROCS
The most popular herd in the West. Winsor Ranch, Bonita, San Diego Co., Address: R. K. Walker.

Large Yorkshires—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, California.

Fine Chester Whites, 2 months, 4 months. Very reasonable. K. Wellman, Los Altos, California.

Duroc-Jersey Swine For Sale, best blood lines. Bred sows and gilts, service boars. Jersey Queen Farm, San Jose, California.

For Real Good Berkshires, cholera immune, write Frank B. Anderson. Box 724, Sacramento, California.

Poland-Chinas — A few good breeding boars. S. F. Williams, Chico, California.

A. R. Bardrick, breeder of Duroc-Jersey hogs. Stock for sale. Oceano, California.

El Profito 296867, a 900-lb. line bred Big Timm boar in service. Write. Viola L. Renwick, Santa Barbara, California.

Tamworth Hogs, Registered and true bacon type. C. E. MOYER, Hemet, California.

Pure Bred Poland-China Boars, three months old, $25.00 each. J. R. Carhart, Fullerton, California.

REGISTERED BERKSHIRES. FAIR OAKS RANCH, WILLITS, CALIF.

POULTRY

OUR SPECIALTY

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Showy Ditch Weed

A subscriber at Brawley sent in a showy flowering weed growing along the water ditches. The first plant sent seemed to be campanulaceous, but as it had no seed pods definite determination could not be made. A second plant, with mature seed pods, showed it to be Vaccaria Vulgaris, the "cow herb," a member of the carnation family.—E. B.

Cactus For Cow Feed

We have fed cactus for five or six years to our cows. First we fed the wild singed cactus and later the spineless. Cactus does not dry up their milk. It makes well flavored milk and firm yellow butter. We chop the cactus into rather small pieces and mix it with cottonseed meal and a little salt. A cow is fed a kerosene can full night and morning. In addition we feed alfalfa and a sorghum fodder. We are planting out more cactus this summer.—A Reader.

Lime on Sandy Soil

I read in the Columns of the Cultivator an article about stone lime as a fertilizer. I have an apricot orchard which is about 10 years old. The soil is a sandy loam and needs fertilizing. Do you think the lime fertilizer would be good and what would it cost? Where can I purchase it?—Subscriber, San Jacinto.

We believe your sandy loam would be more benefited by the application of a vegetable manure, that is, bean straw, stable manure, corral scrapings or the like. A very heavy clayey soil which tends to acidity is very materially helped by the application of lime or better, very finely crushed lime stone. But with little question the sandy loam is not acid and most California soils are sufficiently supplied with lime to meet the requirements of most plants. An examination of the soil, using blue litmus paper to determine as to its acidity and content of vegetable matter would probably enable one to judge fairly accurately as to its needs. A great help toward this determination is observation of the behavior of the soil in the production of the crops.

Curing Skins for Raw Hide

Please give method of procedure to make raw hide from calf skin.—Subscriber, San Jose.

The skin should be salted on the flesh side as soon as the hide is cooled after removal, using ten to twelve pounds to a full sized skin. After salting roll the hide tightly. When ready for tanning place the hide in "soak," simply water to remove blood and salt. After being left in this 24 hours the tail and feet may be cut off and the flesh adhering scraped off, after which the hide should be placed in lime water. To make the lime solution take a bucket of water to each quart of lime. When thoroughly slaked and mixed, immerse the skin and allow to lie for three to four days. Thoroughly wash in cold water. Scour and pound in good soapsuds for half an hour, after which take white vitriol, alum, and salt, one tablespoon each to skin, and dissolve in sufficient water to cover skin. Let remain in this 24 hours. Wring out and dry. To soften, oil with neat's foot oil or currier's oil. It may again be washed out in soapsuds and hung until nearly dry, when it should be worked and softened. If it should remain hard and refuse to soften, repeat the soaking in suds.

Crown Gall

A year ago last February I planted 200 almond trees which have now developed near the base or at the top of the roots a spongy growth. Please tell me what the trouble is and how to cure it if that is possible. If it would be advisable to dig out the trees would it be safe to plant new ones on the same ground?—Subscriber, Denair.

This appears to be a case of crown gall. Where trees are as young as these and the gall is found entirely around the crown we would remove and plant new ones, using greatest care in securing trees free from any root knot or crown gall infestation. Where those now planted are very thrifty and the gall or knot is comparatively small it may be removed with a sharp chisel, taking care to leave no portion of the gall and cut down to healthy clean wood. This cut may then be painted with Bordeaux paste and later with grafting wax or some other protector. If this work is well done the crown gall may not return.

CALIFORNIA SUGAR BEET GROWING

To assist sugar beet growers in deciding upon the best farm practices in raising a crop and determining the cost of production, specialists of the United States department of agriculture have made a study of four of the most important sugar beet areas in the United States. In two of the California districts, Los Angeles and Salinas, on the farms visited more than 50 per cent of the tillable land is utilized in growing beets, while in the other district, Oxnard, over one-third of the tillable land is devoted to this crop. The average acre yields for the three districts during the period covered by the study (1915-16) were: Los Angeles, 14.52 tons; Oxnard, 9.53 tons; Salinas, 15.59 tons. The cost per acre during this period was, for the Los Angeles region, $67.11; Oxnard, $54.88; and Salinas, $66.45. In general, the bulletin says, as acreage increases acre cost decreases, while as yield increases acre cost increases, although cost per ton decreases.

Labor Principal Cost.

Labor was the principal cost item in the three districts, amounting to 50 per cent of the total cost of production, while the use of the land amounted to 35 per cent. The more important factors which enter into the cost of producing sugar beets are labor, interest on land or rental, seed, water, taxes, and insurance. While these factors expressed in terms of money values are variable, such items as hours of man labor, hours of horse labor, pounds of seed, hours of use of equipment, and amount of fertilizers required do not fluctuate appreciably.

Beet tops are usually plowed under in the Salinas area. They are of considerable value for fertilizing the land, the best results being obtained when they are evenly distributed over the field. After they are cut the tops are allowed to remain in the rows, but before the land is plowed they are scattered over the field with a harrow, one harrowing being sufficient. Farm manures are used in the California areas to enrich the soil, but they are exceedingly scarce.

Deep Plowing Needed.

For the successful production of an intensive crop like the sugar beet, it is necessary to have a deep, well-prepared seed bed. In regions where rainfall is limited and occurs mainly during the winter, as in California, it is especially desirable to practice deep fall plowing. This enables the soil to store large quantities of water during the rainy period, and increases the yield by facilitating the development of a beet with a long tap root. On the farms included in the study the depth of plowing ranged from an average of 9.5 inches in the Salinas district to 11.5 inches in the Oxnard district.

After the seed bed had been further prepared by rolling, harrowing, and leveling, the seeding was done from December 1 to June 1, the time varying according to localities. Cultivating ranged from February 15 to July 15, but in the Salinas district it was practiced chiefly in May, June and July. The first cultivation preceded blocking and thinning. In the Los Angeles and Salinas areas irrigation is sometimes necessary, but usually only one irrigation is required.

SPRINKLING NOT BEST WAY

The question of irrigating the vegetable garden, especially in cities and towns where the use of water is more or less restricted, is of considerable importance at this season. The main point in such irrigation is to supply a proper amount of moisture with the least work possible. R. A. McGinty of the Colorado agricultural college gives the following suggestions:

"It is often the custom for gardeners to water with a hose. This is not satisfactory in many cases, however, due to the fact that sprinkling must be continued for a longer time than many imagine, in order to wet the soil thoroughly, and in a very short time the plants need to be watered again. The water so applied usually penetrates only to a slight depth, which encourages the vegetables to form a shallow root system, which allows them to be quickly affected by dry weather.

"The best way to irrigate plants is to make a shallow furrow just to one side of the row and run a stream of water in this. The water from the hose may be allowed to run into a furrow across the ends of the rows and be led into several irrigation furrows at one time. If the nozzle must be left on the hose, as is usually the case, the water may be discharged into a wooden box or old gunny sack, to prevent splashing, and then led into the irrigation furrows. The water should be allowed to run for a sufficient time to wet the soil thoroughly. This may be determined by digging down for a few inches.

"By employing this method, not nearly so much water is lost by evaporation, the surface of the soil does not bake so badly, and the water applied reaches the roots of the plants where it is needed."

SOME INTERESTING METALS

Most people think of metals as heavy, solid, non-combustible materials. What would you think had happened if, after using a spoon on a hike, you had placed it in hot water to wash it and found it, when you came to take it out, at the bottom of the water in a shapeless mass? This would happen if you used a spoon of an alloy of lead which melts at a temperature below the boiling point of water. If you hold a strip of magnesium, a very light metal, in the flame of a match it will catch fire and burn with a brilliant white light. This explains the use of powdered magnesium in flash lights for photography.—Boys' Life for July.

WILL DISPERSE

at Public Auction

THEIR ENTIRE HERD OF APPROXIMATELY

60 - - Registered Ayrshires - - 60

State Fair Grounds, Sacramento, Calif.

Tuesday, September 16th, 1919

The offering will include imported cows as well as cows selected from some of the best herds of the United States and Canada.

Many of the females are out of dams with official Canadian Record of Production records, and the breeding throughout represents many of the most favorably esteemed Ayrshire families.

There are a number of granddaughters of Willowmoor Robinhood, whose dam, Netherall Brownie 9th, made 820.9 lbs. butterfat from 18,110 lbs. milk in one year.

There will also be sold a number of granddaughters of the famous imported bull Beuchan Peter Pan, grand champion at the National Dairy Show and at the Panama-Pacific International Exposition.

The bulls will include the two herd sires, STEYBRAE MASTERPIECE, a 3 year old, and PRESTON PREMIER, a beautiful two year old. In addition to these there are a few sons of the best cows in the herd, ready for service, and several younger bulls.

THESE ARE CLEAN, HEALTHY CATTLE. THERE POSITIVELY IS NOT AT PRESENT, NOR HAS THERE BEEN ANY CONTAGIOUS ABORTION IN THIS HERD. THE NUMBER OF CALVES IN THE HERD, TOGETHER WITH THE LARGE NUMBER OF FEMALES DUE TO CALVE SOON, TELLS THE STORY IN THIS RESPECT.

Every animal over six months of age tuberculin tested by a State veterinarian.

This is a rare opportunity to secure well bred, healthy, registered Ayrshires, in an excellent selection ranging through mature cows, bred and open heifers, heifer calves, service bulls and bull calves, and every animal goes to the highest bidder without reserve or limit.

Catalog of sale is now being prepared and will be mailed free on request.

Sale Starts Promptly at 10 A. M.

The Outlook For Draft Horse Breeding.

By R. P. Royce

WHEN the ledgers begin to make their inevitable charges, the horse will have his due or I am mistaken." The remark just quoted was recently made by W. J. Sour, superintendent of transportation, Wilson & Company, Chicago, in an article written for the Breeders' Gazette. For fear that some might regard the above remarks as being made by a prejudiced friend of the horse, we quote further. Mr. Sour says: "I have no axe to grind. I am interested in two things only: Keeping down the costs and securing the utmost efficiency in deliveries. . . . I am not interested in the horse business. . . . The figures I present tell their own story. We could no more do without the trucks to deliver our product within a radius of 30 miles than we could do without teams to do our work close in, within a radius of 10 miles of our plant."

The above should be of interest to all and should furnish food for thought for those who have been preaching the doom of the horse and encouragement for those who have held fast to the belief that the horse is still a factor in the haulage, transportation and power problems of our daily life.

During the past few years the horse business has undergone a profound change. Of that fact there can be no doubt. With the marvelous development of the automobile, truck and tractor industry, horse breeding has been forced to undergo a tremendous readjustment. This readjustment is still going on, and for that reason, it is well for those who are interested to view the problem in a sane and calm light.

Aside from the fact that the horse business has always been operated on a more or less sentimental basis, and that it has been surrounded with considerable romance—perhaps more romance than has been given any other branch of live stock production—it is utter folly to deny the changes that the past few years have wrought, or to go to the other extreme and assume and admit that the horse is done for.

The primary reason for the use of horses was the fact that horse power was efficient. Had any other form of power been discovered it is certain that it would long ago have superseded the horse. Despite the fictionists and poets, the world has always been a practicable world—only those things that fitted into the general scheme of things have been given a place, and only for so long as conditions justified their continuance. There is no mistake but that the automobile has very largely displaced the light horse for both business and pleasure.

Of course, certain types of pleasure horses will continue in demand purely for pleasure, not because they are economic necessities. But how about other types, the draft horse, the real work horse? Unless he fits in somewhere he must go, but so long as he fills a place economically he will continue in demand. Does he fit in? Is there a demand for such a type? In the face of public opinion it is necessary to make clear the economic status of the horse.

There has always been and always will continue a demand for power. The industry of the world is based on and is dependent on horse power. It matters little whether horse power is

The Kind of Stallions Needed in California

Aiglonel, four year old Percheron stallion at the head of the University Farm Stud.

A Profitable Kind of Mare

Poule of Palcines, a pure bred Percheron mare owned by the University Farm. Mares of this type will pay their keep with work and raise a profitable colt. The colt was sired by Aiglone, owned by University of California.

furnished by horses or some other form. Power is needed and the only kind that the world looks to is the cheapest form of efficient power. Now unless it can be demonstrated that the horse is efficient and more economical at certain work than other forms of power, there is no rational reason for arguing the case of the horse. But if it is proven that there is still a place for the horse to fill, the wise man will see the opportunity, familiarize himself with the kind of horse needed and set about to produce that kind.

The necessity for the horse in farm work is too generally admitted to need comment. The farms of America will always require horses. What the horse producer wants to know is whether or not he can expect a profit for his surplus horses. Will it pay to raise horses, and if so, what kind.

The horse market has always been based on the demand furnished by city users. Does that demand still exist and is it likely to continue? Can the horse compete with the truck? Here is what Wilson & Company have found out, and the facts are declared to be "in general agreement with other traffic managers." According to the carefully compiled costs of that firm, it costs approximately twice as much per ton to make deliveries in the Chicago territory with trucks as with horses. The figures follow:

"The trucks referred to are of two-ton capacity. They are geared at 30 miles an hour. They cost $2200 each. Sixteen of them are used to deliver packing house products in the Chicago suburbs bounded by Waukegan, West Chicago and Gary. They leave the Wilson plant at 6 a. m. and get back at 4 p. m. They are out on the long drive only three days a week. One extra truck is used for replacement purposes. It replaces a different truck every day, so that one truck is overhauled every 16 days. This system is found to lengthen the truck's life by two years. The cost of delivery will be five cents per cwt. higher this year than a year ago, because the trucks are a year older and require more repairs, tires and so on.

"The Wilson delivery teams weigh from 3200 to 3500 pounds. They journey to the loop with more than two tons to the load. They may be loaded up to four and one-half tons, or more than twice as much as the trucks will carry. An overloaded truck soon goes to pieces; an overloaded team will struggle along for a while and the owner is out only an extra handful of oats. A single horse will haul easily 4000 pounds, which is the capacity load for one of the trucks in question.

"Our horses actually last 15 or 16 years in harness, though we figure the depreciation on teams at 20 per cent per year as compared to 25 per cent on the trucks. I recently sold a team which had been in service 17 years for $100; the horses were 21 and 24 years old. The company owes most of the horses and equipment a lot of money. After they work five years they are clearly 'in the velvet.'

"The average cost of teams is about $500. A double wagon costs $375 and harness about $95. The highest-priced work horse in the Wilson stable cost $287."

The above has been quoted at length because the information set forth is unimpeachable and is one of the strongest arguments for faith in the continued demand for draft horses.

That Europe will require large numbers of heavy horses is an established fact. Exports are being made weekly. The big problem for the horse raiser to solve is the production of the kind of horses that are and will be in demand. Beyond a doubt the type of horse that will sell to advantage is the big, sound draft horse of quality. The market will not tolerate small and unsound stuff. Such being the case it behooves mare owners to pay more careful attention to the kind of stallion they patronize and then remember that size only can be developed by a practice of liberal feeding.

Spend thought before you spend money; you will have more for your money and more money left for your thought. Buy W. S. S.

HE DIDN'T TAKE THE CULTIVATOR EITHER

To the concluding paragraph of this item add its head and you get the answer to the problem stated by a writer in an agricultural college news bulletin.

A man we once knew never seemed to get along very fast, and everybody wondered why. He was a man endowed with average intelligence and a hard worker, but he never seemed to amount to much so far as influence in his community was concerned and he did not make a very big success on his farm, although he did make a fair living. He never knew when a sale was coming off where he might pick up a valuable cow or horse or piece of farm machinery; he and his family missed half of the fun of living because they never knew when things it was good to go to were going to happen; he sent his crops to market when they were harvested and took whatever the market price happened to be that day without any thought of watching for propitious times; he not only knew little of what was going on in the outside world, but he did not know what was going on within his own county, his own home town and even his own farming district. Consequently his friends seldom stopped to chat about public matters and he was never consulted regarding any movement for community betterment.

This man did not take his home town newspaper.

The cannery at La Sierra Heights is now operating on peaches. It expects to run a full force of employes until the middle of December.

There is Money in Good, Sound, Draft Horses

Read This:

Good big, sound, draft horses of quality are worth more money today than ever before. The market is greater than the supply. The economic status of the horse is unquestioned. He holds and fills a place that can not be taken by any mechanical contrivance. Many big city firms are replacing trucks with horses because the horse is more economical. Europe is short on horse power and it will take years to supply that demand. Already the export trade has reached large proportions and is only limited by the lack of shipping space.

Now is the time for Foresight

During the past few years the decrease in the number of mares bred has been alarming. The result is inevitable. There will be a marked shortage in horses. As a matter of fact the shortage is already at hand, and is bound to increase. The man who sees the opportunity and prepares now to meet the great demand is certain to reap splendid profits. The man who makes the most money is the man who has an article to sell when the demand is keenest. Now is the time to use foresight. But, keep this fact in mind: only big sound horses will be in demand.

See My Percherons and Belgians at the State Fair

I will have an extensive exhibit of both PERCHERONS and BELGIANS at the State Fair and I feel sure that among them are horses that will please the most critical buyer. I know the kind of horses California needs and I have that kind. Considering the quality, the prices are right.

I will be pleased to have all who may be interested call at my stalls and inspect my exhibit.

RUSSIAN SUNFLOWER MAKES GOOD SILAGE

Silage made from Russian sunflowers has attracted considerable attention in western Colorado and parts of Montana. All who have fed it are very enthusiastic over the results obtained. For dairy cows, sheep and beef cattle it is proving an excellent feed. G. S. Ray of the Colorado agricultural college has the following to say regarding the growing of sunflowers for silage.

"The yields obtained from sunflowers are much greater than from corn. Twenty to thirty tons per acre under irrigation are the ordinary yields for sunflowers while corn under the same conditions will yield but ten to twelve tons. In Montana, 25 to 39 tons of sunflowers per acre are reported. The Nevada experiment station harvested 23 tons of sunflower silage per acre, while corn in the same experiment made about 14 tons. On dry farms, sunflowers have produced from three to 8.5 tons of silage per acre.

"Sunflowers also seem well adapted to localities too cool for corn. They will make a silage crop in a shorter season than will corn. They may be planted very early in the spring; light frosts after the plants are up are not injurious.

"Sunflowers are usually drilled in three and a half foot rows with the plants three inches apart in the row. Planting is done with an ordinary corn planter or a grain drill. Where a grain drill is used, a sufficient number of feed cups must be stopped up to give the required distance between rows. On irrigated land, eight or nine pounds of seed per acre are used, while five pounds are sufficient on dry farms. Seed bed preparation, cultivation and irrigation are practically the same as for corn.

"Sunflowers are ready for the silo when the seed is in the milk stage. They should be harvested with a corn binder (or by hand if the acreage is small) and run through a silage cutter which will chop the plants into pieces one-fourth to one-half inch in length. To prevent spoilage, thorough packing in the silo is very essential. Ordinarily, no water must be added to the silage as the plants contain a sufficient amount themselves."

"DE WORLD DO MOVE"

By Carl Machold

"Marse, that big tractor edition of the Cultivator you gave me a while back sent me to "scratching" the long, long ago, in fact, 'way back yonder when I was a boy in beautiful Ohio, in the Scioto valley bottoms just south of Columbus," was the greeting the writer received the other day from an aged colored man to whom, after carefully reading it, he had given the 48-page tractor edition of the Cultivator.

Continuing, the colored man said: "My father and his family were taken to Ohio and given their freedom for saving the life of a boy whose name was John R. McLean and who afterwards published the Cincinnati Enquirer. One day, the owner of the broad, black field of corn we were planting, after reading the paper, handed it to me just as you did last week, Marse. It was the Ohio Farmer, published at Cleveland, by a man named Lawrence, a four-page farm paper. I was pleased to think that a rich man would give me, a colored boy, a paper to read, and I will surely always remember him for it. I read every line in that paper, advertisements and all. I have kept that paper all these years and occasionally read it over again. In the fall of the same year, 1848, the boss gave father and myself a ticket to the Ohio state fair at Columbus and gave me two half dollars to spend for myself. In one small tent I saw some fair editions of the Ohio Farmer, and the man in charge gave me several different copies and wanted to know if I wouldn't like to subscribe. My hand was tightly clutching the two half dollars in my pocket and my heart was in my throat, thinking of all I had intended to get for that money. I gave the man the two highly prized half dollars and received the paper for a year, and the next year at the state fair he remembered me and I subscribed again and still take it.

"The principal ads in that 1848 paper were for Morgan stallions. Implement dealers advertised "A" cultivators, plows, wagons, carryalls, etc. It was the horse ads that interested me most, and I will always remember the pictures and description of the "Flying Clouds, the Mambrinos, the Messengers, the Black Clouds, and even now when I read over my horse paper I note that even though they are all dead these many years their blood goes flowing on in the trotters and pacers of today. No sir, there were no Hambletonians mentioned. If I remember rightly, Rysdack's Hambletonian, the father of the American trotter, was foaled in New York state the next year after I read my first farm paper in 1848. And by the way Marse, I sent that tractor edition back to friends in Ohio and told them to subscribe for the best farm paper on the Pacific Coast."

BLASTING ALKALI LAND

Serious alkali conditions can be corrected, at least sometimes, by the help of soil blasting. Owners of soil that is showing this trouble should inform themselves of what may be done.

To make the matter clear, a brief review of what takes place when a soil becomes alkali is desirable. Two processes are responsible for the condition, both of which are products of cultivation. In the first place improvement in soil tilth and granulation improves capillary movement of water from deep in the soil to the surface, where some of it evaporates, leaving a crust of the salts it carried. If this process is allowed to continue unchecked by surface mulching the alkali is bound to accumulate to a damaging extent in a short time.

The second process is the rise in the water table in the ground, due to irrigation. In arid regions the level of standing water in the ground is far below the surface. Even if the subsoil contains much alkali it stays down beyond the reach of roots because there is no free water to bring it up. But when irrigation wets the under soil the alkali is dissolved and brought up to the root level, with serious results.

As is well known, these accumulations of alkali can be removed by leaching them out of the soil with plenty of water. To accomplish this, however, and to do it with two or three washings, or less, the drainage must be far better than the average soil possesses without special treatment. This is where blasting is of such help. It opens the lower soil and permits the water to filter away freely and at depths below the level of most roots. In consequence the top two or three feet of soil is made almost entirely free from alkali. Emphasis must be placed on this matter of blasting, lowering the level of drainage through the soil. Without it the free water follows through slowly, at only one or two feet under the surface, and there is not enough alkali-free soil above this level to feed crops.

In the broken subsoil the water is let in quickly. In it, also, the water level after the alkali is removed can be kept lower while still supplying crops amply, because capillary movement is so much improved, thus the danger of another accumulation within the root area is largely done away with.

White alkali should be leached out without preliminary preparation. Black alkali, of course, should be treated with gypsum if possible before the leaching is attempted, since the chemical change effects results in swifter removal and a cleaner job.

YELLOW OATS ARE "WHITE"

One of the features of the new federal oat grades which will become effective on June 16, 1919, is that yellow oats are classed as white oats and can take any numerical grade subject only to general appearance and the color requirements for each grade. This will permit yellow oats of good creamy white appearance to grade as high as No. 1, the United States department of agriculture states. The old standards in many cases prohibited yellow oats from grading higher than No. 3.

Regarding the economic value of cactus S. Fox writes that he thinks it has a great value as a gum yielding plant. He says that at certain times of the year after it flowers the leaves or lobes are full of sticky elastic juices.

Uneeda Glenn County Duroc-Jersey Herd

Our record of the past five years, the high standard we have attained, the number of high class animals we have distributed and the number of new breeders we have started, entitles this herd to rank as the

Key Herd of the Pacific Coast

Why do breeders look to this herd for new blood?

Why do farmers come to this herd for foundation stock?

Why has this herd been responsible for starting more new breeders than perhaps any other herd?

Here Is the Answer

For years this herd has been the largest winner at the leading fairs.

For years we have been breeding and selling superior Duroc-Jerseys. This commanding position has been attained only by hard work, large expenditures and the purchase of breeding stock from the best herds in America.

We are usually in a position to supply your wants and we take great pleasure in sending full particulars regarding anything you want to know.

SANDERCOCK LAND CO.

25 Montgomery Street San Francisco, Calif.

In Charge of Natomas Land Sales

Putting Berkshires Across

By Frank B. Anderson, Secretary, Western Berkshire Congress

WHEN the East begins to come to California for carload lots of pure bred breeding animals, it's a fair sign that the stock from this state must be pretty good stuff. That is what Eastern Berkshire hog breeders are doing, so we of the West pride ourselves a little on having some good seed stock out here when our pigs attract Eastern buyers who ship them to the Atlantic seaboard and into the Southern states.

This outstanding fact alone is something worthy of consideration on the part of the farmer or business man contemplating going into the hog business. The pioneers of the pure bred breeding game on this coast were obliged to send East for foundation stock. Many of them are yet doing it and will continue to do it in a small way, but the good selections made years ago by the beginners, who are the veterans of today, make it easier for the man now contemplating starting a herd. This not only applies to Berkshires but to other breeds of swine and to cattle as well.

Having orlginally stocked their farms with the best they could get in the East, the Western breeder set out to have something just a little better. Careful selection is the most essential duty of the breeder of pure bred live stock, and the Berkshire hog in California today is the product of that very careful selection on the part of the early breeders, plus the later day selections of the sons of great sires from the tops of the Eastern and Middle Western herds.

The above speaks a lot for this breed of swine in the West. I mean by that the Pacific Coast, as Berkshire progress all along the coast and into Nevada has been about the same. This was ably demonstrated by the winnings of the splendid herds from various Western points at the Panama-Pacific Exposition.

The pioneer work of the breeders of some years ago makes it easier, as I say, for the beginner of today, but present day breeders are going to make the game better for those who follow and those just venturing forth into the pure bred Berkshire hog business. The Western Berkshire Congress is the medium through which this breed promotion work is being handled in the West.

There are many ways in which the Western Berkshire Congress would like to push the breed a little stronger, but its membership is made up of farmers whose other duties do not permit them giving quite the time to this sort of work that they would like. However, the progress made during the past spring, through the holding of four so-called promotion sales, has been an achievement worthy of mention.

When A. B. Humphrey of Escalon, who made himself famous in Berkshire circles by showing the grand champion and reserve grand champion boar at the World's Fair, called his directors together upon being elected president of the Western Berkshire Congress and asked: "What are we going to do to put 'Berkshires on Every Farm' as the breed slogan calls for?", J. Francis O'Connor, owner of the Castleview herd at Santa Rosa, was ready with a real good suggestion. "Let us take our pigs to the farmer's front door and sell them to him at his own price," said O'Connor, and from this sprang the promotion sale idea.

Starting at Martinez in April, four sales were held, Dixon, Santa Rosa and Salinas being the other locations. In each town some local breeder looked after local arrangements and the officers of the congress joined in with what assistance they could give besides consigning real good hogs from their herds.

"We are not expecting a great deal of money for these pigs, but would like to get a fair price. I dare say that we will not come anywhere near getting the money for them, laid down here at your door, that we would at home." This is somewhat the remark President Humphrey would make at the opening of these sales, and it pleased the farmers. They saw that the Berkshire breeders were not out to force the sale of their hogs, but to give the farmer an opportunity to get started right in the pure bred business. He could see the hog in front of him and pay whatever he felt it to be worth.

As secretary, it was up to me to get entries for these sales, and I will say that it was a most difficult task. Many breeders keep sold out almost before the pigs are old enough to leave the sow, so it was hard scratching to make up some of the consignments, often taking from a breeder something he was keeping in his reserve herd. Pigs under breeding age made up 90 per cent of the consignments. In all there were 112 pigs sold in the four sales for $5414.50, or an average of $48.35. These pigs went to farmers in the country surrounding the town in which the sale was held.

Through the encouragement thus offered by the Western Berkshire Congress many of these buyers are going to become breeders. At every sale the farm adviser was present and urged the growing of better live stock. When it comes time for these farmers to put their pigs on the market as breeding animals, they will have the Western Berkshire Congress back of them. They can consign their pigs to our sales. It will not be necessary for them to do the pioneering that the older breeders have done who went East and bought and upon bringing their pigs to breeding age, had to get out and find the market for their breeding stock.

It has been suggested to follow these young pig sales with bred sow sales next year. This may be the consequence, and having watched the progress of the young "Berks," these same buyers will come back for mature animals and make a little better start. The few bred gilts offered in these sales were eagerly sought after, indicating the manner in which the farmer would like to establish himself in the hog business.

In order to raise money for carrying on the breed promotion work, the Western Berkshire Congress will hold a donation sale at the state fair at Sacramento upon the completion of the judging of the Berkshire classes, which will likely be on Tuesday afternoon, September 2. Progressive Berkshire breeders have donated a pig or two each, the proceeds of whose sale will go into the congress treasury to carry on propaganda work and the posting of special Berkshire classes at the fall shows.

With a good live breed promotion body back of him, the new breeder cannot go wrong by selecting Berkshires. If he has a warm preference for another breed, he should follow that preference, because a successful breeder must like his breed and must have his heart in his work.

What Is a Bull Worth?

By Frank D. Tomson, Secretary American Shorthorn Breeders' Association

THE value of a bull is usually considered in a general way rather than from the standpoint of the actual results in dollars and cents, strange as it may seem.

Recently W. A. Cochel formerly head of the animal husbandy department at the Kansas agricultural college, analyzed the subject in a way that simplifies it and leaves little argument for the defense of the use of any bull that is not a prepotent sire.

Mr. Cochel suggests as a basis that

the average bull will sire 100 calves in the course of his life. Many would sire two, three or four times that number, but for the sake of being sufficiently conservative he uses 100 as a basis for calculation. He draws attention to the increased value in the calves sired by the registered Shorthorn bull for instance over those from the same dams sired by a grade or scrub bull. If the increased value represented in the calves by the registered bull was $5 the actual value of this bull to the owner would be $500. If the increase was $10 the bull would be worth $1000. If there existed an excess value of $20 the bull's worth would be $2000, the interest on the original investment being the only increase in the cost over the poorer bull.

There are so many instances where the actual value of the get of a good bull exceeds the value of those of a poor bull by $50 per head, even from grade cows, that it suggests that we have really failed to comprehend what a good bull is really worth. This is not written to urge farmers to go out and invest one, two, three, or four thousand dollars for their bulls but to draw attention to the actual safety of the investment if they actually did do it. The price paid doesn't determine the real merit or value of a sire but it is rather an impressive fact that worthy bulls as a rule do command fairly liberal prices. Even when they are sold as calves there is usually some buyer who foresees their outcome and prospective value and is agreeable to paying the price. This doesn't always apply by any means for many a valuable bull has slipped through a sale at a fraction of his worth because the bidders were not then looking for bulls. Many a man has sat in a sale and allowed good bulls, the sort he needed, to sell for a song because he had a bull at home. He failed to consider that his bull should go to the butcher or at least be kept away from the breeding herd. He just knew that he had a bull and what would be the use of two bulls in his small herd. Of course if this bull was dead or past usefulness then he would need another, but while he lived and was able to do service, regardless of his lack of merit, the owner wouldn't think of buying another however valuable the bull and however low the price.

This happens day after day and nearly everywhere. It doesn't seem to matter that the poor bull could be sold to the butcher for as much, or nearly so, as the good bull would cost. Here is an expression that one hears in public sales times without number —"Oh, I've already got a bull an' what's the use of havin' two bulls?" Merit isn't considered. Value is overlooked. The fact that the bull in question might add from $5 to $50 to the value of every calf he sired is ignored. Maybe it is the feeling of comradeship that has grown up between the owner and his bull which makes him so reluctant to part with him. Perhaps that is the reason, yet I have a notion that it is the owner's lack of business alertness that holds him back and keeps the old bull on duty. Whatever it is it seems to be always with us.

On the markets every day steers of the same fatness will show a difference in selling value of from $5 up to $150 per head. Why? Principally because of the kind of bulls that sired them. Nor does this spread in the price take care of the gains and the feed consumption. Here again the kind of sire is the determining factor. In the business of producing beef there is a lot of credit that rightfully goes to the good sire and there is a lot of grief and lack of profit that has to be charged against "Old Colonel" or "Spotted Dick" or "Baldy" or "Black Jim." It's a long list, these unworthies. They have outlived their deserts. They were never entitled to the place accorded them. And today when the feed bills mount high and the range of quotations at the markets is so wide their owners recognize that they have been expensive.

This is the day of the better types. There is profit in no other for the producer. The pure bred sire possessing size and quality is the only solution of the farmer's problem. A little increase in value on each calf makes the better bull not only worth while but, under the prevailing conditions, an absolute necessity. We are past the period when we were trying to make a bare living on the farms of this country. We are in business for profit now and the land we till and the types of live stock we employ must be considered in the light of an investment for this purpose. We don't buy bulls to save money but to make money. And when there is such a wide range of value in the sire shown by the few dollars on each calf we may well get our attention on the bull that will sire the kind with the added value.

UNPROFITABLE FENCE

Bronte A. Reynolds, editor of the bulletin of the state department of agriculture, suggests the use of a space ordinarily occupied by a fence and its accompanying weeds as having possibilities for profit instead of being a pest distributor:

The average type fence does not permit of cultivation within a given distance on either side. In the area thus protected by the fence thrive sufficient noxious weeds and grasses which, unmolested, develop the seed to be sown by wind and other agencies from season to season. Upon these weeds, when in a green, succulent stage, a large number of our destructive insect pests feed, reproduce and hibernate, and from these locations as foci are dispersed into the adjacent cultivated crops to wreak their toll of damage with which we are already too well acquainted.

I can produce a hundred works on destructive insects, many with illustrations of fence rows, and show under "Control Measures" and "Repression", the admonition that adventitious growths, such as weeds, grasses, etc., protected by fences, be cut, burned or otherwise destroyed in order that insects and weeds which ordinarily would be destroyed by cultivation shall find no hibernating refuge along the fence line.

The nearest approach to a practical solution for "doing away with this untilled area" involved by the average fence line was the novel but impractical suggestion of a "movable fence." The suggestion recommended was moving the "movable fence," plowing or cultivating, and then putting the fence back.

Now a fence has many functions. It keeps your own stock in; it keeps your neighbors' stock out; it protects your orchard, your farm and your vineyard, and, most important of all, usually it establishes the legal boundaries of a given estate; and for this last reason, as old and sound as Magna Charta, the movable fence is impractical, for it would entail vexing legal difficulties.

Now as a matter of agricultural fact what else beside a few berry bushes or weeds ever occupied the uncultivated area protected by the fence? Nothing of commercial importance! Then why not "sterilize" this unproductive area, since it serves no agricultural purpose but to enclose and protect the environed land?

Thus we are confronted with the paradox wherein we build a fence to protect our crops and by so doing perpetuate broods of insects and noxious weeds, which cost more in wasted energy and actual losses than many other sources combined.

Now after many years of recurrent losses, let us take this fence problem and settle it for all time by chemically sterilizing this strip of three or four feet, in which nothing of value is produced, and in so doing wipe out both weeds and insect plagues that from time immemorial have been fostered under its benign influence.

A Word About Chemicals

Crude oil, salt and other weed killing preparations have disadvantages which preclude their wide use as sterilizing agents, since only partial success has followed their application, and at this time no more promising agent is available than some of the many types of arsenical poisons. After a given time no danger of stock poisoning would be entailed since nothing would grow in the poisoned fence-row area upon which stock would be tempted to feed.

Sterilize the fence row and save next year's crops from weed and insect losses.

The World's Champion Herd

REGISTERED HAMPSHIRES

HERD SIRES---Honest Lad, Goldmine and Prince

embracing the blood lines of Hawkeye Lad, Gen. Tipton Again, Sioux Queen and Pat Maloy.

Following is partial list of brood sows in herd, all of them "repeaters": Fern Winifred, Empress, Mabel, Freda, Direct's Model, Ferndale Goldie, Queen Elizabeth, Judith and California Sioux. This fine diversity of blood lines covers the entire breed. Two hundred pigs for the season's trade. Bred sows and sows with litters at foot for sale at all times. Visitors always welcome.

A post card to the Secretary will bring a catalog.

LACTEIN
CONDENSED BUTTERMILK
FOR HOGS AND POULTRY

BUTTERMILK IS NATURE'S FOOD AND TONIC

Lactein is pure buttermilk as it comes from the churn, pasteurized, super-soured and condensed. It contains all the health giving food and tonic values of the original buttermilk without the useless bulk of water. On account of its high lactic acid content it will keep almost indefinitely.

Lactein is now recognized as one of the most necessary food digestive agents known for both growing hogs and poultry, due to the large amount of lactic acid it contains. The lactic acid aids digestion and assimilation causing the hog or fowl to digest all the good from the grains given them to eat, and to eliminate all the dead and disease matter from the digestive organs, thereby promoting growth and preventing disease. Lactic acid is considered the best tonic, appetizer, liver and bowel regulator known for hogs and poultry.

COSTS LESS THAN 2c PER GALLON TO FEED

One gallon of Lactein mixed with thirty gallons of water and fed with the usual grain feed will show greater gains than from feeding the grain alone, besides it will keep the hogs and poultry healthy and their appetites keen.

If your dealer does not handle Lactein, write us for our booklet and prices.

Vigor---The Magic Word

By Jean A. Koethen

WE have been looking for years for the one word which should prove the open sesame to poultry success Sometimes feeding has seemed to be the word; again the changes have been rung on breeding. Some enthusiasts would have us believe that culling is the thing, and again we are told all depends on selection of the proper type. It remained for Professor Dougherty, during his recent visit south, to put into words the latest thought on this important subject when he said: "The first requisite to egg production is a machine of proper capacity, and the first essential to securing egg production is therefore constitutional vigor." More weight attached to this opinion because it was enunciated in a lecture on feeding. "The most important problem poultrymen have to face," he declared, "is to positively eliminate the low producers and build up the high producers," and the high producer is, in the last analysis, the most vogorous bird. In other words, if we can build up a strain of birds that are never sick, hens that do not develop roup whenever a draft blows on the back of their heads or have bronchitis when they must walk on wet ground for a day or so, hens that can eat large amounts of food without getting indigestion, that are still fat and husky after a year's steady laying and that can go on laying heavily for three years or more without breaking down, we have the foundation for the very highest production.

Helen Dow Whitaker of the Washington station, recently expressed herself very pointedly to the same purpose: "High egg production is the result of a trinity of forces, vigor, happy environment and the breeding pull for eggs concealed in the invisible cells of the reproductive organs of the ancestry, both male and female, I think, together with the ability of that ancestry to pass this factor on, laying eggs, for the pullet, is a matter of good eyesight, heavy feathering, active circulation, a normal liver, a clean, energetic digestive tract, a good respiratory system to eliminate poison from the body, and space in the bodily cavity for handling a raw product—food—and making it into a finished product—eggs. All those must be combined with a certain vital factor of which we know all too little, namely, the cellular activity of the ovary in the development of the embryonic yolks."

Mrs. Whitaker scouts the idea of picking layers by measurement of body or color of legs, declaring that "To say that eggs are a question of body type is to say that the shape of a factory determines its output. Brass tacks, so far as I know, can be made in an oval or rectangular or square factory so long as there is space, and above all, the machinery that makes brass tacks. Just so the ability of a layer is not determined by bodily conformation but by machinery within for the manufacture of eggs and by possession of the vigor necessary to operate that machinery to its maximum capacity."

There is, to be sure, a type of hen that stands for vigor, the deep-breasted, long backed type, deep in the keel, rather short in neck and beak, and with a neat, smallish head. The type is the same for hens and cows and goats and human beings, and when we select for vigor we inevitably select such birds.

It is possible, of course, for a naturally vigorous bird to have its vigor sapped by disease and still maintain the general appearance of a healthy, vigorous bird. Tendency to roup and other respiratory diseases is doubtless passed on from generation to generation by the use in the breeding pen of birds that have once or perhaps repeatedly had colds or roup. It is all right to say a hen may have a cold and still recover perfectly from its effects. Maybe she does, but there is not much excuse for hens ever having either roup or colds, and if only birds that have never had the slightest cold are used for breeders there will be no colds in the flock. A vigorous hen no more minds a draft on the back of her head than a vigorous perfectly normal human being minds it. Sensitiveness to drafts and to dampness and weather changes simply indicates that vigor has not been the basis of breeding. It is possible to breed a strain of fowls so vigorous that you can only kill them with a club or a hatchet.

It seemed to me a pity that at the poultry school in San Gabriel last May one of the eight sessions should have been devoted entirely to diseases and their treatment. I would far rather have seen it devoted to prevention of disease. The time is coming when we shall all be ashamed to be sick or to have any one know that we have sick fowls.

Vigor depends on two forces, breeding and environment. The most vigorous fowl will degenerate in an uncongenial environment, but the most wholesome environment never made a silk purse out of a sow's ear. There must be external conditions that give nature a chance and internal characteristics that are worth a chance.

Breeding for vigor means selecting the most perfect. It also means eliminating the imperfect, and elimination begins as soon as the chicks are hatched. Weaklings should be killed at the start. Chicks that lag behind in their development should be culled out for broilers. The sooner every backward chick is out of the way the better. Cull out those that feather too slowly and the stunted-looking ones. If only vigorous chicks are allowed to reach maturity the later task of selection is greatly simplified.

A "happy" environment, to use Mrs. Whitaker's phrase, includes comfort, cleanliness and suitable food.

To be comfortable chickens require shade in summer and protection from rain and wind in winter. Mud under foot is not comfortable, not for long at any rate. Lice do not contribute to comfort. Mite-infested nests and roosts, bare yards, lack of scratching litter, hard floors with the roosts too far above them, too narrow roosts or insufficient room upon them, all these are little things, but like the constant drip of water on rock they wear away vitality and gradually sap the powers of resistance.

Under cleanliness we include everything connected with sanitation—clean air, clean water, clean yards and droppings-boards, clean feed. I do not know how much walking constantly on manure affects the vitality of a fowl, but I do know it produces scaly-leg, and scaly-leg does in time affect vitality. I do not know just how long hens can roost in badly ventilated houses without developing roup. Doubtless it depends on the vigor of the individual. But I do know that sooner or later some of the flock will suffer from such abuse. It is the continual dropping that after awhile wears away the hardest rock.

"A happy environment." I like that phrase. It reminds one of the companion phrase "contented cows." It means that the hen is always able to be at her best, never worried, as such a temperamental creature is sure to be by little nagging discomforts that care would alleviate. It means that she does not need to waste vitality and energy in fighting vermin and colds and heat. Do you know what that phrase especially means to me? It means for this climate a moist dust bath under a shady tree. That is the happiest environment for a hen.

To a certain extent feed may well be included under environment, for, while the food which produces eggs is no great factor in a hen's happiness, as much as is necessary to the maintenance of health is a great factor. I doubt if any hen is happy without green feed, and if she is denied it her liver will suffer sooner or later. A vigorous bird can stand unsuitable food for a while, but not forever, and when the digestion is impaired all is lost. Give the hen the right ancestry, suitable surroundings and the feed that will maintain vigor ,and you need not worry about production.

Watch your step—breed, weed, feed, then gain speed.

AMERICAN EGG LAYING CONTEST

Entries are now being received for the 1919-1920 American Egg Laying Contest at Leavenworth, Kansas, which will begin November 1. All entries must be in by October 1 and the pullets must reach the contest October 15 to 20.

During the month of June, one pen of five Brown Leghorns from Indiana made a record of 149 eggs in 31 days. This, the contest managers believe, is the best pen record ever made. During June, 38 of the 63 pens contesting produced 100 eggs or more. Eleven pens produced from 125 to 137 eggs.

Seventy hens each produced 25 or more eggs during the 30 days of June. One hundred and eighteen hens produced less than 20 eggs each, while eleven did not lay an egg.

The most interesting column among the various statistics given for the eight months ending in June is that showing the performance of the average pullet of the different breeds. The best average, we are not surprised to learn, was that of the White Leghorns, 142 eggs. It is a little surprising to note that the second highest average was made by White Orpingtons, their average reaching 134. Barred Rocks are next with an average of 128 eggs; then come Buff Minorcas with 125 eggs, White Wyandottes with 123 and Anconas with 122. Buff Orpingtons come at the bottom of the list with an average of 87.9 eggs.

Professor Palmer of the American Poultry School, at which the contest is being held, recommends two meals of moist mash per day for layers. He also suggests that a few fresh green beef bones be thoroughly boiled three times a week, and the soup used for moistening the mash. The rest of the time milk or water is used.

A PROFITABLE WINTER HATCH

Mrs. H. J. Clewett of Upland sends us the following interesting account of her amateur experience with 40 hatchery chicks:

"Last December we bought from a hatchery 40 White Leghorn chicks. An accident lost us eight and we started well with 32. Home-made hover with no artificial heat, small pen in the cover crop, plenty of fresh water, food of a commercial chick mash with buttermilk and chick feed before them all the time; this was their lot the first month. Then I began to add wheat, changed at two months to a commercial egg mash with buttermilk and gradually added Egyptian corn. By this time they were running in the grove.

"Being a busy woman I always put out feed enough to last 24 hours. They would be eating as early as 4 o'clock in the morning, were always hungry, crops always full. If you please, we had 16 pullets and 16 roosters. Sold most of the roosters in February. In March three brought $1.20 apiece.

"On April 9 at four months and one week old a pullet laid the first egg and it was double-yolked. During April they laid 100 eggs; in May, 171; in June, 239. Today (July 1) I balanced their account and find to their credit $1.66 and 15 pullets (one was caught by a coyote) and one rooster, just seven months old. I am proud of them."

Please note that these chicks ran on the cover crop in the orange grove, and that while they were given the least attention consistent with due regard for their health, they had before them constantly the three things chicks need most, a good dry mash, buttermilk, and green range. The time will come. I hope, when every cover crop will have its flock of chicks.—J. A. K.

RABBIT GROWERS MEET AT STATE FAIR

On Tuesday at 9 p. m., September 9, the Rabbit Growers Association of California will hold a get-together meeting in the Directors' Meeting Room of the new Agricultural Building at the state fair grounds.

The intent of this meeting is to arrive at more definite plans concerning the rabbit growing industry, which is destined to become one of the meat producers of the United States. Very little is generally understood concerning utility breeds of rabbits which are very prolific and easy to raise.

Poultry Queries

Conducted by J. A. Koethen

Leg Weakness

I have six pullets four and one-half months old with weak legs. Some have the trouble in both legs, one in one leg only. One's wing drops down and hangs under foot. Can you give me cause and a remedy? My pens are dry, well ventilated and clean. The pullets are nearly ready to lay. Also can you tell me where I can get a good grade of carbolineum. I have tried a number of large paint firms and cannot find anything with the proper kick in it.—Subscriber, Hayward.

Is this weakness or lameness? There is a difference, you know. Do you notice any swelling in the leg joints? Any loss of weight or darkening of the comb? Lameness combined with loss of weight suggests tuberculosis, but this disease can be diagnosed only by the tuberculin test or a post mortem. If on killing and cutting open an affected bird, you find liver, spleen, intestines and the membrane uniting the intestinal folds studded with yellowish white cheesy nodules of various sizes you will have good reason to think the bird was suffering from tuberculosis. If you wish to try the tuberculin test write Dr. Beach, Poultry Department, College of Agriculture, Berkeley, for tuberculin and directions for using. The tuberculin is injected into the comb and wattles. If it produces a swelling, tuberculosis is indicated.

It is possible your pullets are suffering from close confinement and lack of animal food in the ration. Your dry mash should contain both beef scrap and bone meal. If they are up to normal weight it might be well to improve the ration before trying the tuberculin test. That drooping wing may be due to some injury and have no connection with the general condition of the pullets.

You should be able to find a good grade of carbolineum at any large poultry supply house. If you do not, crude carbolic acid diluted with kerosene or distillate, one part carbolic acid to five or more of the oil, will answer the same purpose.

Ration has Too Much Protein

Please tell me through the Cultivator if there is anything wrong in the way I have been feeding my chickens. From the time they were about six weeks old I have kept a dry mash before them all the time, consisting of, by measure, one-half part corn meal, one part bran, one-half part barley meal (hulls sifted out), one part ground oats (hulls out), one part beef scrap, one alfalfa meal, one-quarter bone meal and one-quarter charcoal. Besides this I feed Crowley's growing mash damp mornings, green stuff at noon, a wet mash of equal parts bran, oats, corn and barley meal at four o'clock and grain at night. The roosters are four and one-half months old and weigh barely three pounds. They are kept by themselves in small yard, look well and eat lots but it seems to me they do not fatten very fast. Have Reds and Rocks. Is chopped raw potato good for them?—Subscriber, Lakeside.

It would be better to omit the bran and the beef scrap and bone meal from your fattening ration. Try this formula, which is used at Purdue and is a fair sample of the ration used at all experiment stations: Two pounds corn meal; one pound shorts; one pound ground oats; eight pounds buttermilk. If you have no buttermilk or sour milk you will have to moisten the ground feed with water, but birds make more rapid gains when they have milk. This formula is intended for crate fattening but may be used when the birds are confined in a small pen. Feed three times a day all they will clean up in 30 minutes but do not continue the ration longer than two weeks. See that the cockerels are free from lice and that they have grit always before them. The chopped raw potato is all right, but it would probably help more in adding weight if it were boiled and mixed in the mash. The ration you have been using is too narrow. That is, it contains too much protein and not enough starch and fat for rapid fattening.

Chicken Pox or Gapes

I saw an article in the Cultivator of August 16 about disease of chickens. My chickens are troubled like those, but that disease is not the chicken pox. It seems somewhat like the gapes to me. I have lost 100 chickens. Some of them are two months old, some younger. It starts in the eyes. They close up and go blind. The blisters are not like the chicken pox. Chicken pox forms a dry scab and if you mix vaseline and kerosene together and keep them greased they will get well. But this disease is different; it comes on with red blisters and the eyes go blind. They gap a little, not much, and a watery fluid discharges from mouth at times.—Subscriber, Merced.

I am very glad to hear more about this disease, but I still think it is chicken pox, only a more severe form than common. See how this description of the disease, as given by Freiberger and Frohner, compares with the eruption on the heads of your birds: "The favorite seats of these warty nodules are those parts of the head that are not covered with feathers; root of the beak, neighborhood of the nostrils, angles of the mouth, lobes of the ear, wattles, edges of the eyelids and especially the comb. They sometimes spread over the feathered parts of the head, throat and neck. At first they appear in the skin as flat nodules, which soon become prominent, and which vary in size from a poppy seed to a millet seed. Later on they usually attain the size of a hemp seed. They are of a reddish gray or yellowish gray color, and are rather firm to the touch. Their surface soon becomes covered with a dirty gray, yellowish brown, or red brown crust. They vary in size according to their age, and frequently lie rather close to one another, so that the affected parts look as if coarsely granulated. If the edges of the eyelids are affected by these tumors the lids will become nodular, swollen and closed. If, as sometimes happens with pigeons, the eruption of nodules extends over the whole skin of the eyelids and its neighborhood, the entire eye will become covered with mulberry-like proliferations of various sizes." When chicken pox affects the eyes and the birds become blind, they often die from starvation. The use of iodine on the sores, as previously recommended, may be followed by greasing daily with vaseline or lard.

If after reading the above description, you are still satisfied that chicken pox is not the trouble, try washing their eyes two or three times a day with two per cent boracic acid in a decoction of chamomile flowers. This is a preparation any druggist can put up for you. Drop the medicine in the eye with a bit of absorbent cotton, wiping very gently if necessary to remove the sticky secretion. If this is not chicken pox it is roup of the eyes, which may or may not be accompanied by diphtheretic membranes in the throat. This would account for the gaping and the running of a watery fluid from the mouth. These membranes occur with both chicken pox and roup, and may be treated by swabbing with peroxide on a bit of cotton.

To keep fowls in good health and productiveness during the summer months we have found it advisable to make a few changes from the plan of feeding adopted during the cooler seasons. Heating feeds, such as corn and barley, should now be left out of the diet, and the best feeds at this season of the year are bran, oats, a little wheat, and as much green stuff and vegetables as the fowls will eat.

Dump ashes in the chicken yard. The hens like to work them over and pick out the coals as well as wallow and dust themselves.

LOOK FOR THIS SIGN

MONARCH TRACTORS

Find Out the Truth For Yourself

For your own interests, before you place an order for any other make of tractor, assure yourself that your conclusions are correct about the Monarch by putting your questions to us face to face and examining the NEW MONARCH. We will put you in touch with men who are using this wonderful tractor. Men that have looked twice before buying.

The time has come when every farmer and power user must own a tractor. The cost of production is the grand regulator of farm produce prices as well as other things. If you can't produce as cheap as the other fellow, you will lose out, even though you may toil from the break of day until late at night, while the other fellow has his hours of pleasure and seems to take life easy with his iron horses.

And it must not be necessary to ask yourself, — Can I get accross to that field over where I want to work, or can I work the field when I get there? Small farm or large farm, efficiency and service demand a track-laying machine — one that will work rain or shine, any day in the year on loose plowed and cultivated ground or elsewhere.

Finally, it must be reasonable in first cost and low in upkeep cost.

Call at our exhibit and get authentic upkeep costs.

THE GREATER HAPPINESS

I reckon when life is done
And we look back across the years
To see the goals which we have won
And count our varying smiles and tears
The greatest joys that we'll recall
Will not be those of skill or might,
But children romping in the hall
And little games we played at night.

The big things, when our life is through
Will be the little ones of now;
We'll prize those moments in review
When never was a troubled brow,
When eyes with love were all aglow
And mother sang her lullabies;
Those restful, happy scenes we know
At night when moon and stars arise.

I fancy none of us will yearn
To fight our battles once again;
Or would unto this world return
To triumph o'er our fellow men,
But we might brave the ways of earth
And live our many trials o'er,
To hear our children's shouts of mirth
And romp with them upon the floor.

We shall not value glory then
Nor think of wealth as now we do;
We'll prize those glorious moments when
Contentment and delight we knew.
And looking back across the years
The merry scenes of home we'll see
Through eyes bedimmed by crystal tears,
And wish such joy again could be.
—Edgar A. Guest.

GOING ON OR GOING AROUND

"SEE that little fellow," said the professor, pointing to a sparrow on top of the horse-rack. The bird was tugging at a long hair caught there from Betsy's tail.

"Thrifty little builder, eh?" answered Farmer Hills. The Farmer and Professor were smoking the usual after-dinner pipe under the big elm.

"She certainly works out a fine interior finish with that hair," the Professor agreed, "but I am wondering about her thrift."

Farmer Hills didn't answer but continued with his own idea. "A little later the squirrels will begin at dawn and work all day putting away their winter food—they are real examples to folks."

"That's true as far as they go," again agreed the Professor. "My grandmother was a Scotch Presbyterian and terribly saving. When mother poured the clotted cream over my oatmeal, she would frown and say, 'Scotch bairns grew strong on plain porridge.' The Professor stopped to chuckle over the recollection. "She taught me, 'How doth the little busy bee' and told me over and over again the story of the thrifty grey squirrel.

"That sparrow over there, will work just as hard to build a nest next year. If he were really thrifty he would put a rain-proof roof over his nest, and next year he would be building houses to rent. But he never gets ahead, he will be doing the same thing a hundred years from now."

"And the squirrel?" asked Farmer Hills.

"Same with him," said the Professor, "works all the summer putting away more than he needs. The nuts rot, and he starts all over again the next summer. If we had copied the squirrel, we'd still be cave dwellers."

"But I raise a wheat crop every summer." For Farmer Hills was not entirely convinced yet.

"What do you do with it?" the Professor asked.

"Do with it!" repeated Farmer Hills. "I grind up a year's supply of flour, put away enough to sow again, and sell the rest."

"And what becomes of the money?" pursued the Professor. He knew well enough that Hillcroft was the richest farm in the valley, that it had grown richer with each generation of Hills, and that it would again be passed from father to son, richer than when the father took it. The Hills regarded the ownership of land as a sacred obligation. So the professor knew what answer to expect.

Farmer Hills began, "Some of my wheat money runs the family, some of it is put by for up-keep and new machinery, and a good bit always goes into safe investments for ma and me. For two years I have put it in Liberty Bonds and Savings Stamps. I am buying now at the market price every Liberty Bond I can afford and I have the limit in War Savings Stamps. I figure that ma and I will be ready to turn the farm over to the son in five years and take that trip around the world."

"Not a bit like the squirrel," and the Professor was chuckling. "You keep going on and he keeps going around.

"Thrift is a deliberate thing. It marks out the real difference between human beings and animals. People progress and animals stand still. It takes genuine human thrift to go on."

HOUSEHOLD QUERIES

Bleaching Flour Sacks

In response to request in recent Cultivator for best method of bleaching letters on flour sacks Mrs. W. H. McCain of Monrovia writes:

"The best method I have found is to take some kind of washing powder, dissolve and spread over the letters. Put over that coal oil, roll up tight and soak overnight. Rub on the washboard in the morning. Boil in lots of strong soapsuds.

I have the best of success, all the print comes out this way."

Mrs Albert Waknitz of Thermal writes: I note your request for bleaching and removing printed matter from flour sacks. I use the following method:

First wash the flour from the sacks in cold water, wring out moist, then sprinkle printed side freely with kerosene and roll up for 24 hours, then with lukewarm water and rubbing with laundry soap on printed side, rub with printed side on washboard and the color comes out as freely as dirt. I bleach by hanging them out wet in the sun. One can dip them often or turn hose on them.

W. J. Gempshorn, Imperial: Saturate the sacks in kerosene two or three days. Wash in luke warm water and castile soap. If the stain is not all gone, use a little salt, lemon juice or citric acid. Bleach as usual.

Mrs. E. E. Booker, Saticoy: Your article in August 16th issue on bleaching flour sacks noted. I used to bleach your method, but now have a more satisfactory way, so write it:

Thoroughly wet all letters and colored parts of sacks with kerosene and let stand awhile. Then put in cool suds; soap and rub well, then put in another suds with some washing powder or sal soda and boil well. I usually let them stand a day or two in boiled water, then hang up in sun,—without wringing.

Mrs Helen W. Bullock, Redlands: Replying to an inquiry in your August number as to how to bleach flour sacks, I submit the following directions which have given satisfaction: Put sacks, ripped apart, into enough boiling water to cover them, add one-half cup kerosene, one and one-half cups sal soda, and one-half cake fine cut soap. Boal and steam for one-half hour, wash, rinse, and hang on the line in bright sun. If color is not all out after hanging in sun one day, dip in clear water and give another day's sun bath. When whitened, baker's 100 pound sacks resemble linen.

CORN AND FISH CHOWDERS

Chowders seem to belong to cold weather, but are none the less tempting for the cooler days of late summer and fall, for the evening meal after the heat of the day is past, or for the occasional picnic outing.

Now is the time for Cultivator readers to enjoy especially fresh corn chowder. Here is a good recipe:

Cut fat fresh or salt pork in dice and brown in kettle. Slice on top a thin layer of onions and a thick layer of diced potatoes. Brown in the fat, then add fresh corn cut from the cob, add pepper and salt and a tablespoon of sugar. Cover with hot water, put top on kettle and cook slowly for half an hour. Add cup of hot cream, sweet or sour, or milk and serve.

Fish Chowder

Put four thin slices of salt pork in the bottom of the chowder pot, then a layer of sliced potato; cover with a layer of fish, dust with pepper and salt and dot with lumps of butter. Proceed in this way until two or three layers of fish are used, then add a tablespoon each of chopped parsley and a heart of celery. Pour over a pint of boiling water and cook gently 20 minutes, then add a pint of hot milk, or, if better liked, the same amount of strained tomato juice.

ONE OF TODAY'S MIRACLES

Mr. Jones—The days of miracles are over. They can't turn water into wine now.

Claim Agent—That's where you're wrong. Why any railroad in our country performs a greater miracle than that almost every day.

Mr. Jones—How's that?

Claim Agent—When a train runs over a scrub cow and she becomes a fine Jersey.—Judge.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

ARCADIAN

Sulphate of Ammonia

A ton of ARCADIAN Sulphate of Ammonia carries more plant food than a ton of any other nitrogenous fertilizer.

ARCADIAN Sulphate of Ammonia is the well-known standard article that has done you good service in your mixed fertilizers for years past. Especially kiln-dried and ground to make it fine and dry. Ammonia 25¼ per cent. Made in U. S. A. Arcadian is the great American Ammoniate.

TAKE CARE OF THE FEET

Ordinarily speaking our feet that we expect so much of are left mostly to take care of themselves, and the feet get even with us and show their resentments in corns and bunions, and we suffer accordingly discomfort that with a little daily care might have been avoided.

Frequently calloused places form on the soles of the feet from standing or from lumps in the sole of the shoe. If the latter, the matter should be attended to by the shoemaker who can easily remedy the defect. The daily use of a rather coarse piece of pumice stone prevents these formations, and a file may also be used to rub off obstinate places. If these do not keep them down, paint each with a little tincture of iodine, and if you have a bunion that is sore apply iodine with a brush every night until all the soreness is gone, then wash the bunion every night with strong salt water.

Wearing one pair of shoes in the morning and another in the afternoon rests the feet wonderfully, and nothing is more restful to tired feet than the salt water bath. Some people find more comfort from rubbing the feet with dry salt than from using any other remedy. If one must take long walks or stand much a little dry boric powder sprinkled in the shoes every morning makes the walking easier and adds greatly to comfort.

If the feet are moist and tender wipe them every morning with a saturated solution of boric acid. Let it dry on, then use the dry powder in the shoes. This checks perspiration and destroys the odor.

The surest prevention against all foot troubles is a foot bath every day, a change of stockings and a change of shoes as often as possible.

A chiropodist says that the feet are the greatest nerve centers in the body and that when they become irritated and hurt it shows plainly in the face and makes wrinkles come long before they should. Rubber heels save the jar to the spine of heavy walking, especially if the person has a habit of bringing his weight down chiefly upon the heels.—A. M. H.

WHY SOME FARM HOMES ARE ABANDONED

"The main reason why so many farm homes are abandoned is because of the lack of modern labor-saving devices," says Miriam M. Haynes of the Colorado Agricultural College.

"Women are the determining factor, they rebel against the drudgery and hardships of the average life on the farm. The burdens of the farm life fall too heavily upon the home-maker who too often is trying to keep house in an unsanitary, inconvenient home with little, or no mechanical helps. If we are to build permanent homes in the country we must make our homes more comfortable and convenient, or in other words more "livable." We must bring the best of the home labor-saving equipment from town, install it in our country homes.

"Water in the farm home will mean much to the wellbeing of the entire family, it will relieve nine-tenths of the drudgery of the routine of the farm home work.

"When the average farm woman is asked what she most wants, her reply is nearly always, 'Water in the home with a well equipped bath room and plenty of hot and cold water the year around'."

"Let our aim be that we will install some kind of water system in the farm home before another winter."

THE BLACK HAND

"Our whole neighborhood has been stirred up," said the regular reader.

The editor of the country weekly seized his pen. "Tell me about it," he said. "What we want is news. What stirred it up?"

"Plowing," said the farmer.—Driftwood.

NOT A REQUISITE

"And do you have to be called in the morning?" asked the lady who was about to engage a new girl.

"I don't has to be, mum," replied the applicant, "unless you happens to need me."—Yonkers Statesman.

Fairbanks-Morse Quality—Very Low Price

This 40 light "F" plant is shipped completely mounted on one base. The power plant is our famous "Z" throttling governor engine which, in addition to operating the electric light and power plant, can also be used to furnish power for washing machine, churn, cream separator, etc., independent of the dynamo, either direct or through a line shaft.

Every part is Fairbanks-Morse quality—design—workmanship—materials. Instrument board is conveniently mounted over the dynamo. Low speed engine and ball bearing dynamo assure long life, less attention, and lowest possible maintenance cost. A touch of a button starts this wonderfully efficient outfit, and simply touching another button stops it.

Your dealer will prove its reliability, point by point, so see the Fairbanks-Morse "F" light plant before you buy any.

Citrus Markets

Los Angeles, August 27, 1919.

Picking and shipping has stopped account of strike. Some cars are on track and some fruit in house which may be a total loss unless strike is broken. Eastern situation is very satisfactory and the small amount of stock in transit and in storage will soon be exhausted.

Lemons are commanding only fair prices though Eastern weather conditions generally favor free movement of the fruit.

Shipments

Shipments of citrus fruits to date since November 1, 1918; Southern California: Oranges, 30,770 cars, lemons 8756, total 39,526. To same date last season; oranges, 3155, lemons 5148, total 18,303. Central California this season; oranges 4427, lemons 354, total 4781. To same date last season; oranges, 2539, lemons 115, total 2654. Northern California; oranges, 244, lemons 2, total 246. Last year same date; oranges, 203.

Philadelphia: 8 or., 1 lem. Val. 2.55-5.80, lem. 4.45.

MARKET NOTES

Early plantings of celery in the central part of the state will be ready for shipment by the middle of October. Late plantings are now being completed.

Talk among growers indicates there will be very heavy plantings in the Imperial Valley, possibly 4000 acres. In view of the fact that the yield was very short the past season such an acreage, representing a 65 per cent increase, would mean at least double last year's volume if yield is normal.

The supply of onions is short on the Los Angeles market.

Potatoes on the Los Angeles market jumped 40 to 50 cents per hundred weight on Tuesday because of heavy local and suburban demand owing to railway strike.

Supplies of fruit and vegetables have been tied up in freight yards in Los Angeles, but local market prices have been kept level by the large quantities of locally produced stuff which must be marketed at home because of the strike.

The bean crop of the United States will show a decline of 5,000,000 bushels from last year's production. California's output is estimated at 3,000,000 bags.

Several potato producing sections report that if they can not get transportation for their product they will let it rot in the ground rather than pay the expense of digging and have them rot for the lack of transportation.

It is reported that two large wholesalers of Los Angeles and San Francisco have already secured several good-sized boats for the purpose of shipping potatoes and onions to Los Angeles and San Diego to prevent a heavy shortage which will take place in a week or ten days if the present tie-up continues.

Tuolumne County has the honor of being the latest county to appoint a horticultural commissioner. H. T. Shaard is commissioner. In addition to acting as horticultural commissioner he will act as farm adviser and bee inspector and will also be given charge of the class in agriculture in the high school at Sonora. He surely has some job.

"An Inspiration to the Modern Stockman"

That is what one of our visitors said on going through our new factory. "It is an inspiration to me—the magnitude, your improved methods, your courteous treatment, your wonderful record of results amazes me. I know that I can return home and raise better hogs, better horses, better cattle. Your organization and your factory should be an inspiration to every stockman."

ECONOMY STOCK POWDERS are a medicine—not a stock food—not medicated salts, but a purely medicinal compound composed of the very best and choicest of Herbs, Roots and Sodas—not a cure-all but a genuine conditioner made of ten different ingredients—every one of high medicinal value and scientifically compounded. As a Conditioner Economy Stock Powders stand alone. They have no equal; there are no substitutes. They are so proportioned as to act directly upon the liver, kidneys and stomach, and assist in the assimilation of the food. You can always depend upon Economy Stock Powders to build up torn down tissues and run down constitution.

Economy Stock Powder Made For a Purpose

For Hogs

Economy Stock Powder Made For a Purpose

Economy Stock Powder keeps the hog in a good thriving condition by acting on the liver, kidneys and blood. Keeps the stomach sweet. Acts as a general cleanser of the system—expels all worms—aids digestion—purifies the blood—keeps the bowels loose and active—prevents disease. Your brood sows need it to bring forth and properly nourish a sturdy healthy litter. Your pigs need it to ward off worms, keep stomach, bowels, kidneys and liver in order—to make them grow rapidly, finish quicker and at a substantial saving in feed cost.

Economy Stock Powder Made For a Purpose

For Cattle

Economy Stock Powder Made For a Purpose

Economy Stock Powders fed to cattle will pay for themselves several times over, not only in saving of feed, but by causing good digestion, and will shorten the feeding period from 15 to 30 days, also give a soft velvet finish, which will attract a high price on the market. When the Powder is fed regularly to the cattle it will prevent founder, indigestion and impaction. The different sodas in the powder not only expel the gases but also produce more of the digestive fluid for the stomach and cause every digestive organ to perform its proper function so that from 10 to 15 per cent more of the nutritious qualities is extracted from the food.

Economy Stock Powder Made For a Purpose

For Sheep

Economy Stock Powder Made For a Purpose

Economy Stock Powders are especially adapted to sheep. They are a tonic, a laxative, a blood purifier and a positive worm expeller and as an aid to digestion cannot be improved upon. When the powder is fed regularly it not only keeps the worms expelled and the constitution built up, but will insure a healthy and thrifty lamb and improve the wool both in quantity and quality. Let Economy Stock Powder help you by keeping the constitution built up, the blood purified and by preventing constipation and indigestion.

Economy Stock Powder Made For a Purpose

For Horses

Economy Stock Powder Made For a Purpose

Economy Stock Powders are indispensable for work horses, mares and stallions. It is a genuine renovator, laxative, blood purifier, positive in action, sure in results. Economy Stock Powders are valuable in all cases of worms, loss of appetite, stoppage of water and bowels, coughs and colds, epizootic, distemper, colic, and will cure all cases of general debility where a blood renovator and tonic is necessary.

The Result of a Forest Fire

Feed Her and She'll Feed You

Silos have been a necessity ever since farming and dairying have been regarded as profitable businesses. Yet it has taken years for the farmer to recognize this. During the last few years he has come to know that it is an indispensable asset.

Today he wouldn't be without it. It increases his dairy production, lessens his feed bill and preserves the full food value of his crops. The Simplex Silo has done more toward causing this awakening than any other make. It is more practical and efficient. It is the last word in up-to-date feeding methods and a life-time land mark.

The Simplex Silo

is built of Oregon Pine Clear 2x6 Tongue and Groove Staves running full length the heigh of the silo. No end joints to leak and cause spoiled silage. With the CRISELL TANGENT TOP which keeps the silo in a true circle, in conjunction with diagonal cable bracing to the foundation, the SIMPLEX stands in its original shape under all conditions. Doors are heavy, air-tight, two-way type—hinge or lift.

SANTA FE LUMBER COMPANY,
18 California St., San Francisco, Cal.

Please send me folder describing Simplex Silos, also information about Papec Ensilage Cutters.

The *Simplex Silo* is guaranteed. Money back if it doesn't meet our claims. Write for additional literature and blue prints. Increase your dairy profits by erecting a *Simplex*. Write today.

Own a Papec Cutter

The "PAPEC CUTTER" is built in the largest exclusive cutter factory in the world. It is the lightest running, cleanest cutting machine made. It operates with the smallest power and has the largest capacity.

"PAPEC" construction is simple, compact and rigid. Cutter knives and blower fans are attached to same wheel which revolves at low speed—600 to 700 revolutions per minute. It "throws and blows" evenly cut silage to the top of the highest silo.

The PAPEC is guaranteed. Write for circulars.

Seen This Week at the State Fair

By M. C. Holman Manager, San Francisco Office

WITH the opening of the gates at the big state fair grounds at Sacramento on Saturday of last week there was ushered in the greatest state fair that has ever been fashioned by California ingenuity. For the past several months the various committees have been laboring diligently to bring forth an attraction that should at once visualize the acme of agricultural, horticultural and live stock production in the state and furnish amusement for the thousands of people who will grasp the opportunity of seeing California's big state show.

The spacious grounds are located about five miles from the heart of the city of Sacramento. They are reached by two lines of trolley cars, several bus lines and the interurban electric line. The trip takes one past the great capitol buiding and through a very beautiful home section.

Passing through the main gate one is awed and dazzled by the splendor and magnificence of the scene. Flags are flying, bunting is waving, boys are calling the daily program of events, and the spirit of active interest prevails. Directly in front of the gates is the imposing, new horticultural and agricultural building which had its initial baptism of fruits, flowers and vegetables at this season's show. The massive brick and stone structure is about 300 feet long by 150 wide and houses most of the county exhibits, this year 20 in number, which in themselves make a splendid and attractive exhibit.

To the left after entering the grounds is the big automobile tent wbere dozens of models are shown, some with chassis only, others stripped for racing, while others are completely equipped in the most luxurious and pleasing fashion. On the right is the truck tent where trucks of various styles and sizes are found. These two tents are always interesting to the modern farmer, for he enjoys the pleasure of his auto and the benefits of his truck.

Turning to the left at the first road one comes to the entrance of the machinery building wherein may be seen the working of farm machinery of all kinds, together with powerful pumps throwing great and small streams in all directions. The noise is deafening, yet it is the noise of the implements of peace, not those of war; it is the voice of achievement, of construction, of advancement, of progress; not the voice of destruction.

Following this road we arrive at the poultry building. An excellent display of poultry, geese, pigeons, turkeys and rabbits will be found here. The very cream of the barnyard is displayed and the competition is most keen, for the coveted prizes mean much in increased value for the winners.

Like everything else of its kind the state fair has its main feature, the big section. That is the live stock section where sheep, hogs and cattle are penned. Great crowds are accustomed to haunt this section.

Passing from the live stock section we notice the childrens' playground where the little ones find complete pleasure on swings, coasters, sand piles, poles and other forms of juvenile diversions.

The women's restroom faces the playground and is fitted with all modern conveniences. Easy chairs may be had for the tired mothers, and correspondence paper will be found for the bewitching young lady who has promised all her friends that she will write home.

An immense drill ground lies in front of the horticultural building, and here on occasion soldiers and sailors give exhibitions of their superb training. Military bands frequently entertain the crowds, and athletic events usually find a place on the day's program. It is an open court for the home picnic which is always in evidence.

Now, retracing our steps and turning to the right from the main entrance road we come to the manufacturers' building. This is devoted to a display of all kinds of labor saving devices, furniture, stoves, pianos, cleaners, electrical appliances of every description, sewing machines and an almost nameless variety of other products from the factory and the school.

We jump at once from the manufacturers building to the big dairy section where will be found the best and highest bred dairy cows in the country, all elegantly groomed, with their production and their food being measured to a very exact scale.

A model dairy barn is shown with all of its equipment, together with a refrigerating plant, milking paraphernalia of all kinds, silos, feed cutters, engines, churns, milking machines of different types, and dozens of labor saving contrivances for the dairy.

Adjoining the dairy barns are the horse barns which are filled with the pick of equestrian beauty. Great Belgians, Clydesdales, Percherons and Shires lead in weight; French coach horses, with their magnificent spirit, the pacers and the trotters have their coterie of enthusiastic admirers.

One of the most interesting and instructive exhibits is that of tractors. This year's display is housed in two mammoth tents, 150 feet long and 60 feet wide. The tractors are always shown in a very complete exhibit. Manufacturers are desirous of presenting the merits of their respective machines, and the attendants are willing and able to point out the advantages possessed by their tractors over all others. One can gain a fair knowledge of the construction and operation of tractors by a careful study of the various types exhibited and listening to the discourses upon the several features. Lectures are also provided by the California Tractor and Implement Association, and they include talks upon the care and handling of tractors, lubrication, mechanical construction, repairing and the use and abuse of tractors.

One of the two tents is filled with accessories, and it usually includes a complete workshop where the visitor may see how repairs on tractors are made, watch the process of grinding the valves and gain much money-saving information all free of cost.

Those who delight in horse racing receive a good income on their 50 cent investment, as there is racing for about two hours every afternoon on the big mile course. Trotting and pacing races win the enthusiasm of crowds numbering close to 30,000 people on the big days.

There are plenty of restaurants, lots of side shows and dozens of ways to amuse one's self. There is never an idle moment at the big show.

Of special commercial features it will be interesting to note that of the California Hydraulic Engineering and Supply Company of San Francisco. This exhibit consists of a complete demonstrating display of milking machines, together with barn equipment, stalls, stanchions, feed and litter carriers and hay tools. The company also has one of the Alamo Silent Farm Lighting Plants in operation.

The De Laval Dairy Supply Company shows its complete line of cream separators, gas engines, feed cutters and dairy accessories, including milk testers, barn equipment, pumps, etc. Its space is 80 feet long by 20 wide and is conspicuously located in the dairy section.

The Delco Light Company has a full working model of its famous lighting plant for the farm house and grounds. This has been an attractive feature of the manufacturers section for a number of years.

The Killefer Manufacturing Company displays its tremendous sub-soil plows which penetrate the under surface, stirring up the ground to a depth of three to four feet.

And there are hundreds of other interesting commercial exhibits that are most wonderfully attractive. The whole fair is a fairyland of activity, a place of supreme interest that is well worth the time and money spent to see it.

The 1919 California State Fair

By R. P. Royce

THE expression "the biggest ever" as applied to fairs is so threadworn that its use is to be discouraged. However there are times when "biggest ever" seems to be the most useful phrase at hand for establishing comparative proportions, but rather than run the risk of using such a shop-worn term, the writer will venture the statement that the 1919 California state fair has registered improvement in every direction. That such is a fact is not to wonder. All branches of agriculture and live stock are developing in this state at an unusual rate, and inasmuch as the state fair is planned as the one big representative exhibit by which the progress of the state agriculturally and industrially can be measured, it is to be expected that the annual fair at Sacramento should show progress each succeeding year.

The California State Fair opened on schedule time—thanks to the California spirit. With a serious demoralization of traffic, brought about by the striking trainmen of Los Angeles, facing the officers and directors, with exhibits stopped en route and others not loaded at their origin, the mangement with rare courage sent out the word—"Will have a fair—strike or no strike, and will open on time." Plans were made to meet any contingency; judging was delayed a day or two to accommodate late arrivals; trucks and trailers were pressed into service and when the gates opened practically all original entries were in place.

While the California state fair in point of age can be counted one of the oldest fairs in the United States, in point of real development and accomplishment it is young. The first state fair was held at San Francisco in 1854, the second at Sacramento in 1855, in 1856 at San Jose, the following year at Stockton, and the next year at Marysville. Following the Marysville exhibit the fair was taken to Sacramento, where it has been held each year, except in 1915, the year of the Panama-Pacific International Exposition. Notwithstanding the fact that the fair was permanently located at Sacramento, it led a rather uncertain existence until 1907 when steps were taken to give it a permanent home. Prior to 1907 leased locations were used which precluded the erection of permanent buildings and substantial growth. So the real development of the show dates from 1907 despite a life of 65 years.

The progress made since 1907 has been marked and in keeping with the development of the state. Each year the directors of the state board of agriculture have given their best thought in an effort to make the fair as representative as possible, and each year it has taken on more of a finished appearance.

The one outstanding improvement to be noted this year is the completed county exhibit building erected at a cost of over $300,000. This building on the site of the building burned in 1916, will form the center for future development of the grounds, and subsequent building will conform to the same architecture. It is a building that any state would be proud of.

The slogan adopted for the 1919 fair, "A Show Worth Millions for a State

Continued on Page 299

Agricultural News Notes of the Pacific Coast

Northern California

Arbuckle will hold an almond festival.

Petaluma celebrated Egg Day on August 30.

Alameda County is planning a poison drive on squirrels this month.

California's rice crop it is estimated will total 4,500,000 sacks this year.

Rapid growth of Johnson grass is threatening rice fields in Butte and Glenn Counties.

It is stated that Japanese own one-third of the rice producing acreage in Butte County this year.

The University of California opened with an enrollment of 8294. This is more than double the enrollment of last year.

Sonoma County farm bureau will put two new cow testers to work in September in the Bodega and Petaluma-Valley Ford districts.

Twenty carloads of beans are now being shipped from California daily and supplying 90 per cent of the beans consumed in the United States.

Five aviators from Mather Field, Sacramento, will fly to Oregon this month and will remain there for several weeks in the service of the aerial forest fire patrol.

Prune and raisin growers, because of the cool nights prevailing in many sections, are beginning to speculate on possibility of loss such as occurred last year owing to early rains.

President Stephens of the Pacific Rice Growers' Association says that the market for California rice is strengthened by the shortage in the rice crop of the Orient last year.

Citrus growers of Butte County are petitioning the state university to locate in that section a plant pathologist to make complete investigation of causes of citrus blast and ascertain, if possible, a remedy.

Sutter County fruit growers have agreed to pay $3.25 per ton for picking grapes, and 12½c per 50-pound box for picking prunes. No rate was fixed for fig picking, which is now paid at the rate of 30 cents a box.

Poultrymen of Alameda County recently made an auto excursion to the Santa Cruz poultry section to study the methods of work of poultrymen in that section and discuss their common problems.

Wild duck herding is the latest field open to aviators. H. O. Jacobson, manager of one of the big rice fields in the Sacramento Valley announces that he will use an airplane this fall to herd the birds off his place.

Edward Cebrian, cattle grower of West Sacramento, has just received at his ranch two of the highest priced beef bulls ever brought to the Pacific Coast. One was purchased at a live stock sale in Chicago and the other from a Canadian breeder, Cebrian paying $25,000 for the two animals.

A county license system for automobile trucks is proposed in an ordinance in Sacramento County now being drafted. It is based on the theory that auto trucks are responsible for the greatest wear on the highways and that a revenue from them is the fairest means of raising necessary maintenance funds. The license fee is to be a small one, and in proportion to the load capacity.

Central California

The new sorghum factory at Hughson is operating.

Joseph Galliano of Clovis is starting an experiment in silk worm raising.

Lodi, San Joaquin County, expects to get a carload of government foodstuffs.

Tulare stock men have been making heavy shipments of mules outside of the state.

Tulare County's live stock and agricultural show will be held at Tulare, October 8-11.

The prune crop of the Santa Clara Valley is coming in three weeks ahead of last year.

Lodi's first carload of Tokay grapes for the season was sent by express to New York.

Peach growers of the Kerman district are hauling their dried fruit to the packing house at Biola.

A large proportion of the table grape shipments from Fresno district are of the Malaga variety.

The Lodi Fruit Growers Association will ship 100 cars of fruit through the California Fruit Exchange.

An outbreak of sheep scab is reported in the section lying along the Madera-Fresno County line.

Ranchers in the Kerman district of Fresno County are now busy with a squirrel poisoning campaign.

County Veterinarian Covel of Madera reports several outbreaks of hog cholera, which he is handling.

Cantaloupe growers are advised not to plant cantaloupes next year on fields which were affected by disease this year.

Stanislaus County is discussing the purchase of permanent fair grounds, live stock sales yard, etc., in the city of Modesto.

The Madera County farm bureau has appointed a manager for its department handling purchase and sale of feeding stuffs.

Farm Adviser Sullivan of Tulare County has on hand for distribution some tested seeds grown on the University Farm at Davis.

The federal bureau of markets has ended its market reports on cantaloupes and watermelons and has closed its office at Turlock.

The California Peach Growers' Association is arranging special means of handling the large amount of small sized clings that are showing up.

Manager Coykendall of the California Prune and Apricot Growers says the association will handle 180,000,000 pounds of prunes for members this year.

The Tulare Cooperative Poultry Association reports falling off in egg production owing to hot weather; also a cut in prices owing to the release of eggs now in storage.

Sweet potato growers met at Turlock Tuesday, August 26, to discuss details of sweet potato standardization and packing. Growers of the Atwater section met on the Monday preceding.

Professor Eason of the state university has been making a survey of the poultry raising section in Stanislaus County with a view to making arrangement for lecturcs and demonstrations to be given this fall.

Southern California

The Elsinore cannery has opened on tomatoes.

The Yucaipa Valley apple crop breaks all records this year.

Construction has started on the big new packing house at Coachella.

Lankershim walnut growers report offers of 28 cents a pound for their nuts.

Escondido invites everybody to come to her grape festival September 9.

Cotton picking has begun in the Palo Verdc Valley of Riverside County.

Cotton pickers are busy in the Coachella Valley. They make two cents a pound.

Manager Linn of Riverside Citrus Exchange estimates crop at 50 per cent of normal.

Many of the small streams in the San Bernardino mountains have already dried up.

The growers' association of Hemet-San Jacinto has handled nearly 3,000 tons of apricots.

Hemet apricot canneries report some disappointment among cutters and packers both over the small size of fruit.

The California Prune and Apricot Growers, Inc. is planning for a membership drive throughout the state this fall.

A new cow testing association has been formed by dairymen who are members of the Orange County farm bureau.

The Santa Ana Valley Walnut Growers' Association expects to ship 1800 tons of nuts this year. Last year it handled 1300 tons.

President Lewis of the Santa Ana Valley Walnut Growers says the damage to nuts from the codling worm is less than last year.

The Murrietta farm center will show a duplicate of its big cooperative grain elevator at the Southern California Fair at Riverside.

The management of the Southern California Fair at Riverside is planning to hold a sale of pure bred cattle during the fair week.

One Antelope Valley cantaloupe grower lost two carloads of ripe "cants" which could not be moved because of railway strike.

The election in Oxnard drainage district resulted in an overwhelming vote to carry through the drainage plan, bonding the district for $200,000.

The new dehydrating plant at Pomona has begun operation on grapes. After the grape season is over it will handle vegetables. The plant is installed in an old winery building.

The Traction Engine and Implement Dealers Association of Southern California will hold field demonstrations on the Rancho La Brea west of Los Angeles, September 16-21.

The Arizona-California River regulation committee of the Los Angeles chamber of commerce has reported favorably to the construction of the All-American Canal in the Imperial Valley.

The canning plant of the California Canners at Santa Ana is now operating on chili peppers, handling 50 tons daily. Most of the chilis come from the Garden Grove and Stanton districts and are brought in by motor trucks.

The Coast and General

Wasco County, Oregon, will hold its fair October 7-11.

The mohair pool of the farm bureau of Linn County, Oregon, sold at 64 cents.

The mohair raisers of Linn County, Oregon, produced five car loads of fleeces.

The first convention of Northwestern seed growers, seed dealers, and state officials was held in Spokane, Washington, August 29-30.

The Oregon National Farm Loan Association, with headquarters in Salem, claims to be the largest federal farm loan association in the Northwest.

One thousand new silos are going up in Oregon this year according to the statement of W. L. Westover, silo specialist of the Oregon agricultural college.

The last of the eight car loads of black cherries shipped by the Apple Growers' Association of Hood River, Oregon, set a fruit price record, selling for $4678 net, f. o. b. Hood River.

County Agriculturalist Waub of Lane County, Oregon, says that the acreage in corn this year in that county is at least 8000, a 2000 acre increase over last year's plantings.

Milk producers of Clarke County, Washington, have organized the Dairy Products Company for the manufacture of butter, condensed milk, ice cream and cheese, and are offering $100 for a name for their product.

Showers fell in the northern and eastern portions of Arizona last week but did not interfere with farm work. The warm, clear weather has been of decided benefit to the Arizona-Egyptian cotton in the Salt River Valley, reports indicating a rapid recovery from the effects of too much rain.

A trainload of Yakima, Washington, lambs made up from consignments from several of the wool growers started for Chicago recently. John Cleman loaded four cars at Ellensburg, J. B. Kays loaded five cars at Yakima and five at Toppenish. Cort Meyer loaded two at Mabton. Many trainloads will be sent East during the next three weeks.

The new Western Washington dairy farm at Puyallup will not be finished as planned when the funds were appropriated by the last session of the legislature, because of higher costs than had been anticipated. The modified plans call for an experimental dairy farm with a capacity of 50 milking cows and a total of about 100 head, including young stock and bulls.

The Pierce County, Washington, Milk Producers' Association voted almost unanimously at its annual meeting to test the new state anti-price-fixing law on dairy products, which was branded "a fool piece of legislation." No new milk price was set at the meeting, but increasing cost of feed, it is said, will compel the dairymen to ask more for their product.

Five threshing machine explosions in one day, all caused by smut, were reported from Walla Walla County, Washington, by Captain W. A. Groce, assistant state firo marshal. Captain Groce said that had the machines been equipped with the suction fans recommended by the federal department of agriculture for drawing smut out of the cylinders the explosions probably would not have occurred.

The Fire Menace in California Forests

By Arthur L. Dahl

THE present summer has been a particularly bad one from the standpoint of the number and destructiveness of the forest fires that annually visit our timbered regions of the West and North. In spite of the greatest efforts made by Uncle Sam and his hundreds of trained forest rangers, these destructive fires break out and not only devastate vast areas of commercial timber, but lay waste prosperous communities, burning grain, orchards, homes and valuable improvements that lie in their path.

Practically all forest fires are started as a result of carelessness, for while lightning will occasionally strike a tree during a thunder storm and start a fire, in 99 cases out of 100 the fire starts from a lighted match tossed carelessly aside amongst dry leaves, or sparks carried from an abandoned camp fire, or some similar thoughtless act of man. In its campaign against the fire hazard the forest service lays the greatest stress upon educating the public to prevent forest fires by being careful of their every act while surrounded by inflammable material.

There are a few people who believe that forest fires are not always the enemies of mankind that we are taught to believe, basing their belief on the theory that if the dense undergrowth that springs up in the open spaces is removed occasionally by fire, the mature trees and the grass for grazing have better chances to develop. They cite the practice of some Indian tribes in burning certain parts of their hunting grounds as proof that the Indians wanted to improve their grazing.

This theory, however, is neither scientific nor true as observation of the effects of fire will easily demonstrate. Aside from the redwoods, which seem immune to fire, practically all forest trees are injured by burning, and even a light fire will absolutely kill the young growth and prevent reproduction. While it is true that after a fire has visited a certain area, green vegetation again springs up after the rains, this vegetation is nearly always inferior to that which preceded it, and in the course of several fires the grasses and forage suitable for grazing entirely disappear, leaving only scrubby chapparal to occupy the ground. Furthermore, where the forest fire occurs in a locality where the vegetation is dense and the flames become very hot and burn for some time, all of the vegetable matter in the soil is destroyed and a chemical change takes place in the ground that often prevents any kind of vegetation from again getting a start there. With the top unprotected from the hot sun and heavy rains, the ground is soon washed away to bedrock, and where steep grades occur, as on our mountains, the earth and rocks are washed down by the flooded waters, filling up the streams and spreading out over the finer soil of the valleys, bringing destruction in their wake. All of these evils follow forest fires.

Perhaps the day will come when the people who use our forests or travel through our public lands, where the danger from forest fires exists, will be educated to the point where they will no longer be careless and start them, but until that time comes the forest rangers find it necessary not only to warn people against the hazard, but to take steps to overcome fires when they occur.

In the majority of our national forests, particularly in California, the chief duty of the forest rangers is to prevent and extinguish forest fires, and the scheme of their work is laid out on that basis. Each ranger is assigned a definite district in which he lives and which he patrols during the fire season. He becomes familiar with all the topographic features of the area under his charge, learns the sources of danger and plans in advance where to go for help when the need arises. By being constantly in the saddle during the dry season he rides from ridge to ridge or visits the places where the danger from fires exists. He knows the various settlers in his district and arranges with them to report any fires that might occur in their vicinity, and if campers or recreationists come into the district he cautions them against building camp fires in dangerous places. To enable him to keep in close touch with the forest supervisor and the other rangers the government has installed telephone lines leading from the ranger stations to headquarters, and a portable instrument capable of being attached to the wires at any point is a part of each ranger's equipment. As time is the vital element in fighting fires it is of the utmost importance that speedy and adequate assistance be secured as quickly as possible. Supplementing the telephone lines of communication the forest service now maintains a number of central lookout stations constructed on the tops of high peaks overlooking a wide expanse of territory. In these lookout stations a ranger is stationed whose sole duty is to watch for fires. Usually the lookout station is round in shape, with windows on all sides, so that the watcher has a clear view in every direction. He is furnished with powerful field glasses and with various scientific instruments for locating particular spots on the map, estimating distances, etc. Should a cloud of smoke be discerned in the distance, by using his instruments he can locate the place approximately on the map, and by telephoning the information to the nearest ranger or to the supervisor's office, a force of fire fighters can be immediately dispatched to the scene.

Nearly all the rangers are taught the elements of surveying, the use of a compass, etc., and during the periods when the fire hazard is not great the men are used to make detailed maps of their districts. On these maps are shown the location of all roads, streams, settlements, and other information of value. Contour lines are drawn and elevations determined. These maps, under the direction of skilled engineers and draughtsmen, are enlarged and drawn to accurate scale. Copies are furnished to the rangers so that they can be familiar not only with their own particular district, but those in other parts of the national forest as well. On these maps are also located the permanent tool chests and supply station from which they can secure the necesary fire fighting tools when needed.

A hundred men unequipped with proper tools would be about as useless in fighting fires as a hundred soldiers without arms would be on the battle field. In the old days when men were sent from the valley towns into the mountain fastnesses to fight fires, it was found on arrival that there were only a few mattocks or rakes or shovels available, and the men had to take turns in using them, just as the Russians had to wait for a man to be killed before securing his gun. Now, however, the government has installed hundreds of permanent tool chests in various parts of the national forests, in which are stored for fire use supplies of shovels, rakes, mattocks, water canteens and other essentials to fire fighting. When a fire occurs in a particular district the ranger goes to the nearest tool chest and obtains the tools needed to equip the men, thus saving valuable time. While these tool boxes are kept locked, each ranger has a key, and often the nearest settler is given a key for use when a ranger is not near.

To render all parts of the mountains acessible and enable fire fighters to be brought quickly to any given spot, the government has constructed thousands of miles of trails and roads, built on good grades and kept in good repair. In Southern California, where the fire menace is acute on account of the dry chaparral covering of the mountains, a wonderful system of trails has been constructed, leading up all canyons and rendering accessible all parts of the mountains. Toward the construction of these trails the county supervisors, water companies and other interested parties have contributed large sums of money to supplement the appropriations made by Uncle Sam. This is also true of firebreaks or fire lanes built along ridges or at the base of the mountains to aid in fighting any fires that occur there.

These firebreaks are merely long strips of land which are entirely cleared of vegetation and kept clear of all inflammable material. They vary in width from 50 to 100 feet or more and are designed to prevent the spread of fires. They also serve as effective points from which to start backfires. The system of fire lanes is based upon the experience of the Indian forest service, for in India the forests are all divided into districts by elaborate systems of firebreaks. Should a fire start in a certain locality it can be prevented from spreading by these cleared spaces. Where firebreaks are constructed, if a fire starts, the rangers usually concentrate their force along the cleared lanes and by starting backfires broaden the area of barren land so that the fire must die out from lack of further material. As a means of restricting fires and enabling the rangers to quickly control any that start, firebreaks are well worth their cost, and the system is being gradually extended in Southern California as fast as funds will permit.

To get men to the scene of a fire quickly the forest service maintains a number of automobiles, especially equipped with fire fighting tools, which are used where roads lead to the scene of the blaze. In the higher mountains the men are taken in on horses, or they walk, the supplies being packed in on horses or burros, a number of which are kept by the service for the purpose. To compel able-bodied men to fight fires if they refuse to respond to requests for assistance, the federal and state laws empower rangers to draft men into service. To compensate the fighters for their time the forest service usually sets aside a certain appropriation to be used in paying the men. Arrangements are also made with irrigation and power companies employing a number of men on construction work, to dispatch their crews to help fight fires when they threaten the watershed in which they are interested. Most of the fire fighters, however, are picked up in the valley towns and taken to the scene of the fire by the rangers.

Save the Water

A writer in the Agricultural Review, organ of the International Dry Farming Congress, is appealing for saving soil moisture. He says:

"Few realize the amount of water taken from the soil by a growth of even small weeds. Each weed takes as much as a cultivated plant of the same size, and since there are many times more weeds in a given area than of cultivated plants, moisture is sapped in proportion.

"Experts differ as to how moisture escapes from the soil, when there are no weeds or other vegetation. Some claim the water rises to the surface by capillarity, while others say the water first evaporates within the soil and then moves upward through the interstices between the soil particles to the surface, and out into the atmosphere. The writer of these lines holds to the belief that the latter theory is more nearly correct, but it really makes very little difference in practice. If a proper soil mulch is maintained, the escape of the moisture is greatly retarded, whether it reaches the mulch in the form of vapor or water. In making the mulch the innumerable soil cracks which act as so many chimneys for water vapor to escape through are broken up. If water deep below the surface evaporates and rises, it is checked when prevented by any means from passing out into the atmosphere and becomes soil moisture again. This is proven by covering a space of ground with boards or any other impervious material, when the supply of moisture in the soil is too small to enable capillary attraction to overcome the pull of gravity. This also explains why ground that is too dry to plow can frequently be made plowable by disking. The mulch made by the disk checks the upward flow of the water vapor coming from below, and as it continues to rise and collect under the mulch it becomes more and more dense, until finally the dry soil particles reabsorb it.

"The conservation of soil moisture is the basic principle of dry farming."

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

To any Californian the photograph on this week's cover brings a reminiscent shudder as he recalls the days when the smoke clouds hung over the nearby mountains and nights when the terrifying glow from the forest fires flaunted itself as a banner of destruction. Too well he knew what the fire meant to his irrigation supply next summer when his orchards would be crying out for the water which the fire denuded mountain slopes had let rush off to the ocean to be wasted. Every year has seen improvement in fire fighting and precautions to prevent fire. This year excellent work has been done by air patrols in both Northern and Southern California national forests. On fifth page of this issue Mr. Dahl tells what Uncle Sam is doing to protect our watersheds.

WHY?

Discussing the matter of securing returns for the egg producer, the Petaluma Poultry Journal says:

"The egg speculator is hardly to be blamed for trying to keep poultrymen from signing up with the corporation, for the corporation reduces his gains; but when the speculator talks the poultryman should 'wink the other eye.' The corporation will live and continue to be successful, and eventually the man who now hangs back will become a member. Why not add the strength of your name and get the honor attached to membership right now instead of wasting time?"

And so long as the poultry producers who read the California Cultivator are reasonable people, the only comment we will make in addition is, Why?

NEXT YEAR'S FRUIT

Too often the deciduous fruit grower considers that the approach of the dormant season indicates that his trees have ceased drawing upon the soil for nourishment. The fruit is off; the leaves are dropping; hence why the need of continued expensive irrigation? The same man would not think of withholding feed from his cow which has ceased to give milk or his horse which, for the time being, is taking a rest, for he realizes a certain amount of maintenance ration is necessary. This is equally true of the tree. Even at its most completely dormant season the tree has certain demands for water, and particularly is this the case when the buds are forming this fall for next year's fruit crop. Continued or heavy irrigation at this period is not required and under certain conditions might prove detrimental, that is, a new growth might be given to the tree which, with the coming of November's cool nights, might injure it and cause a reduction in next year's crop. But this is hardly probable. The careful grower can soon learn the needs of his trees by inspection.

See that there is sufficient moisture to give lusty, strong fruit buds this fall for next spring's setting.

MORE WHEAT

The University of California, the Sperry people and others are conducting a magnificent campaign for more and better wheat in California. Our production today is only a mere fraction of what it was a score of years ago. This reduction has been caused partly by making orchards, vineyards, or possibly rice fields, of the former wheat fields. It is also due in part to the belief of the wheat producer that California lands were "worn out."

But tractor farming is turning up the farm under the farm and disclosing the fact that there are still thousands of acres of California's rich fields which will produce large crops of wheat. In addition to turning up the "new farm" by deeper plowing there has been a searching for and creating of new varieties which are found even in trying seasons to produce crops in excess of those of the "days of old, the days of gold."

Two varieties which it is now declared are succeeding best in California are the Early Baart, grown for some years, and a still newer variety, Bunyip. The foundation for this wheat now in the state was 100 pounds of wheat secured in 1915 from the Australian exhibit at the Panama-Pacific exposition. This hundred pounds increased until last year it became 100 tons. May the wheat production of California increase proportionately.

KEEP CREDIT GOOD

It has been asserted by financial oxperts that one reason why farmers' interest rates are higher than those given to mercantile people is because the farmer is, as a classs, lax in payments of interest. He knows he's perfectly good, but allows time to drift by, and his interest is paid on convenience rather than on time.

This way of doing things, if carried into the latest farm financing, that of the federal farm loan bank, will have the same depressing effect on values of the bonds that it has on other farm paper. A desire to prevent this has induced President Joyce of the federal land bank at Berkeley to issue a statement, really an appeal to farmers to keep up their regular payments. Mr. Joyce writes: "A few of our borrowers are delinquent more than 90 days in their installment payments. In most cases a sufficient reason has been given us for the delay; however, it is most important that all instaliment payments be made promptly when they are due. Any mortgage upon which a payment is delinquent 90 days must be withdrawn as a basis for bond issue. The board considers such mortgages undesirable. All securities so withdrawn must be carried by the bank. In order to keep ourselves in funds it is necessary that every mortgage which we have is available as a basis for bond issue. Therefore, the necessity for prompt payment of installments must be apparent to you. It might give rise to the thought in the minds of the members of the farm loan board at Washington that associations whose borrowers are in the habit of being delinquent in their payments are located in an unfavorable region. I am glad to say, however, that in the majority of the associations in the 11th District, there has never been an installment payment delinquent 90 days."

MOTOR TRUCKS

Farmers in some communities have found advantage in cooperative ownership of motor trucks of large capacity. At first this was merely a matter of self defense from excessive transportation charges, but has proved so economical and so effective in giving to the farmers of the community transportation when wanted that the movement will grow, and in all sections of the country these cooperative organizations will exist. It costs many hundreds of dollars to get a dependable truck of large capacity, and its use on one farm of ordinary size is so limited that the investment is not justified, but a dozen or a score of farmers may well unite, and this so reduces overhead expense that it is proving profitable. Operation expenses, depreciation, overhead, interest, etc., may be distributed equitably by very simple bookkeeping.

Comenting on one of these association in the Middle West, which has proven exceptionally successful, the department of agriculture says:

"According to the experience of the Harford County Cooperative Association the rural motor route supplies a solution of transportation and marketing problems for many farming sections which are located not more than 30 to 40 miles from a desirable city market and which are favored with permanent hard roads. Farmers who organize such associations are advised to study carefully their local conditions so as to be sure that there is enough year-round hauling to justify the establishment of a truck route. They should raise sufficient funds at the outset so that they can pay cash for a truck. It is cheaper to operate a four or five-ton truck that it is to run one of two-ton capacity, provided there is sufficient tonnage available. As a rule, the new club will not go wrong if it begins business with a larger truck than it really needs, as the surplus space will allow for the expansion and development of the business which is sure to follow in well selected territory.

"Trucks of only standard make should be used, as under such conditions repairs will be easy to get and the overhauling of the truck will not be outside the ability of the average mechanic. In purchasing the trucks special attention should be paid to the cost of operation and records of performance as well as to the price of the machine."

STOP THE STRIKES

No more causeless strike was ever pulled off than that which has disrupted and caused enormous loss to producing and industrial interests of Southern California. The walk-out of the steam railway men was in direct violation of the contract of their union and was met by the union headquarters located in the East issuing positive orders to return. The members of the union asserted that it was an individual strike out and that the union was not concerned in it. However, it is asserted that votes were taken in the various lodge rooms of the order. But the issue now is not so much to place the responsibility for the losses producers and manufacturers, and in fact, the general public has had forced upon them as to find some method of preventing this wastefulness in the future.

As the Cultivator asserted last week the time is coming when a reasonable solution of this problem will be reached. Those whose interests suffer the most and who are most helpless in the entire matter are neither producers, manufacturers nor laborers, but the public which pays the bills. Every such strike which causes the loss of thousands of tons of perishables reduces the amount of food available and causes rise in prices, and from the very necessities of the case the losses forced upon the manufacturers and the railroad people have to be made up by increased prices charged the consumer. This, on top of the demands made by the laboring people, means only another addition to the H. C. of L., and soon it will become necessary for another increase in the wages, etc., forever.

In the matter of preventing loss in transportation it has been suggested that it should be provided, as authorized by the decision of the supreme court of the United States in sustaining the Adamson Eight Hour law, that whenever a labor dispute threatens the operation of an instrumentality of interstate communication, the president shall appoint a commission which shall write a contract for the parties, to remain in force until they shall voluntarily agree between themselves, thus retaining to both parties their freedom of contract, subject only to the paramount interest of the public in the continued operation of the railway service. Such proposals merely bring emphaticaly to the attention of the public and possible disputants the limits which the paramount right of social self-defense has long since placed upon the activity of combinations.

This suggestion is only one of many, and until the general public demands in most emphatic terms that this loss shall be stopped, we will probably continue the everlasting condition and continued losses.

Farmers of the Ceres district in Stanislaus County are seriously considering drainage problems.

THE STATE FAIR

Continued from Page 295

Worth Billions," perhaps best indicates the scope of this fair. Almost every branch of industry of any importance comes in for representation. Of course live stock, agriculture and horticulture hold the center, with mining and manufacturing following closely in importance.

This year's show of live stock is in no way disappointing, and in many ways is a surprise to those who are in close touch with the industry. There is no better criterion by which to judge the progress of animal husbandry than the exhibits made by breeders. The growth of the business is reflected in the growth of the exhibits. The show of swine is outstanding in point of numbers exhibited. The growth of this branch of the live stock industry during the past few years, especially during the past five years, has been phenomenal. All breeds are seen in the pens, and competition for breed honors is keen. Judging began Monday morning, September 1. The following judges have been engaged to pass on the different breeds: Wyman M. Lovejoy of Illinois, Berkshires; Thos. A. Shattuck of Nebraska, Poland-Chinas; Dwight Putnam of Nebraska, Duroc-Jerseys; Professor J. I. Thompson, University of California, Chester Whites, Yorkshires and other breeds. Aside from liberal prizes offered by the fair management, the various record associations are offering many special prizes and trophies. Futurity shows are staged by Poland-China and Duroc-Jersey breeders. A feature that is being given added importance is the show of fat barrows in breed and inter-breed competition.

The dairy cattle division is particularly well balanced this year, the major breeds being out in force with a quality of entries that promises much. In point of numbers the Holsteins have the largest exhibit, with the Guernsey and Jersey breeds nearly equal and not far behind. The entry list of Ayrshires is strong. Hugh G. Van Pelt of Iowa, a dairy judge of national reputation, is aligning the various classes.

The show of beef cattle, while not large, brought out a number of new herds to measure their strength with many of the older established herds that have been factors at former fairs. Two breeds, Shorthorns and Herefords, are represented. Professor John C. Burns of Texas tied the ribbons in both breeds.

One of the surprises of the entire live stock division is the marked increase and interest in the horse department, both light and heavy breeds. So large has been the increase that stall room is almost at a premium and several of the barns have had to be remodeled in order to take care of exhibitors. Again, in this department there is a pleasing number of new exhibitors. Professor Burns is scheduled to rate the heavy breeds and Professor E. A. Trowbridge of Missouri, a judge of national standing, passes on the light horses in the breeding classes and the night horse show.

The sheep show is somewhat above the average, but not up to what it should be. The principal breeds came before Professor R. F. Miller, formerly of the University of California, but now of Texas, for judgment.

Every foot of space in the new county exhibit building is taken, showing a splendid exhibit of the varied resources of the counties of the state. Elaborate displays are being made, all vying with each other to present the most complete and attractive exposition of resources. The following counties have exhibits: Yolo, Kern, San Joaquin, Fresno, Glenn, Sacramento, Solano, Los Angeles, Tehama, Placer, Kings, Alameda, Siskiyou, San Louis Obispo, Humbolt and Calaveras. Various branches of the state government have exhibits illustrating their work, one of the most elaborate and educational exhibits being made by the state fish and game commission. For a birdseye view of California a visit to the county exhibit building is most impressive.

The University of California holds a large part in this year's fair. So important has the university exhibit become that a special building has been set aside to house it. Every department is represented, but the work of the college of agriculture is stressed.

The show of tractors, automobiles, farm implements, silos, etc., is complete, over 66,000 square feet of space having been taken by the tractor and implement dealers.

The management of the state fair recognizes that the chief function of the institution is to serve an educational purpose and to hold out to all an inspiration for better farming, better live stock and better citizenship. However, it is not unmindful that the fair is expected to amuse and entertain the thousands who each year come to Sacramento for recreation. Accordingly all the usual amusement features have been taken care of and arrangements made to crowd into each hour of the nine days entertainment of high order.

The California state fair belongs to every man, woman and child in this state. It is first an educational institution and holds out encouragement to all to make progress. As such it deserves and enjoys the support of the entire population, and this year's event marks a new milestone in the development of California resources.

OREGON GROWERS ASSOCIATION

The new Oregon Growers Association has already lined up 15,000 acres of fruit in the Willamette and Umpqua Valleys and has hardly started its membership campaign. It will start with the crop of 1920. Robert C. Paulus, manager of the Salem Fruit Union, will be general manager and J. O. Holt, manager of the Eugene Growers Association, will be manager of the packing corporation, which will pack all fruits of the association. Many of the local growers' associations have voted to disband after the present crops are attended to and to become members in the new organization.

Prof. C. I. Lewis, for 14 years chief of the department of horticulture at the Oregon agricultural college, has resigned his position to become organization manager.

APPLE CIDER

Prohibition has created a great demand for non-intoxicating beverages, and nowhere is this demand more in evidence than in the case of our fruit juices. The fact should not be overlooked by those who have apples going to waste. There is a good chance to turn such fruit into a profitable source of revenue by making it up into cider.

It is predicted that with the increased demand, apple cider this fall and winter will sell for anywhere from 30 cents to one dollar per gallon. Much cull fruit which might not otherwise be profitably disposed of may be used in this way.

Care in washing the fruit used and in discarding the decayed and wormy apples will help in building up a trade.

Hard cider is, of course, tabooed, and as sweet cider is a more or less perishable product, suggestion in regard to keeping it sweet may not be amiss. Either of the following methods described in the American Fruit Grower is effective:

"Cider can be kept indefinitely with flavor and appearance unchanged at exactly the point desired and allowable, and you don't have to use poisonous preservatives either. Just filter it and then pasteurize it in the final container (bottle or jug) sealed tight at about 150 degrees Fahrenheit and hold it at that temperature for half an hour and you can't tell it from fresh new juice.

"Perhaps the most simple method known is to screen the cider through a cloth to remove the larger particles of solids, put in a copper kettle, evaporating pan, or steam evaporator, and heat until it will just come to a boiling heat. Meantime keep skimming off the scum as fast as it rises. The moment the juice comes to a boil, shut off the heat and pour into sterilized gallon jugs or other containers in which it can be corked up tight. The corks should be pressed a little below the level of the top and covered over with sealing wax. Then store on the floor of a cool cellar and the juice will keep for many months."—R. A. McGinty, Colorado Agricultural College

Order tulips, daffodils, and hyacinths for spring flowering. They may be planted the last of September or first of October with good results.

PROFITS FROM BY-PRODUCTS

The by-product, at one time considered a negligible quantity, is rapidly changing its significance, and has in several industries actually supplanted the product itself by taking first place as a financial success. The fruit business has taken such a development. On this point the American Fruit Grower comments:

The supply of fresh fruit is altogether too small to satisfy the fruit hunger of the purchasing public. It was long a question with growers of many fruits what could be done with the less perfect, the undersized and the windfall. Moreover, fruit will not keep fresh indefinitely, and even with such varieties as are suited to cold storage the expense is a heavy item during the months of storage.

When people cannot get fresh fruit they yet demand some fruit product, and the man who puts a good one on the market is sure of a satisfying return. Fruit juices of all kinds, jellies, jams, pastes, preserved fruit, and canned and dried fruit, all command good prices which will rise with the rising prices for fresh fruit.

Methods of producing by-products are constantly improving, and there is no reason to fear overproduction. There is a substantial underproduction at present and, should the time come when this is no longer so, the multiplicity of by-products offers a splendid outlet for the surplus.

It is unnecessary, however, to await an unlikely overproduction of fresh fruit before going into the business of by-products. It will be well worth your while to study the possibilies in this line of such fruits as you raise. Beginning in a small way, until you have found your market and know what its demands are, you may develop a line of sales that will surprise you by being really more profitable than the sale of your fresh fruit now is.

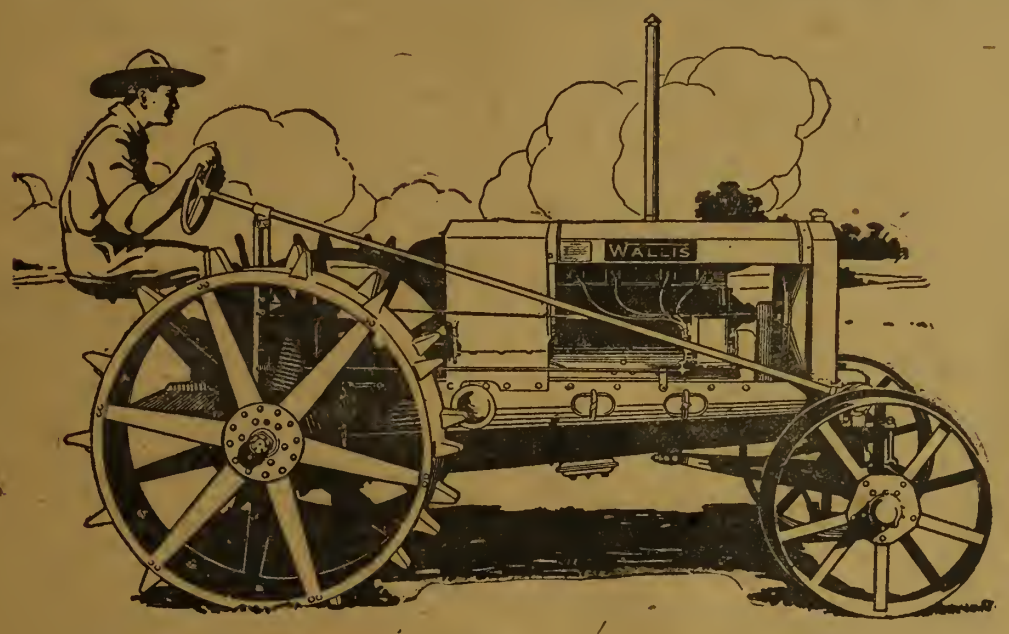
"HONEYDEW" GRAPES

A special conference was called by Director Hecke recently for the purpose of formulating regulations to govern the handling of "honeydew" grapes in packing houses to prevent the spread of mealybugs. It was definitely decided that under no conditions would grapes showing honeydew be permitted to be packed in crates for shipment. The mealybug under consideration has been in the state for many years and is common in greenhouses over the entire United States. It has shown a marked fondness for grapes ever since vineyards became extensive in California. While the insect does not destroy either the vine or grape, the sweet exudation which is deposited upon the fruit lessens the market value of the product. It is hoped to check this pest before it becomes generally scattered throughout the state. Some vineyards have been found so badly infested that growers will probably be unable to ship a car of grapes from these infested vineyards. Growers and packers are requested to avoid as far as possible bringing "honeydew" grapes into the packing house. They are not only hard to sort and cull, but there is great danger of spreading the mealybug to uninfested vineyards. Regulations regarding the handling of such "honeydew" grapes will be forthcoming in the near future.

WALLIS TRACTOR COMPANY RACINE, WIS., U.S.A.

WALLIS

America's Foremost Tractor



The Wallis is Your Logical Tractor Investment

STRICTLY on the score of its outstanding mechanical supremacy, you should select the Wallis. Developed by twelve years of successful service on thousands of farms, America's Foremost Tractor has earned a performance record beyond compare.

This compact unit of power has proven its ability to do more work for a greater number of years. Over a period of years, the Wallis shows most acres plowed per dollar invested.

It is simple of design and substantially built. It is lasting and durable. It is light weight and easily handled. It possesses proven features of construction that make it the greatest of all tractors.

These Wallis Superiorities Mean More Profits to You

The sturdy four-cylinder, valve-in-head motor delivers constant power from gasoline, kerosene or distillate. Pound-for-pound it is the most powerful tractor made; a full 74% of its power being usable at the draw-bar. There is ample power for the usual work, with a generous reserve.

The rigid, patented, "U"-frame of armor-plate steel is exclusively Wallis, and does away with unnecessary dead weight, and with the difficulties, expense and troubles of the ordinary frame.

The enclosed gears running in a bath of oil—first used by Wallis—have proven so efficient as to be a model for other tractor makers.

Moreover, a well-known institution, fifty years old, sells the Wallis, America's Foremost Tractor.

We Join Your Local Banker In Urging this Immediate Investment

Your banker will favor your investment in the Wallis, for he knows it will pay you handsome profits. Ask him.

The demand for the Wallis is tremendous. We urge you to see your nearest dealer immediately so as to have your Wallis for fall work.

Meantime, send for a complimentary copy of an interesting catalog showing the many economies in time, labor and money that proper tractor equipment can bring to you.

California Soils for Wheat and Barley

By Norman F. D'Evelyn

THE only soils in California that are not suitable for wheat are the peat and muck formations on the deltas of the San Joaquin and Sacramento. With all other soils it is mostly a matter of preparation of soil, of seed selection, of moisture, drainage, and time of planting.

In 1918 88 acres of very thin red gravelly clay near Chico produced 514 sacks of Baart wheat. In the same year 60 acres of sedimentary adobe near Stockton produced 1320 sacks of wheat, and many thousand acres of black loam land in the Tulare Lake region produced as high as 25 sacks of Sonora wheat per acre. The Moreing Brothers on their Natomas properties in 1918 had a yield of nearly 1000 acres that produced 25 sacks of Early Baart per acre.

The 1919 harvest has shown some equally satisfactory results. Nearly every type of soil has produced its quota of wheat. Failures have been due to lack of rain, foul land, poor seed, late planting, hot winds, poor soil condition and drainage rather than to lack of fertility of the soil.

The old claim that California wheat lands have played out is a fallacy. This year many fields are yielding as much as they did 35 years ago. A large amount of California's original wheat land is now planted to orchards, vineyards, alfalfa and rice, but there are still available many thousands of acres of pasture land, sandy and clay loams, that will produce six to twelve sacks (13 to 26 bushels) of wheat per acre at a good profit to the grower.

A study of California soils shows many varying types with the loams predominating. We have loams, clay loams, sandy loams, fine sandy loams, gravelly loams, and heavy stony loams. We also have considerable adobe soil—including clay adobe and black adobe. The adobe soils, the loams, red clay loams, and some of the sandy loams are good yielders of wheat. The rolling lands from Merced to Chico along the Sierra Nevada are mostly clay loams of varying composition, and capable when not too stony or too steep, of being so farmed as to produce good wheat crops.

The clay adobe of the Montezuma hills, the black adobe lands around Stockton, above Sacramento, and in the Salinas Valley will produce and have produced large yields of wheat. The alluvial soils on the west side of the Sacramento River are well suited to wheat as are also the lands of the west side of the San Joaquin Valley.

Whether wheat is the most profitable crop to raise on these various soils is quite another problem. There are many factors influencing the decision that every farmer must make regarding his crops. Many figure that if they can get 20 sacks of barley per acre they are doing better than if they produced 10 sacks of wheat.

Land that is foul with black oats will produce more barley than wheat, but land that is not well drained, or on which the water stands for many hours, or in localities which have late frosts, is not as suitable for barley as for wheat.

The introduction of early maturing wheats such as Early Baart and Bunyip has made it possible to produce 10 to 24 sacks of wheat on land that previously yielded eight to 10 sacks of Bluestem wheat. Lack of rain during April has always decreased the yields of Bluestem and Club wheats in California—while Early Baart and Bunyip are far enough advanced in their growth not to be so affected.

The wheat farmer must know better how to prepare his soil. He must choose the kind of seed most suited to his soil and climatic conditions. He must plant good seed at the proper time. He must see that his land is properly drained—and finally, he must eliminate weeds, black oats, smut and other foreign substances that cut down his yields and affect the value of his crops.

Dangerous Plants

"It is rather alarming to realize that a number of the wild flowers of which we are all so fond contain deadly poisons," says an article in "On Nature's Trail" in the Boy Scout magazine, Boys' Life.

"The daffodil is an instance in point. Its long, narrow leaves contain a powerful irritant poison, and children should be warned most strongly against chewing them.

"The common foxglove contains a poison which has the most extraordinary effect upon the heart, whose action may be reduced to only 17 beats to the minute. Of any one thus poisoned, the pupils of the eyes are widely dilated, and his only chance of life is to lie absolutely still until the doctor comes.

"Everyone knows the wild arum or cuckoo-plant, with its big heart-shaped, glossy leaves. A most dangerous plant it is, too. If you chew a leaf your tongue swells enormously; so much so that you will be almost unable to swallow. Melted butter is the best remedy for poisoning by this plant.

"The most dangerous of all common hedgegrow plants is the aconite or monk's hood, which has palm-shaped leaves. A very small dose causes a strange tingling all over the body, and partial blindness. A little more and death is certain.

"These are all plants which are more or less attractive to the eye. There are others which seem to advertise themselves as dangerous. The hemlock, for instance. If you pinch a leaf it gives out a nasty, mousy odor. One need hardly state that it is very poisonous, being a powerful narcotic. The sufferer sinks into a drowsy state, which, if remedies are not at hand, ends in death.

"All the nightshades have a sinister appearance and should be avoided altogether. There are also many common shrubs of which tho leaves, if eaten, produce unpleasant results. Among these are the common privet, the elder, holly and laburnum.

"Plane-tree leaves will cause in some people an illness resembling a bad attack of hay fever, and this not through chewing, but merely handling them. The eyes become red and swollen, while nose and throat are sore and inflamed.

"Quite a number of plants are possessed of short hairs in their stems or leaves, which will cause a rash to break out upon sensitive skins. One such is the Primula obconica, which is one of the commonest pot plants in greenhouse or on window sills.

"Bulbs of the Roman hyacinth are covered with a sort of light scale, which comes off on the hands and sets up an unpleasant irritation which sometimes spreads up the arms.

"Many who work in coservatories or glass houses often find that hyacinths cause severe eye trouble. The idea is that the pollen is the irritaing cause."

CLAUSEN RETURNS FROM OVER SEAS

C. P. Clausen, entomologist and assistant superintendent of the state insectary prior to his enlistment, has returned to Sacramento. He saw active service with the 54th Artillery, U. S. A. Expeditionary Forces in France. Mr. Clausen expects to resume the same duties with the new department of agriculture in which he engaged under the commissioner of horticulture at the time of his enlistment. While in Paris, he visited the parasite laboratory in Rue Claude Bernard and spoke with Dr. Paul Marchal, with whom the state insectary is cooperating with regard to insect pest control.

Do not try to see how many flowers may be packed into a vase, but rather how few. Often one flower makes a more attractive a vase as a dozen.

This Month in the Vegetable Garden

Southern California

By D. F. Reichard

MANY have been disappointed with their gardens the past summer because they have not seemed to flourish as usual. Do these people realize that the rainfall last winter was only one-half of normal and that the ground did not have a thorough soaking during the whole season? The time is now at hand to put in the fall and winter garden. During September the greater part of California's winter vegetables are planted.

The handling of the soil is very important in getting the seed to start and establish itself. Flood or thoroughly soak the land to be used before working it up, pulverize the surface and let it lie for a week. As sections are to be used soak them and work again, thoroughly pulverizing so as to make a good seed bed. Sow the seed at once before there has been much opportunity for evaporation. Sow seed deeper than in the spring because the ground dries out faster at this time. It is a very good plan to furrow out, planting the seed on the ridges. Then after a few days irrigate by letting the water run slowly down the furrows. This method gets the moisture to the sprouting seed without wetting the ground over it. Cultivate the furrow as soon as the ground works up nicely.

It is getting late to plant any of the tender crops except in particularly favorcd spots, although I have planted sweet corn on September 9 and had green corn for Thanksgiving and Christmas in the eastern end of the San Fernando Valley. Canadian Wondcr beans would do as well if we had a mild fall. But this is taking chances. The safe things are the hardy root and heading crops. Carrots, beets, turnips, parsnips, kohl rabi and salsify all do well during the fall months, and if planted during September are ready for use from December on. Besides the root crops mentioned spinach and lettuce are grown very extensively for shipment to Eastern markets. Cauliflower and cabbage seed are sown this month for the main crop which comes off during February and March. Early onions are also put in this month by starting the seed in seed beds for transplanting later. The minor vegetables, mustard, parsley, radishes can all be put in for good results.

Do not plant pole beans, okra, squash, potatoes or other tender stuff; cold weather will come on before it can mature.

Keep all stuff in the garden well irrigated and cultivated for continuel growth and development.

Northern California

By A. R. Gould

ALTHOUGH we are nearing the end of the summer season there is no reason for relaxing efforts. Active preparations should be made with a view to having a few hardy vegetables for the winter months, and the ground should be made ready for these with as little delay as possible. Then we still have many crops to harvest and store away for the coming winter and it will be necessary to use every care in the selection of the root-crops for winter storage, as anything showing disease or being damaged in any way should be discarded, for they may cause the loss of half the crop stored. We gave particulars of method of storing last month, and those crops such as beans (Green Pod), tomatoes, turnips, carrots and many others may be preserved by the evaporation method now rapidly coming into use. Tomatoes may also be canned, small onions and cucumbers pickled in vinegar. Dry beans, all varieties, should be collected and stored in a dry place, which also applies to peas. Most of the squash and pumpkins will keep for many months if stored in a dry cellar.

Do not fail to keep a record of the crops harvested, also the location in the garden where grown. This is important if you would avoid planting the same crop in its former location again. As soon as the plots are cleared, deeply trench with manure to put them in shape for the next crop. The wise gardener always looks ahead, and whenever he looks behind it is at his past experience, and it is these careful observers who are successful. The great secret of success in the working of soil, and the most important operation, is trenching or moving it to a depth of two to three fect, and even more if conditions permit. This will assist drainage and aeration and will render it workable and fruitful. It is sound practice to bring the subsoil to the surface when trenching, to thoroughly mix this with the top soil. Lime may be applied with advantage to most soils, also soot and ashes. These should be forked in the surface after the trenching has been done.

Celery

Those plants put out early will be ready to blanch this month, and by this we mean that the stems may be made white and crisp by tying thick paper around them. Sometimes the soil is drawn up for this purpose. Any plants showing signs of attack by insects should be thoroughly dusted with arsenate of lead in dry form. Continue to water this crop with soot water or some good liquid manure.

Leeks

For blanching the same treatment as advised for celery will apply, and all forward plants should be so treated. Water with liquid manure at least once a week, as this crop is a very heavy feeder. The leek is practically the most hardy vegetable we have. It is unharmed by frost and will last all through the winter season. Unfortunately its value is little known and it is not nearly enough grown or appreciated.

Tomatoes

The season for picking is now at hand and they will ripen fast if some of the foliage is cut out where it is too rampant. Avoid overhead watering as there are still many flowers on the vines which should set fruit. Do not pick the fruits too green this month as they will ripen better on the vine than off, and be careful not to bruise the fruits. Remove any showing signs of tomato spot disease quickly and destroy these with a strong solution of sulphur or bury with quick lime. Any of the diseased fruits lying around will be a menace, and the spores when once in the ground will cause trouble in the future.

Beets

Sow for winter use Detroit dark red or Improved Blood Turnip. Have the ground prepared with well rotted manure and sow in rows 18 to 20 inches apart. Later thin out in the rows. It takes about two ounches of seed to sow a row 100 feet long. Roots of this crop now matured should be dug and stored.

Beans

Dry beans should be collected and kept in their respective varieties and may be used for seed as well as for cooking. A sowing of the Broad Windsor bean may be made now, also the Canadian Wonder, a well flavored green pod which is fairly hardy. Have the ground well cultivated before sowing.

Kale

Plants of these may be put out from sced bed, and those who have poultry should plant as large an area as possible as it makes the finest green food

for the winter as it is very hardy. It is also excellent as a table vegetable.

Brussels Sprouts

If these were not planted last month as advised plant them 18 to 20 inches apart in rows 24 inches apart. They delight in rich soil and require a fair amount of water. At the end of this month another sowing should be made to provide plants which will give a succession.

Lettuce

Sow White Paris Cos and New York or Los Angeles very thinly broadcast on a well prepared bed and afterward plant out in rows as desired.

Squash and Pumpkins

Many of these may now be harvested and stored in the cellar or a dry shed.

Cabbage

Make a sowing of Autumn King and American Savoy for winter use.

Carrots

Follow up your beans with carrots, Danver's Half Long or Early Shorthorn. Sow the seed thinly in rows 18 inches apart.

Potatoes

Complete the digging of this crop and store the tubers for future use in dry earth or sand. The later crop should be well culttivated and irrigated.

Strawberries

Prepare new beds for this profitable crop and have the ground well trenched and heavily manured. Many young plants will be available and should be removed from the parent plant to set out during the month. Plant in rows 20 inches apart.

Onions

Complete harvesting this month. The bulbs should be tied or roped together by the dried tops and may be hung up for future use in a dry shed. In this way they will last for months. Use every care that the bulbs do not get bruised.

This Month in the Ornamental Garden

Southern California

By A. Layman

SEPTEMBER is one of the best lawn making months of the year. Notwithstanding that, it is probable that the greater number of our lawns are made in the spring time. But if the site of the lawn has been kept thoroughly moistened during the past few weeks and the weeds hoed off as fast as they appear, the making of the lawn during the month of October gives the grass time to start and get thoroughly established before the mass of weeds which start in the spring time can crowd out the blue grass or white clover.

Spade deeply, irrigate, after a few days firm and settle the ground so as to secure perfectly even surface, rake off surface stones, even small pebbles. When seed bed is perfectly prepared seed with blue grass or with blue grass and a small quantity of white clover as preferred, at the rate of, say, one pound of blue grass to every 200 square feet of space. A pound of white clover will sow 300 square feet.

The raking in must be very lightly done or the seed will be buried beyond recovery. An exceedingly light mulch of thoroughly rotted manure is fine. We have seen lawns made which were mulched with dry dust-like scrapings from dairy corrals. This is good but calls for a vast amount of hand weeding because of the weed seeds carried in the manure. Give light sprinklings two or three times daily according to weather conditions. Weed as necessary, mow when high enough, trap the moles, and by Thanksgiving a beautiful lawn will be had.

If the old lawn has been neglected through the summer this is a good time to rake in new seed, plenty of fertilizer, raw bone meal or, rather, thoroughly pulverized bone "flour," which makes an exceptionally good dressing.

Divide the old iris; plant new. This is an ideal time for such work. It will soon be time for planting daffodils and other spring blooming bulbs. so that the ground may be well moistened and spaded in preparation for this beautiful flower. Gladiolus which are through blooming may be removed and the bulbs dried off for December and January planting. In case of highly desirable varieties use extreme care in saving the tiny corms which have formed around the old bulbs. Gladiolus "runs out" if one simply depends upon the old stock, and these little corms are the foundation for new and more vigorous bulbs.

Watsonias should be divided at once; they will give a glory of bloom next April and May. Amaryllis may be divided as soon as it finishes blooming.

Golden glow is blooming. Quick acting fertilizer and plenty of water make a perfect glory of this plant.

This is the period of the year when chrysanthemums demand greatest care. If large blossoms are desired, disbudding, fertilization, staking, and irrigation must all be attended to.

The sowing of annuals is always in order in California. Especially is this a desirable time to scatter freely the seed of our California state flower, the golden poppy. Let every waste space be filled with seed, and fall irrigation will give an early start to this wonderful flower.

Northern California

By A. R. Gould

AUTUMN tints that beautify the foliage of most deciduous climbing plants and trees will soon be the prevailing features in our gardens, and much of this can be used with good effect in vases or for decorations. Most of the summer flowering annuals are past and for fall use we now rely on our perennials; Michaelmas daisies, golden glow, erigeron, gerbera, etc., and just now the dahlias are the mainstay. Later on two useful annuals will be evidence; Tithonia speciosa, the Mexican orange zinnia-like flower, and cosmos in double and single form, and these by the way will need staking as both subjects grow tall and have slender branches which will readily break with the wind. A careful watch for that frequent visitor, the aphis, green, brown and black, should be kept and it should be met with a spray of Blackleaf 40, the nicotine solution. The diabrotica and four-lined bug should be hand picked from the dahlias and other blooms which they attack. Slugs will also find a hiding place in the clumps of delphiniums and other perennials. They should be destroyed where possible, and hand picking these is the most effective way we have discovered yet and we have hunted them for years. Where there is an abundance of water the lawns should not be neglected, and any bare spots should be re-sown after being well raked, and sand should be applied after the seed is sown. Any worn-out lawn can also be restored by the application of dried blood, sulphate of ammonia, or nitrate of soda, which should be applied mixed with sand or fine soil carefully.

Chysanthemums

These useful autumn flowers are now showing their buds very freely,

Heider

11 Years Actual Field Work

For eleven years America's leading power farmers have used the Heider in every kind of tractor work. Heider principles have been tested by time and found to be absolutely correct.

No Gears to Strip

With tho Heider Drive the power is taken directly from the flywheel by two large metal discs at either side—one to go ahead, the other for reverse. No jerking, no vibration, no gears to strip. Tractor always in "mesh." Seven speeds forward and reverse, all with one motor speed and one lever for traction or belt.

MODEL D 9-16
With Rock Island No. 9 Power Lift Plow Attached. One-Man Outfit.

15 to 20% Fewer Parts

The fewer the parts through which the power has to travel, the more power delivered at drawbar or belt. Heider Tractor's simple construction does away with 15 to 20 per cent of parts. It does away with clutch, transmission gears and bevel gears. This leaves the maximum power for pulling plows and harrows, for hauling loads, for every farm job—with less fuel and less upkeep expense.

Two sizes, 12-20 and 9-16. Send for catalog of Heider Tractors and Rock Island Tractor Tools; the famous Rock Island Tractor Plows, 2, 3, or 4 C. T. X. bottoms, and the Rock Island one-man Tractor Disc.

ROCK ISLAND NO. 38
One-Man Tractor Disc Harrow
Operated from Tractor Cab.

WADE'S New Pea and Bean THRESHER

A thresher with a more powerful blower; the air currents properly directed and concentrated; draft controlled by improved damper; larger than ordinary cleaning space with output greatly increased; and perfected sacking attachment, briefly describes the new WADE Pea and Bean Thresher upon which patents are now pending.

Western Made For Western Trade

This improved WADE Thresher was developed here in the West where the extreme growth and toughness of the pea and bean vine made slow, and at best, unsatisfactory work, of threshing with the old style machine.

WADE Built Throughout

"Better than seems necessary" construction, is carried out in every detail. The price is no higher than on ordinary machines. Post yourself fully on the WADE'S many exclusive features by writing for your copy of the late booklet. Write at once.

and while we wish to have and must look for, small flowers in some varities such tho pom-poms or button types and many single forms, we aim to have large flowers in the curved and reflexed types, and on these we leave the best bud to provide our prize bloom. On some of the more bushy types we thin out a few buds, leaving three to five on one branch. This work of disbudding should be attended to, and all of the large flowered types should be given overhead protection by a covering of cheesecloth. The plants will also need feeding at least twice a week with liquid manure or soot water and any signs of green fly or aphis should be removed by spraying with nictotine.

Freesias

These are our earliest bulbs and the most fragrant. They multiply very rapidly once established. Bulbs may be secured and planted now in the open ground, while a few may be placed in fairly rich soil in pots for flowering in the house. These pots may be plunged in ashes or sand for the first few weeks to encourage root action. The best varieties are Improved Purity and Barr's Primrose.

Seed Collecting and Sowing

Many annuals such as marigolds, African and Freneh, calendulas, ageratum, cornflower, etc., will be past blooming and mueh seed can be eolleeted from these; also from sueh perennials as Oriental poppy, erigeron, hollyhock, columbine and gaillardia. Seeds of the perennials named may be sown at onee for spring plants; also ealendula which is very hardy. Other seeds to be sown now are pansy, forget-me-nots, alyssum, aubretia, arabis, gladiolus, wallflowers, English daisy and stocks for winter flowering.

Primulas

The primrose family is a very large one and includes many popular types, amongst which are primula veris and P. vulgaris, well known types, P. vulgaris coerulea, a rare blue form sported from the yellow, or English primrose, P. malacoides, a charming form of delicate pink and lavender shades, P. Kewensis, now being largely planted; a fine yellow verticillate type and effective for massed groups, P. Obconica in various shades, noted for its long period of flowering, and P. polyanthus, well known hardy flowers. All these are worthy of a place in your garden, and plants should be seeured as soon as possible. They will all thrive in semi-shade and should be planted in fairly rich soil. Sceds of most of the above may be seeured and sown at once if this method is desired, but your nurseryman ean usually supply strong plants for fall planting.

Sweet Peas

The winter flowering types as mentioned last month may still be sown as advised.

Flowering Shrubs and Roses

Go over these very carefully and prune out any dead wood. Seeds of the Spanish broom, acacia, etc., can be collected and sown. Any black scalo should be sprayed with kerosene and soap emulsion with nicotine added. Cut off any dead flowers and water to encourage new growth.

Bermuda Onions

By J. Paul Hatch

Among both growers and eonsumers of onions in Southern California Bermudas have beeome a favorite.

The extreme mildness of flavor, its adaptability to growth in our winter elimate, early maturity and heavy yield make a eombination of good points which wins their way everywhere. Bermuda onions, the pure white or crystal wax, and the white or yellow skin, are well known in Coaehella and Imperial Valleys, where many earloads are shipped out every year. The Bermuda onions are also becoming well known on the coast. The planting of seed in Coaehella and Imperial Valleys is usually done from the latter part of August up to the end of October for an early spring crop. On the seeond day of April, 1914, I saw Japanese loading out the first earload of new Bermuda onions from Brawley, for that year. And later years the new erop has begun moving in the month of March there. About seven years ago the growers used to figure the returns per aere for Bermuda onions, with a good market price holding out through the season, at over $400, while the price the past two years has been higher than usual. Bermuda onions will produce from 300 to 800 erates, or expressed otherwise, from 150 to 400 sacks of onions per aere. They do well for the large grower, small truck gardener or in the home garden.

The seed is usually planted with hand pushed drill seeders in rows 14 to 16 inches apart for single rows, or for the double row system, two rows six inches apart with 18 to 24 ineches space between. The plants when the size of a peneil should be thinned out, leaving three to four inches apart in row. When the onions reach maturity, the tops will begin to wither and fall. No need for tramping or other smashing down with risk of injury to bulbs.

Harvest by hand for a small patch or use horse and cuttor sled to eut under a few rows at a time, then gather up and trim tops and roots by hand and pack in crates or sacks for market. On land near the coast and in back country where average rainfall is about 15 inches, Bermuda onions ean be raised without irrigation if planted early enough.

Here in Escondido I planted one pound of yellow skin or white Bermuda onion seed on November 20, 1918, over a month later than I should have planted it, so as to got more benefit of the rainy season, and I planted this seed on just one-sixth of an aere of ground and sowed the seed a great deal thicker than necessary in order to use all of the seed on that particular piece.

On aecount of planting as late in the fall as I did, I irrigated just onee in the month of May and I figured that I had only a fair yield of 50 crates, but the price being good they sold well. During the month of April and May I sold $25 worth of green bunch onions, and during the month of June $105 worth of dry onions, or a total of $130 worth raised on one-sixth acre of land. I might add that now I am beginning to harvest a crop of turnips, lettuce and carrots raised on same piece ground since the onions were harvested.

WORK IN MY GARDEN

"This is a busy month, to be greatly enjoyed as a time for starting the growth of so many lovely flowers," says Fanny L. Ryan in California Garden.

"Winter blooming sweet peas should now be planted in well prepared soil, and if kept well fertilized and watered should bear flowers in ten weeks.

"Now is a good time for planting freesias, oxalis, Spanish iris, ranunculus, anemones, amaryllis, paper white narcissus, watsonias, Roman hyacinths, the various lilies, especially paryii and humboltii, both native, calochortus, babianas, callas and the pretty gladioli of the Colville type. It is a small-flowered type and of two varieties, white and rose-colored. These bulbous plants, if properly cared for, will make the garden glow from November to May.

"For annuals plant pansies, mignonette, stocks, scarlet flax, calliopsis, sweet alyssum, phlox drummondii calendulas, scabiosa, a perennial in this country; auriculus, also perennial of wonderful beauty; poppies and perennial larkspur.

"To start the seeds of all these successfully in our dry climate, a covering of sawdust an inch deep will save much time and labor. It is so light the little seedlings can prick through it and it will act as a mulch while they are growing, and prevent the soil from baking."

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and give full name and address. Unsigned communications receive no attention.

Fraudulent Seed

I wish to ask two questions which I think would be of interest to quite a number of your readers. One is this: When I buy Peruvian alfalfa seed at 42 cents per pound and it turns out to be the common alfalfa which I could have bought at the same time at half that price, what recourse have I? The second question is along the same line and is this: When I buy certified seed potatoes and get two or three different kinds, all mixed together, what can I do about it? I bought both the alfalfa and the potatoes from a local firm which got the seed from one of the big Los Angeles seed houses. It seems as if there should be some way to get back at these fellows.—Subscriber, Elsinore.

We believe that all nurserymen and seedsmen "give no warranty, expressed or implied, as to description, quality, productiveness or any other matter of any seeds, bulbs, plants or trees they send out, and they will not be responsibile in any way for the crop. If the purchaser does not accept the goods on these terms, they are at once to be returned." Hence we take it there is little chance for collection of any damages in such a case. There should be, however, opportunity for collecting the difference between price of seed bargained for and seed delivered, for no matter how many reservations a merchant may make in his guarantees there can be no cover for direct fraud.

An Unjust Husband

This department is in receipt of an extended letter from a subscriber, a woman who does the milking and at times the feeding and all work connected with a dairy of ten cows, even to separating, besides doing all of the housework and much other of even the heavier outside work. She chronicles the fact that "We came to California from Omaha ten years ago. At that time he gave me $1 to buy a hat, and in all of those years I have not had another. . . . In all that time I have not had a new coat or a dress that cost over $1." Other points are given in the letter showing that the wife and homemaker has not had as much consideration as has the live stock on the ranch, but the question of such treatment is entirely outside the jurisdiction of this paper other than to call attention to the fact that such a man is not worthy of the blessings of living in a free country.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Workmen's Compensation

I wish to have my house painted and hire a contractor who has men under him to perform the work. Do I need to insure the contractor under the state compensation fund? If he should be injured, would I be held responsible?—Subscriber, Burbank.

The term "employe" under the workmen's compensation act excludes any person whose employment is both casual and not in the course of the business of the employer. The term "casual" refers to employments where the contemplated work is to be completed in not exceeding ten working days, and the total cost of such work is less than $100. An independent contractor such as this man would be is very probably also excluded from the act, although it would seem that if he receives wages irrespective of profits, he might be deemed an employe, however, as your work would fall within the term of "casual" it would clearly be unnecessary for you to insure.

Filing On Spring

A owns property on which there is a spring. Between the land of C and A there is a piece of land owned by B. The spring has never been used by A. Can C file on the spring and obtain a right of way over the land of A and B?—Subscriber, San Jacinto.

If a right of way can be purchased from A and B there seems to be no objection to C filing on the spring, but he could not obtain such right of way except with the consent of A and B. If you should file on the spring it would be necessary for you to do so by petition to the state water commission.

Note from Husband to Wife

A man gives his second wife a note covering the value of the property which she possessed before marriage. Her property is then transferred in his name. If he dies intestate leaving two children by his first wife, can she collect on the note from the estate? Would it make any difference whether the note was dated prior to or after the marriage? Is there a limit to the time for which the note may be drawn?—Subscriber, Claremont.

The note being given for a valuable consideration, the wife could undoubtedly prove her claim against the estate at the time of the death of the husband. It would make no difference whether the note was given prior to or after the marriage, but it should be given contemporaneously with the date of transfer of the property. There is no limit of time for which the note may be drawn, in fact some railroad mortgage notes are drawn for as long as 99 years. The plan suggested is, however, very liable to lead to trouble both during the marriage and subsequent thereto. The wife would stand merely as any other creditor, and the note would be just as good as the estate which was left and no better.

FIGHTING WEEDS WITH FENCES AND SHEEP

"County Horticultural Commissioner Earle Mills made an interesting report to the board of supervisors of Butte County recently," says Weekly Newsletter of the state department of agriculture.

"The report was the result of a petition that had been filed with the supervisors by some 40 water users of the Sutter-Butte canal to the effect that the sides of the canal were infested with Johnson grass and that the ripening seed was carried onto the lands of the users.

"Mills stated that he had investigated the canal and found the condition of which the water users complained to be true. He further stated that he had interviewed the Sutter-Butte Canal Company officials and found them ready to proceed with a plan by which it is believed the Johnson grass menace will be entirely done away with in a short time.

"The plan is that the company will proceed to fence its entire system of 112 miles. A fence will be run on both sides of the canal system at the edge of the right-of-way, thus fencing in on both sides of the canal a narrow strip of land. Into this enclosure, the canal company will put sheep. From 500 to 700 head of sheep will probably be placed in the long narrow enclosure and will be alowed to feed off the banks of the canal. In this way the Johnson grass will not be permitted to go to seed as the sheep are close eaters."

TiziT TiziT

For the Orange Tortrix...

Mr. H. J. Ramsay, head of the field department of the California Fruit Growers Exchange and Mr. R. S. Woglum, entomologist of the U. S. department of agriculture recommend the use of Lime Sulphur plus Arsenate of Lead for the control of the Orange Tortrix or the smaller worm which resembles the Tortrix, both of which puncture the orange rind and cause the fruit to decay in transit.

The chemical elements entering into the manufacture of Tizit Spray, viz: Arsenate of Lead and Sulphur, make it peculiarly suitable for the purpose of controlling the above mentioned pests.

By using Tizit you do not have to mix different materials in your spray tank, nor do you have to worry about getting the correct amounts to insure successful control without injury to tree or fruit.

Tizit will not only control the Tortrix pest but will free your trees of Black Scale and Fungus, all at the cost of one spraying. Scores of Tizit sprayed groves examined for Tortrix failed to show a single punctured orange.

Don't experiment—Use Tizit.

The Tizit Spray Mfg. Co.

50 Registered Holsteins 50

at Public Auction

Having leased their ranch, Ageo Bros. will sell at public auetion 50 registered Holstein cows, heifers, and bulls, at

Holtville, Imperial County, California

Wednesday, October 8, 1919

This is a well bred offering, and the females are practically all in calf to the richly bred bull Toyon Fayne Caldessa, who is by the 41 pound bull King Valdessa and out of a 30 pound 4 year old daughter of King Hengerveld Aaggie Fayne.

The offering of bulls is an excellent one, and should be particularly attractive to dairymen in Imperial and other southern counties, for it is not often that so desirable a lot is offered at auction so close to home.

Catalog in preparation. A copy free on request.

Finderne Soldene Pontiac Valdessa

— The Bull with the Backing —

The Names of 10 World's Record Cows Appear in His Pedigree

FINDERNE HOLINGEN FAYNE—Butter in 365 days at 3 years old, 1395 pounds. World's three year old record.
FINDERNE NETHERLAND FAYNE—Butter in 365 days at 27 months old, 1200 pounds. World's record two year old.
(Will this record ever be excelled?)
LUTSCKE VALE CONUCOPIA—Milk in 365 days, 31,246 pounds. World's record when made.
SEGIS FAYNE JOHANNA—Butter in seven days 50.68 pounds. World's record when made.
FANCHER FARM MAXIE—Butter in seven days at four and one-half years old 46.84 pounds. World's record.
K. P. PONTIAC LASS—Butter in seven days, 44.18 pounds. World's record when made.
VALDESSA SCOTT 2D—Butter in seven days, 41.88 pounds. World's record when made.
FINDERNE SOLDENE HENGERVELD—Butter in seven days 35.34 pounds. World's record for heifer with first calf.
GRACE FAYNE 2D'S HOMESTEAD—Butter in seven days 35.55 pounds. World's record when made.
MABEL SEGIS KORNDYKE—Butter in seven days at four years old, 40.32 pounds. World's record.

We have his sons and daughters for sale, one to a carload; also some extra good young cows and promising heifers bred to him. 225 head to select from.

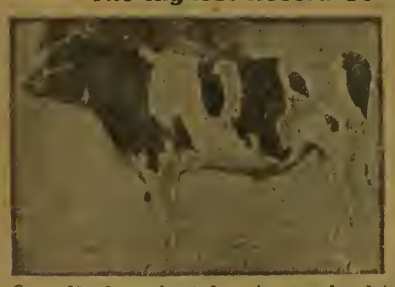
CAN YOU BEAT IT?

Geo. A Smith & Son

Corcoran, Cal.

Prince Walker Cornucopia

The Highest Record Son of Prince Gelsche Walker



His dam: ALBA SADIE CORNUCOPIA CREETA has just completed official records of 36.26 pounds butter from 516.7 pounds milk in seven days. Her previous records were as follows:

At seven years—	
Milk 338 days	18,849.40
Butter	866.28
At six years—	
Butter seven days	34.13
Milk	532.40
At five years—	
Butter seven days	28.85

She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

Shorthorn Progress in California

By R. P. Royce

THE development of the cattle industry of this state has followed a rather unusual trend. In a section with a vast area adapted only to range operations, with natural conditions not paralelled in any other section that make it possible to have a twelve month growing year, considered from the earliest times as a leading cattle state, one might naturally expect that the industry would have been accorded every phase of management calculated to improve and make more profitable a business of such first importance. It is a lamentable fact, however, that only in the case of a few operators was any special effort directed toward improving the old methods handed down by the Spanish ranchers.

Perhaps the very fact that conditions were so near ideal as to make it possible to operate with a minimum of grief accounts for the backward development the industry must confess.

Here is the situation that has existed and still exists to a large extent. With a beef cattle population that runs into the hundreds of thousands (the estimated number at the present time is around 1,700,000 head) and a consequent need for hundreds of bulls annually, the state has never produced one-tenth the number required in pure bred bulls. Of course it is true that up to the present time by far the majority of the bulls used have been grades, but the fact remains that cattle outfits using pure bred bulls have been forced to secure them in other states.

The trend of the times indicates that from now forward there will be an increasing demand for pure bred bulls, and eventually it can be predicted that registered bulls will be in the majority. It has been estimated that with our present cattle population about 75,000 bulls are required, and of this number from one-half to one-third need to be replaced each year. There is therefore a tremendous market waiting to be supplied. It may seem strange in view of the above facts that the pure bred business has not developed faster. There is slight question that the logical development has been materially retarded by the coast markets. The markets have never been such as to put much of a premium on quality. Under the old time practices a steer was a steer, and while there is still much to be desired in the way of improved markets, advancing costs of production are causing cow men to look to the pure bred bull to cheapen their costs.

There is another factor that it seems would have stimulated pure bred herds in this state. In a way California occupies a sort of isolated position as regards the established centers of pure bred production. Situated at the extreme western edge of the country, the added cost of buying bulls in the Middle West and shipping here is so great as to lead to the assumption that every effort would have been made by the cattle interests to establish breeding centers nearer the base of their operations.

Strange as it may seem, one does not need to hark back many years to a time when the Shorthorn herds of California, herds that were real factors in the breed, could be named on one hand.

During the past few years, particularly during the past three years, there has been a marked growth of interest in all classes of live stock, and no breed has come in for more interest than the Shorthorn.

More new herds have been established during the past three years than during any other ten years, and among the new herds are a number that have been established upon a foundation such as to give the greatest confidence in the future of the breed. It is a safe assertion that the past 12 months have witnessed the most active extension of Shorthorn breeding ever known in this state, and it is equally conservative to state that the next year will see even a wider growth.

A few of the principal events that led to the above remarks may be recounted. A California bred and raised steer was champion Shorthorn steer at the 1918 International. The second annual spring sale held by the California Shorthorn Breeders' Association established a new sale record for the Pacific Coast, and in that sale a "home bred" bull sold for $5500, which is the highest price that a bull of any beef breed ever fetched on the Coast. That sale not only started many new breeders with Shorthorns but resulted in the establishment of at least one herd that is bound to have a large influence on the breed. Reference is made to Conaway Ranch herd of which C. Harold Hopkins is manager. The Conaway Ranch is one of the large properties of central California, consisting of 27,000 acres, and it is proposed to develop a thoroughly first class herd. The sale also indicated a keener appreciation for real worth than has been manifested before.

Following the association sale W. M. Carruthers of Live Oak sold 39 head for an average above $800, a new high record for the far West. Again, in this sale a number of men made their first purchases.

Quite recently Edward Cebrian of San Francisco, who has acquired one of the largest and what is generally admitted to be one of the choicest collections of Shorthorn females, has brought to this state two of the best bulls available. Mr. Cebrian has secured the three-year-old Caledonia, imported by Peter Ross, for awhile at the head of the Gillespie herd in Oklahoma, and until coming West, at Anoka Farms. The second bull is the outstanding son of Gainford Marquis. Gainford Matchless, first as a senior yearling at the last International. The addition of two bulls of such acknowledged worth is certain to have a marked effect on the industry in this state.

Since last spring Messrs. Easton & Ward, owners of the Blackhawk Ranch, Diablo, and who have long been identified with Shire horses, have purchased a foundation herd of high class Shorthors with the intention of building one of the top herds of the West.

A number of smaller herds have been started and a number of very substantial men are making plans to take up the breeding of Shorthorns.

While many new herds have been launched, the older herds have all been strengthened by the addition of high class breeding material. The Hillcrest herd of Thornton H. Gilde, which is one of the oldest herds in the West, has acquired an imported bull, and the San Julian herd owned by the Thos. Dibblee Estate has added a number of imported individuals.

At present the tendency appears to be, for obvious reasons, to found the new herds on Scotch families, but as yet there is no evidence that breeders will be carried away by pedigree fads. While the preference is being given Scotch breeding and values reflect this preference, Western breeders are intensely aware that their outlet will depend on the estimation of their cattle by the practical range man who primarily looks for beef, scale, constitution and bone regardless of whether the pedigree reads "straight Scotch" or is rated "plain." So while California breeders would prefer Rosewoods, Augusta Victorias and other popularly rated families, they insist that first of all "the papers" belong to an animal of merit.

Another encouraging feature in this state is the increasing interest the smaller ranchers are displaying in Shorthorns. Up to quite recently most of the pure bred herds have been owned by large operators and the man with small acreage has usually gone in for dairying. But the problem of labor for dairy farms is becoming so acute that many are thinking of turning to beef cattle as a way out.

Again, the idea long held, that beef cattle are not profitable on high priced irrigated land, land selling for $250 to $400 or $500 per acre, is fast giving way in the face of facts.

As a whole the Shorthorn business in California is on a highly satisfactory basis. The breed is in the hands of high class men and is attracting others of like calibre. The California

Shorthorn Breeders' Association which controls to a large extent the destiny of the breed, is making every effort to keep the business on the high level it is on now. This association is sponsoring every movement calculated to extend the business on a sound basis. Small herds are encouraged, and the association through its annual sales furnishes an outlet for the surplus bulls. There is a fine spirit throughout the business that is worth much. So far there has been no evidence of speculation.

In closing attention should be called to the constructive work directed by the college of agriculture to the entire pure bred live stock industry. Through the showing made by that institution at the International great impetus has been given all breeds.

This year for the first time there are to be three big live stock shows, the California State Fair, the Los Angeles Live Stock Show and the San Francisco International Live Stock Show. The influence of these shows will be wide and responsible for attracting many new men to the business.

The time is not far off when California Shorthorns will hold a prominent place in the affairs of the breed.

October 21. Tulare County Poland-China Breeders' Association, Tulare.

Alex Whaley, Tulare, has a herd of registered Holsteins from which high production may be rightfully expected. Among the younger things are a number of granddaughters of Segis Pontiac De Kol Burke and a daughter of Sir Veeman Korndyke Pontiac out of the 30 pound cow Melba Hengerveld. Mr. Whaley's 25 pound two year old, Eldorado Winifred, daughter of the 32 pound cow Winifred Hotaling 3d, looks promising for a large record later on. The head of the herd, Sir Aaggie De Kol Acme 2nd, has the distinction of having the highest average in the world, for a bull of service age, for butter produced both in one year and two years by five of his seven nearest dams. He is by the same sire as the bull that sold in the Philadelphia sale for $11,000.

W. J. Higdon, Tulare, now has a herd of registered Holsteins that ranks as one of the greatest in the West both for production and type. Ten records from 30 to over 34 pounds butter in seven days have been made by cows and heifers in the herd, while yearly records range to over 1000 pounds butter. The senior herd sire Prince Riverside Walker is by Prince Gelsche Walker and out of that great old cow Aaggie Acme of Riverside, who recently increased her record to 1053 pounds butter in one year, and who is the dam of the world's official yearly butter record cow Aaggie Acme of Riverside 2nd. The junior sire is King Korndyke Pontiac 20th, son of Miss Valley Mead De Kol Walker, the great daughter of Prince Gelsche Walker that has broken two world's records as a heifer. Both of these bulls are getting a very choice lot of calves, some of which stand in the very foremost positions in this state both as to breeding and individuality.

Walter F. Mitchell, Visalia, will soon be milking a bunch of registered Holsteins again, despite the fact that he sold off his milking cows last May. The splendid daughters of Prince Hiske Walker are growing up rapidly, and Mr. Mitchell's herd also contains some very choice heifers by other sires, among them some daughters of the famous bull It. The herd is now headed by the $5000 bull King Abbekerk Johanna Segis, whose dam is the 41.02 pound cow Adirondac Wietske Dairy Maid.

V. F. Dolcini of June Acres Stock Farm, Davis, has just added to his Holstein herd a bull and eight heifers. To head his herd of good young females Dolcini purchased the richly bred bull Sir Aaggie Korndyke Mead whose sire is Sir Aaggie De Kol Acme, the famous son of Aaggie Acme of Riverside 2nd, whose strictly official record of 1331.78 pounds butter in one year is a world's record. The dam of Dolcini's bull is Lady Mead Salambo who made 950.01 pounds butter from 22,097.8 pounds milk in one year, she a daughter of King Mead of Riverside and out of Pet Salambo of Riverside who made 1003.28 pounds butter from 22,287 pounds milk in one year and who has another daughter going at a 1000 pound gait this year. Five of the seven nearest dams of Sir Aaggie Korndyke Mead average 1096.28 pounds butter in one year, placing him well up among the best bred yearly record bulls of the breed, while five of his seven nearest dams also average 30.89 pounds butter in seven days. One of the strongest points in his pedigree is the fact that ten of his 14 nearest ancestors have produced daughters with records above 1000 pounds butter in one year. The females in the herd will be put on test regularly as they freshen, and by breeding them to such a high class bull Dolcini is preparing to reap the benefits of highly bred Holsteins much earlier than falls to the lot of the average breeder. Sir Aaggie Korndyke Mead is by the same sire as the bull that sold for $11,000 at Philadelphia in June and is also a three-quarter brother to the great young bull Sir Aaggie Mead recently purchased by Toyon Farm Association, Los Altos, for service in their top notch herd. The heifers trace twice to Pontiac Korndyke on the sire's side and to Juliana King of Riverside on the dam's side. Their grandsire is a three-quarter brother to Rag Apple Korndyke 8th who recently sold in the East for $60,000.

This blood combined with the Prince Gelsche Walker and King Korndyke Sadie Vale blood already in his herd ought to put Dolcini forward in the ranks of Holstein breeding.

A. D. Severe, a breeder of Poland-Chinas in Iowa, on his recent trip through the state, stated that The Yankee, Jr., was one of the best sons of the The Yankee that he had seen. In the sale of Williams Brothers, owners of The Yankee, held August 6 one of his sons, a September pig, sold for $1200, and two January pigs sold for $750 and $535.

In the sale of Monroe McCoy and Son August 1, the top of the sale was a son of The Yankee that went to R. A. Welch of Red Oak, Oklahoma, for $3500, and two sows in the sale, by The Yankee, sold for $405 and $450. John M. Bernstein secured a son of The Yankee, The Yankee, Jr., as a running mate for his well known boar President. He also secured 40 or 50 big type sows and gilts. The tops of these and some daughters of the President will be offered in the sale he and W. L. Haag and Son will hold, and will be bred to The Yankee, Jr.

As the blood of The Yankee is so much in demand Mr. Bernstein believes he is rendering the breed a service in introducing the blood into this state.

Henderson Company, Sacramento, has made very substantial progress during the past year, both in respect to its farm and its herd of registered Holsteins. The herd now numbers 333

STATE FAIR GROUNDS

SACRAMENTO, CALIF.

Tuesday, Sept. 16, 1919

Preston School of Industry, Ione, Calif., will disperse its entire herd of registered Ayrshires in this sale, affording buyers an opportunity to secure representatives of this good breed for the first time at public auction in California. The sale will contain approximately

60 Registered Cows, Heifers and Bulls

The foundation females in this herd came from some of the best known herds in the United States and Canada, and they have been mated regularly with high class bulls.

The cows are mostly all young, regular breeders, and the entire offering is in good physical condition. Every animal is guaranteed to be a breeder and is tuberculin tested.

Whether your need is for registered Ayrshire cows, bred or open heifers, or a good bull, you should find something to suit in this offering.

Catalog free on request.

America's Pioneer Dog Medicines

BOOK ON
DOG DISEASES
And How to Feed
Mailed free to any address by the Author
H. CLAY GLOVER CO., Inc.,
118 West 31st Street, New York

To keep thoroughly posted subscribers should read every advertisement in the California Cultivator columns.

head and includes an extra choice lot of young things out of highly bred cows and by their great herd sires King of the Black and Whites, King Pontiac Segis Inka, and King Lillian Walker Segis. To feed this large herd additional acreage on the ranch has been seeded to alfalfa, and the crop this year will run up around 1200 tons, sufficient to take care of the hay problem for the herd. A good crop of corn will go into the big silos on the place, and this in connection with the crops of barley and oats will make up a very large part of the ration necessary to successfully handle the herd. Official testing is just now about to begin for the season and Superintendent George Wendt has many very promising candidates under his care.

Bonita Stock Farm, Lodi, the property of J. M. Henderson, Sacramento, is one of the high class breeding farms of the state. It is an excellent property, considered as farm land, and is well improved with barns and other buildings. The herd of registered Holsteins on the place now numbers 160 head, and the young cows in the herd justly rank among the choice ones of the West in both type and production. The herd is headed by the richly bred bull Supreme Glista Pietje, who is also an individual of marked excellence. Manager Verne Heath will continue the program of official testing in the herd, and the herd promises to be a source of news when the season's official testing begins soon.

Marsh and McCracken, who hold a joint sale of Poland-Chinas in Modesto, October 4 state that if breeding and individuality are the accepted standards they have no fear as to the outcome of their sale. With the blood of King's Big Bone Leader, grand champion of 1918, and an accepted leader as a sire of big type Poland-Chinas, together with Major Hadley Wonder, grand champion in 1917 and the sire of champions, predominating in this sale, there is no reason why this sale should not prove attractive to the breeders on the Pacific Coast. Fifty bred sows and gilts will be sold.

The San Joaquin Poland-China Breeders' Association which will hold its first sale in Lodi September 19 believes it is offering the farmers a real opportunity as well as a great saving of time by selling at this time a number of good boars just coming to proper age for service. Heretofore it has been necessary when buyers wanted a young boar to visit the herds of the various breeders to make their selections. The association has selected these boars for the convenience of these buyers as they can come to one place and secure just what they want. In addition to the boars to be sold a number of good sows and gilts bred to the good boars in the herds of the members will be offered.

A special attraction in the sale of Dimmick Bros. and C. G. DeRaad, which will be held in Hanford September 30, is a high class daughter of The Yankee which was purchased from Williams Bros., Villisca, Iowa, last winter. This sow farrowed nine pigs by King Giant, four of which will be in this sale, the others having already been sold. Dimmick Bros. state that this sow has wonderful individual merit and being by The Yankee should prove especially attractive to breeders desirous of adding this blood to their herds. This sale will be a complete dispersal of the entire herds of C. G. DeRaad and Dimmick Bros. and offers a great opportunity for those interested in Poland-China swine.

In the coming banner sale of bred Poland-China sows and gilts to be held in Hanford by John M. Bernstein and W. L. Haag and Son September 17 the two boars to which they will be bred are creating quite a stir in swine circles due to the prominence of their sires. In the herd of John Bernstein is The Yankee Jr. a son of Williams Bros.' boar, The Yankee, whose get have been so much in demand of late, a senior pig selling last month for $3500 and several spring pigs selling all the way from $500 to $1200. In the Haag herd is found a son of Liberty Bond. In a recent sale, sows bred to this boar made the average of $650. Practically all the animals in this sale will be bred to these two boars and as the sows carry the blood of some of the most popular sires, this sale offers unusual opportunities for the introduction of this new blood.

H. S. KING HERD TO BE SOLD

Southern California dairymen will be very much surprised to learn that H. S. King of Long Beach is disposing of his entire herd on September 12. This herd was founded about 16 years ago, and up to the present time nothing but the best of pure bred sires have been used. The dams of the present herd are principally daughters of two royally bred sires obtained by the Bixby Land Company from the famous A. W. Morris & Sons herd of world record yearly production cows at Woodland. When these cows were sold at auction on April 15 this year they made one of the highest sale averages ever made in California, proving conclusively that using the best that could be purchased in pure bred sires was appreciated by the intelligent dairyman.

The present herd is practically 31-32nds pure bred, being sired by pure bred sires and out of the above mentioned cows. Undoubtedly this is the best herd of young grade Holsteins ever offered at public sale on the Coast, and the only reason that it is being sold is the fact that the portion of the Bixby Ranch on which the dairy farm is located is being subdivided. The sale will be conducted by Col. Ben A. Rhoades and Harold B. Rhoades of the firm of Rhoades & Rhoades.

SOUTHERN CALIFORNIA DAIRYMEN'S DAY

Farm bureaus of Southern California, under the leadership of Robert W. Hodgson of Los Angeles County, are planning for the observation of Dairymen's Day in connection with the Los Angeles Live Stock Show. One day during the show has been set aside, that of Thursday, October 23, as Farm Bureau Dairymen's Day. Adviser Hodgson writes:

"There will be a morning program in the auditorium of the state exposition building, and in the afternooon Mr. Scribner will conduct a dairy cow judging demonstration on the show grounds. Our program for the morning session has not been definitely arranged as yet but it is expected that we will have B. H. Rawl, chief of the dairy division at Washington, for one of the speakers. We are assured of S. H. Greene of the state dairy council as another and expect G. M. Brown of the Burr Creamery to speak for our cow testing members. G. E. Gordon, assistant farm adviser, will speak on feeding rations of dairy cows. We have been assured of the cooperation of practically all dairymen's organizations in this part of the state and expect to have one of the largest gatherings of dairymen ever held in this part of the state."

SPECIAL TO NATIONAL DAIRY SHOW

President H. E. Van Norman of the National Dairy Show is anxious that a large number of Californians shall make up a special car for this great exhibit of dairy appliances and dairy products to be held in Chicago in October. Arrangements have been made to attach this car to the Overland Limited leaving Oakland Pier Thursday morning, October 2. Sam H. Greene, secretary and manager of the California Dairy Council, is working with President Van Norman in this effort to secure a great representation of Pacific Coast dairymen. Mr. Greene writes:

"This year the federal government has joined with the management to make it the biggest and most instructive show that has yet been held. Doubtless a larger number than ever before will go to Chicago for the week October 6-12. Heretofore they have gone by ones and twos on different days and different trains, to be lost as Californians in the great crowds that attend the show. Now the vice director of our college of agriculture and dean of the university farm school is the president of the National Dairy Show. Californians ought to have pride in that fact and do something to show it.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

HEREFORD BUSINESS BOOMING

John A. Bunting, secretary of the Pacific Coast Hereford Breeders' Association, says that the interest in Herefords is showing a marked increase and predicts that during the next year many new herds will be established. "Since the 1918 state fair there has been a number of new herds established and all the older herds have been greatly strengthened," Mr. Bunting stated, and added. "The demand for breeding stock is developing so fast that breeders are finding it difficult to keep their herds intact. During the past year a good many California Herefords have been taken by buyers from the Hawaiian Islands, and apparently the only reason more did not find their way to new homes in the Pacific Islands was due to the fact that they simply could not be obtained. Buyers who were here in the spring and went home short are back again and making substantial purchases. During the past two weeks a buyer from one of the Hawaiian Islands visited breeders in this state and selected the largest shipment yet made, and included in the lot was a yearling Bonnie Brae bull from the herd of W. J. Bemmerly, Woodland, that represents the highest price ever paid for a California raised Hereford at either public or private sale.

"Since the first of the year a number of very high class bulls have been added to herds owned by members of this association. The Caziers in Nevada selected the sensational young bull Beau Bianchard 76th from the Engle herd in Missouri at the highest price ever paid for a Hereford bull in either Nevada or California. The price paid was $10,000. The bringing of such a bull to this Western country is certain to have a far reaching effect on the business. Another notable addition to the Pacific Coast Herefords was the purchase by H. H. Gable of Esparto of the crack bull Don Perfect 4th, a son of the International champion, Point Comfort 14th.

"That this section is attracting considerable attention from breeders in other sections is indicated by the recent transfer of the good herd owned by William Briggs of Texas to a ranch he has just purchased near Dixon.

"The local demand for Hereford bulls is far in excess of the supply and it will require many more herds before the demand can be handled. There is no reason why this state should not be producing all the bulls needed for range work as it is certain that California cattlemen would much prefer to buy their bulls at home. With such a keen demand at home and our established trade with the Islands taking all we can spare it looks as though the breeding of Herefords presents about the most attractive business proposition to be found in this state.

"The Pacific Coast Hereford Breeders' Association is lending every encouragement to new men entering the business, and through our association sales we offer means of selling that are proving highly satisfactory."

GLENN COUNTY BREEDERS PLAN BIG SALE CIRCUIT

If plans now being considered by Glenn County breeders materialize the second week of August, 1920 will see staged one of the biggest live stock events ever held in the West. The plan contemplates holding a circuit of pure bred auction sales in which all breeds represented in the county will be sold. Glenn County claims the honor of having more pure bred Berkshires and Duroc-Jerseys, more individual owners of registered Shorthorns than any Western county. Glenn County is also noted as a Jersey center. It is thought that at least enough sales can be arranged to occupy a full week.

W. C. Swett reports the sale of 47 four months old registered Duroc pigs to Mrs. Ross E. Whitley of Van Nuys, Los Angeles County; also 17 head of bred registered Duroc sows. The pigs are by Grand Golden Model, Model Defender 1st, and J. T. Cherry King Orion.

Worth Investigating

Our recent purchases of some of the best bred Duroc-Jerseys from the leading eastern herds enable us to offer animals of true Duroc type, quality and breeding. When you think of Duroc-Jerseys, think of

The Key Herd of the Pacific Coast

Just now we have a few sows and gilts, bred to an outstanding boar that will afford you a profitable investment at the price we are asking. Young pigs of both sexes. A few service boars. We will be pleased to send you full particulars,

H. P. Slocum and Son
Willows, California

WHAT DO YOU WANT?

We have some choice young Duroc boars and gilts. We are making a reasonable price. Foundation animals of choicest breeding.

Of Interest to Sheepmen

The following discussion of classes and grades of western wool by the field animal husbandman of the Idaho agricultural extension service is of interest to wool growers. These points will be discussed with sheepmen by members of the live stock squad, a party of live stock experts and students being sent over the state by the agricultural extension service of the University of Arizona, for a series of meetings and demonstrations with sheep and other live stock men.

"Generally speaking, there are two classes of wool, staple and clothing. To these a third, or braid, is sometimes added.

"The classification into staple and clothing is on the basis of length. Staple goods are two and one-half inches or more in length. Clothing wools are shorter. Braid is a term given to long wools such as Lincolns and Cotswolds. Sometimes this is called luster wool. Staple wool is sometimes called clothing wool.

"The grades of wool are made on the basis of fineness. Usually the finer the wool the better the price per scoured pound. However, because of the low shrinking qualities, the coarser wools may sometimes sell for a higher price in the grease than the finer. The grades that apply to this country are fine, half blood, three-eighths blood, one-fourth blood, and braid.

"Wool of the different grades comes from the folowing: Fine and fine medium, Merino and Rambouiliet; half blood, crossbreds; three-eighths blood, Shropshire, Hampshire, Corriedales, crossbred; quarter blood, Shropshires, Hampshire, Oxford and crossbreds. (Sometimes low quarter blood from the long wools); braid, Lincoln and Cotswold.

"Because the grades shade into each other this list is not entirely complete. For instance, there are fine medium, high three-eighths, low three-eighths high one-quarter, etc.

"Many of the published prices are on the scoured prices while we deal here only with the wool in the grease. The local price will depend upon several factors, the chief of which is the amount of yolk (grease), suint (perspiration) and dirt.

"One other point must be considered in determining the value of wool clips. Some of the wool is poorly grown, from inferior and poorly bred sheep, or from sheep that have received poor care. Again it may have been well grown but allowed to become full of chaff, sand or burrs, or been poorly sacked with the tags and sweepings mixed through the sack and the fleece of black sheep, bucks and ewes of different breeds all mixed. It may have been tied with binder twine. Perhaps it is wet or the sacks have been allowed to lie on damp ground. If so and the wool is sold on its merits or consigned the grower can expect a reduction in proportion to the damage done."

Cattle Confidentials

Ben J. McKinney, practical cattleman of Tucson gives the students who are taking the course in range live stock production at the University of Arizona some worth while advice. Among other things Mr. McKinney says:

"I erect chutes and vaccinate the calves. I was one of the first men to vaccinate in Willcox County. Its efficacy was soon proved and in 1916, I purchased 5000 pills, which was 95 per cent of the pills used north of the railroad track where are found as fine range cattle as are raised in Arizona.

"Plenty of salt should be out at all times. Salt is one of the best cowboys I ever employed. It keeps the cattle at home and together, making them gentle and fewer bulls are required.

"The proper handling of cattle will increase the calf crop. By this I mean handling cattle as quietly as possible, bringing them quietly together to brand, to vaccinate, to wean the calves or to gather the steers. They should not be run and roped and unnecessarily excited. In Sulphur Springs Valley, up to within a few years ago, to have the respect of the balance of the boys, a cowboy had to be able to tournament a cow. By this was meant to run up by the cow's side, turn the rope over her back and get both front feet. Then turn your horse off to one side, upsetting the cow so she usually struck on her back. One would run or lope about 10 or 15 miles, making the outside circle about 20 to 30 miles, tournament several cows on the way back, rounding-up from 1000 to 6000 head of cattle. Saddle horses were then changed and the cows and calves were cut out. Next men were sent in to cut the strays, then the calves were branded, averaging about 400 a day. One day we branded 875. That day has passed. More calves would be branded on one of those round-ups than there are cattle in that country today.

"The Wild West day is over. The large ranges are gone. This year quite a number of stock, including yearling steers, were bought on the range by weight, and this method is growing in popularity. The cost of raising cattle is mounting higher and higher. Hence, to be profitable, cattle must have constant and intelligent care. The day of the scrub cow is passing. The demand is for a high standard and we must furnish the supply. It is not a question of will we raise good cattle, we must raise good cattle."

Carruthers Sale of Berkshires

The sale of Berkshires held by W. M. Carruthers Saturday, August 23, on the farm near Live Oak, was well attended and was conspicuous by the attendance and support given it by the breeders of the state. While the sale was principally of young boars and gilts that will be old enough to breed this fall for spring litters, a number of carefully selected sows and two bred boars were included in the offering. The principal attraction centered around the 1918 reserve grand champion boar, Live Oak Champion.

He went to the herd of R. J. Merrill and Son, Morgan Hill, for $425, the price being hardly in keeping with his breeding and individuality. The top sow, Live Oak Belle, was purchased by H. C. Muddox and Son, Sacramento for $285. Other sows in the sale sold as follows:

3—R. J. Merrill & Son, Morgan Hill, $145.

4—H. C. Maddox & Son, Sacramento, $285.

5—Geo. P. Robinson, Sacramento, $155.

6—C. N. Esender, Los Angeles, $110.

8—C. N. Esender, Los Angeles, $1[illegible]

12—Gilt A. B. Humphrey, Escalon $130.

1—Boar, R. J. Merrill & Son Morgan Hill, $425.

2—Boar, Geo. Kounias, Mod[illegible] $155.

Average $188.81.

The young boars and gilts sold [illegible] from $30 to $90, making in every way a very satisfactory sale. Ord L. Leachman, Sacramento, was the auctioneer.

HORSE MEAT FOR HUMAN FOOD

To open up the channels of trade for some of the inferior horses in this country that do not pay for their keep and to increase the meat supply in some of the largest cities in the United States and abroad where horse meat is used for human food, the United States department of agriculture is authorized by congress to inspect horse meat and horse meat products. The amendment to the regulations governing meat inspected by the department was passed by congress on July 24 with an appropriation of

$100,000 to carry on the work during the fiscal year ending June 30, 1920

While it is expected that as a result of this amendment inferior horses throughout the country will be slaughtered for human food, it will open a market especially for the small horses (many of them wild) on the western range. These animals are eating much of the limited supply of range feed which is needed by live stock that is better able to pay for its keep. Elimination of the undesirable horses not only will save feed for more worthy cattle and sheep but will add hides to the leather supply and increase meat stocks.

Every establishment in which horses are slaughtered for the preparation of food products for transportation or sale in interstate or foreign commerce must be federally inspected under the new regulations. All horse meat for export trade must be inspected. The slaughter of horses and the preparation and handling of horse meat must be conducted in establishments separated from those in which other animals are killed and handled. All horse meat or horse meat products must be conspicuously labeled or branded: "horse meat" or "horse meat product," and must bear the statement "U. S. Inspected and Passed by the U. S. Department of Agriculture." The regulations list a number of horse diseases which, if found in any animal slaughtered will cause it to be condemned as food.

CONTRA COSTA COW TESTING

The Contra Costa Cow Testing Association reports for the month of August 20 cows giving over 1200 pounds milk; 11 cows over 50 pounds fat. The best record was made by a pure-bred Holstein owned by Bock Brothers. She gave 2520 pounds milk and 78.12 pounds fat. E. H. Fox of Oakley owned seven of the 20 cows giving over 1200 pounds milk and four of those giving over 50 pounds fat. M. W. Hotchkiss of Knightson had five cows giving over 1200 pounds milk and three cows giving over 50 pounds fat. Durrough Bros. of Oakley had four cows giving over 1200 pounds milk and two cows giving over 50 pounds fat.

A FARMERS' FAIR

As the date for the Southern California Fair at Riverside, October 7 to 11, draws nearer it becomes more evident that the largest fair in the history of that organization wil be held. The premium list, published and circulated this year is more comprehensive than any former one, with new departments and new classes.

The live stock division of this fair promises a very marked increase in each department. The pen space in both the cattle and the swine departments is being considerably more than doubled, and more is asked for. The dairy breeds will be especially well represented, responding to the large increase in pure bred dairy stock in Southern California. The swine department is stepping far ahead of any previous record and will show full classes in the leading breeds.

The goat show promises to be the largest ever held in the United States. The building, just completed, provides room for 300 animals. The apiary men claim they will make the greatest honey and general apiary display at Riverside this fall ever gathered together for show purposes.

The poultry show has always been a leading feature of the Southern California Fair and this year's display will in many particulars exceed any previous show. Rabbits have been given a special department and will have many times the entries ever before shown in this fair.

Every year there has been some great racing and Riverside has the reputation of having the fastest track in this part of the state. This year a very attractive race program has been arranged and some good racing is promised.

Another new feature for this fair is the auction sale of pure bred stock which will be held Friday and Saturday, October 10 and 11. Col. W. C. Lookingbill will be manager of this sale. A large entry list of fine stock is assured from the number that has already come in, and a great sale will undoubtedly take place.

A wool pool under which sheep raisers would cooperate at shearing time was proposed by John H. Guill, Jr., of Chico, at a meeting of the Butte County farm bureau held in Oroville. A great amount of expense would be saved and added profit accrue to the raiser, he said.

Combination Sale

65 Registered Holstein Cows Heifers and Bulls

Consigned by

Henderson Company, Sacramento, Cal.

Bonita Stock Farm, Lodi, Cal.

Stockon, California

Thursday, September, 18, 1919

The offering will contain a richly bred lot of females, many with A. R. O. records and out of A. R. O. dams, and, with the exception of a very few unbred heifers, every female is either fresh or well along with calf.

These good cows and heifers are bred to King of the Black and Whites, who has more A. R. O. daughters than any other bull on the Pacific Coast; King Pontiac Segis Inka, son of King of the Pontiacs; King Lillian Walker Segis, son of King of the Black and Whites; Supreme Glista Pietje, a 32-lb. sire, and others of sound breeding.

BULLS IN THE SALE

The offering will include a number of richly bred young bulls, some ready for service, presenting one of the most desirable selections of the season for the breeder or dairyman wanting a herd bull.

Every animal guaranteed to be a breeder

No animal in sale tuberculin tested

Sale will be held at DARBY'S BARN, corner East Jefferson and Pilgrim Streets, Stockton, California, where cattle will be on exhibition two days prior to sale. Some and see them before sale.

Catalog free on request to management.

Breeders Are Offered a Wonderful Opportunity in the W. L. Haag & Son and John M. Bernstein Banner Sale of Big Type Poland Chinas

TO BE HELD IN

...HANFORD, CALIF., WEDNESDAY, SEPTEMBER 17, 1919...

THE YANKEE, JR.
Son of the World's Famous Boar, The Yankee

These two boars, mated with the sensational lot of big type sows and gilts, affords the purchaser the opportunity of not only adding to his herd the most popular Poland-China blood of the present time but from the litter he can select and develop his own herd boar whose breeding will command the respect of the entire Poland-China fraternity.

LENDORRIS LIBERTY BOND
Son of Glover's Marvel Liberty Bond

Where, and at your own price, can you buy as high class Poland-Chinas as are offered in this sale? They have been selected from the herds of such well known breeders as John Bernstein, W. L. Haag and Son, Wm. Bernstein, E. D. Frazier, Thos. M. Hunter and Sons, J. A. Gerlaugh, and sired by such boars as Frazier's Timm 2nd, President, Giant Jones, Young Jumbo, K's Big Price 2nd, Miller's Long Chief and King's Big Bone Leader.

Can anyone doubt but what this offering will attract a flood of discriminating buyers who realize this is their real opportunity for securing animals of such rare breeding and individuality, such, that never before have been offered at public sale in California.

Why Buy Unsalable Blood? Buy what is demanded. Don't let it be a matter of cost or price—Get what you want—What you need—Get it at this sale.

Messrs. Haag and Bernstein extend a cordial invitation to every lover of good swine to attend this sale and be their guests.

Lunch will be served at 11:30 A. M. Sale will start promptly at 12:30 P. M.

H. M. BERNSTEIN, Hanford, Auctioneer

Everything in sale double immunized. Write for catalogue to either

W. L. HAAG & SON, or JOHN M. BERNSTEIN, Hanford

On Wednesday, Sept. 17th, all roads will lead to Hanford, Calif.

REMEMBER THE DATES AND BE SURE TO BE THERE

HANDLING AND CONDITIONING SHOW CATTLE

By Alex. McDonald, University Farm

Editor's Note: The following article was prepared by Alex McDonald who is in charge of the beef cattle at the University Farm. McDonald is regarded as one of the most expert feeders and fitters in the world and has to his credit the grand champion and reserve grand champion steers at the 1916 International and many other famous winnings. His advice is sought and appreciated by all.

I am asked to write an article on "letting down," or carrying highly fitted show cattle from one year to another and still retaining the bloom and smoothness so desirable in high class show animals.

After viewing the splendid specimens that are exhibited year after years at the state and other fairs one would almost think that any information in this connection would be uncalled for. However, for the benefit of those who plan to fit and show a few cattle and have had no former experience in handling them a few suggestions along this line may prove of interest.

The mild California winters where green grass is usually available simplifies the problem of carrying show cattle and furnishes a striking contrast as compared with climatic conditions in the Eastern states. In my opinion plenty of green feed and abundant exercise are the two most important factors in cooling out and conditioning a show herd for next season's fitting.

When the last show of the season is over and the cattle retired to their winter quarters, the grain ration may be gradually reduced, eliminating the noon feed, turning the cattle on pasture during the day and feeding grain morning and evening. After a short time, in the case of mature females, the grain ration may be reduced to once daily, and in some instances when an animal has a tendency to stay fat under almost any conditions if the pasture is fairly good, the grain ration may be dispensed with entirely for a time.

With the younger animals I prefer to feed grain twice daily during the winter months, the amount, of course, to be determined by the condition of the animal, and where a very prospective candidate for next year's showing is in evidence, a nurse cow furnished morning and evening would be a decided advantage.

I have always found a grain ration composed of rolled or ground barley, oats and wheat bran, equal parts by bulk, to give good satisfaction. A few beets may be fed to good advantage, but where green grass is available it is not so important that beets be fed. The importance of exercise will, of course, apply to the younger cattle also, and care must be taken that the animals do not become infested with lice, for a lousy animal presents an unthrifty appearance no matter how well cared for otherwise.

It will also be well to give close attention to the young calves, and when a good prospect appears see that a little extra milk is furnished. Do not attempt to crowd too much with milk at first, as the digestive organs of a young calf are easily overtaxed, causing stomach trouble, and sometimes a chronic bloater will be the result.

The nurse cow will usually care for two calves nicely until they are from four to six months old. At this age one calf will usually be able to take the milk from the average nurse cow.

A CRACK SHORTHORN SALE

One of the attractions of the fall season will be the sale of 45 head of high class Shorthorns for the Roselawn herd at Woodland, of which Henry M. Elberg is proprietor. The Roselawn herd is one of the oldest herds in the state, having been established something like 30 years ago by W. B. Gibson, father of the late T. B. Gibson. The herd has always enjoyed a high reputation and has been the source of many of the best cattle produced in this state. The approaching sale is made necessary by a rearrangement of the leases controlled by the Gibson Estate, whereby Mr. Elberg surrenders part of the land he is now operating. This reduction in acreage necessitates a substantial reduction of the herd to a point that will permit it fitting into the contemplated plans.

The sale promises to afford a rare opportunity for breeders and beginners to select breeding material that would probably never be offered for sale were the herd maintained at its present proportions. One of the chief attractions will be the three year old herd bull Crescent Dale, a splendid red son of Whitehall Rosedale by Avondale. His dam is a daughter of Ruberta's Goods and out of an imported cow. This bull is one of the really good bulls to sell in the West this year. He is a bull of size with a remarkably smooth covering of thick flesh. Calves by him are of a quality to suggest that he can be rated as a valuable sire. Several extreme top females will sell, including the good cow Mischief E 3d, grand champion at the 1918 state fair and dam of the Roselawn herd bull, Roselawn Champion, junior champion at the 1918 state fair. The sale will be managed by the California Breeders' Sales & Pedigree Company, Sacramento.

HIGHLY ESTEEMED POLAND BREEDING

Recent Eastern sales of Poland-Chinas tend to forecast the high value placed upon certain blood lines and individual sires. By the recent sale of Mabel's Jumbo at $18,000 by Halford and Hassler a new record price for a Poland-China boar was established. Mabel's Jumbo was sired by Long Jumbo, who also sired Jumbo Bob, the sire of W. L. Haag and Son's senior herd boar Young Jumbo. Like his illustrious grandsire, Young Jumbo is also siring sale toppers, as open gilts by him were the highest priced open gilts sold in the last two Poland-China sales held in Hanford. In the Haag herd will be found a large number of his daughters, some of which will be included in the sale to be held in Hanford September 17 by the Haags and John Bernstein. Haag and Son consider themselves very fortunate in having in their herd two such splendid boars as Young Jumbo and Lendorris Liberty Bond, representing the blood lines now being sought by many of the foremost breeders of Poland-Chinas. Sows and gilts bred to both Young Jumbo and Lendorris Liberty Bond will be included in the sale, and the breeders on the Pacific Coast will, therefore, have the opportunity of adding this blood to their herds.

A big live stock meeting was held at the Chaffey Union School farm on August 20. F. H. Scribner, dairy expert of the Los Angeles County farm bureau, and Prof. J. I. Thompson of the state university, gave addresses.

Culling for Egg Production

By Jean A. Koethen

THERE has never been a time in the history of the poultry industry when the thoughts of poultrymeu turned so persistently to the elimination of the unfit. It seems from published statistics of one sort and another that the non-producer is the one great stumbling block to the industry. If every hen in every flock could be counted on to lay even ten dozen eggs in a year, there could be no question of profit in a properly managed business. That there are many hens in commercial as well as farm flocks that never come up to this record is beyond question. War necessity forced us to find methods of picking out the high and low producers. There is no longer room for the latter. They must be detected and removed.

The whole matter of culling naturally falls under three heads: the culling of pullets that have not yet laid, the culling of pullets that have laid but a short time, and the culling of hens that have laid six months or longer. In culling pullets that have not yet laid we look first of all for vigor, and second for capacity.

Vigor

No pullet can stand up under present day requirements that does not possess what is known as constitutional vigor or inherent vitality. Such a bird will have a full, bright eye, an alert air, and usually a short well curved beak, short legs and short toenails. A vigorous pullet grows and matures more rapidly than one lacking in vigor. She is usually the first to begin laying in the fall, hence the birds that lay earliest may safely be banded as probably those that will always be prolific layers.

Capacity

When we speak of capacity we mean the size of the abdominal cavity. Outward and obvious signs of capacity are the long back and deep keel which have always been considered characteristic of the egg type. A hen that is to manufacture many eggs must have room in which to make them. The Hogan system of picking layers is based entirely on capacity and is essentially a test of type, for, other things being equal, a pullet with long back and deep keel will be characterized also by a considerable space between the pelvic bones and the end of the keel. This distance has been found to range from three-fourths of an inch to as much as five inches. In pullets that have not commenced to lay it should be large enough to permit the insertion of at least two fingers, and some experts say three. Others believe the length between keel and pelvic bone is not itself a reliable test but must be considered along with the cheracter of the pelvic bones. If these are straight and thin the hen is a promising layer; if they are thick and bent in toward the center she is not so promising.

Performance Vital Test

Having selected the pullets that have vigor and capacity, our next step in culling is to watch them for two or three months. Here a trapnest is almost essential. If that is out of the question, as it is on most poultry plants, the next best thing is the keeping of a pen record. "If a pullet does not lay 20 eggs a month after she is once fairly started, I don't want her," said a successful poultryman to me not long ago. A little leeway must be given the pullet that is beginning, but after the first month she should lay 20 eggs each month. If the pen record shows a lower average than this it is time for the poultryman to ask the reason. Comparison of the pullets in the pen with respect to type, comb, and general alertness and vitality will usually result in the detection of the low producer right at the beginning of her career. Examination of the pelvic bones may also be a sufficient test, for the oftener a pullet lays, the wider apart and the more elastic are these "lay" bones, as they are sometimes called.

Culling by Color

From May to September we may cull the flock that has been laying since October or November of the year before by the color of shanks, earlobes, vent and beak. This is a test that is usually applied several times and is not considered final unless corroborated by the Hogan test.

"We cull by the color test entirely," said the proprietor of a 4000-hen ranch in answer to my query, "but the Hogan test always backs it up." On this ranch the hens are culled in May, June, July and August, each culling removing the hens that have stopped laying and are beginning to molt. The culling might be deferred till the molt is completed, but the owner thinks he is saving money by eliminating the early molters at the beginning instead of at the end of the molting period.

The theory of the color test is simply this: The body of the bird contains quite a large amount of yellow pigment, which is most easily seen in the shanks of yellow-legged birds, about the vent and in earlobes and beaks. When a hen is laying this yellow pigment is absorbed and put into the yolk of the eggs she lays. As the body does not contain pigment enough for all purposes the yellow parts of the body fade as more and more eggs are produced. A pullet that has laid steadily since November will in May show pale shanks, earlobes, beak and vent. Especially about the vent is the change in color noticed. Color fades out first here, as production continues, and returns soonest after production ceases.

When a flock is culled in May by the color test, the birds that have either not been satisfactory producers during the winter or have already begun to let up in their laying preparatory to the molt may be easily recognized by their yellow shanks, etc., while those that are still laying

(Continued on Page 319.)

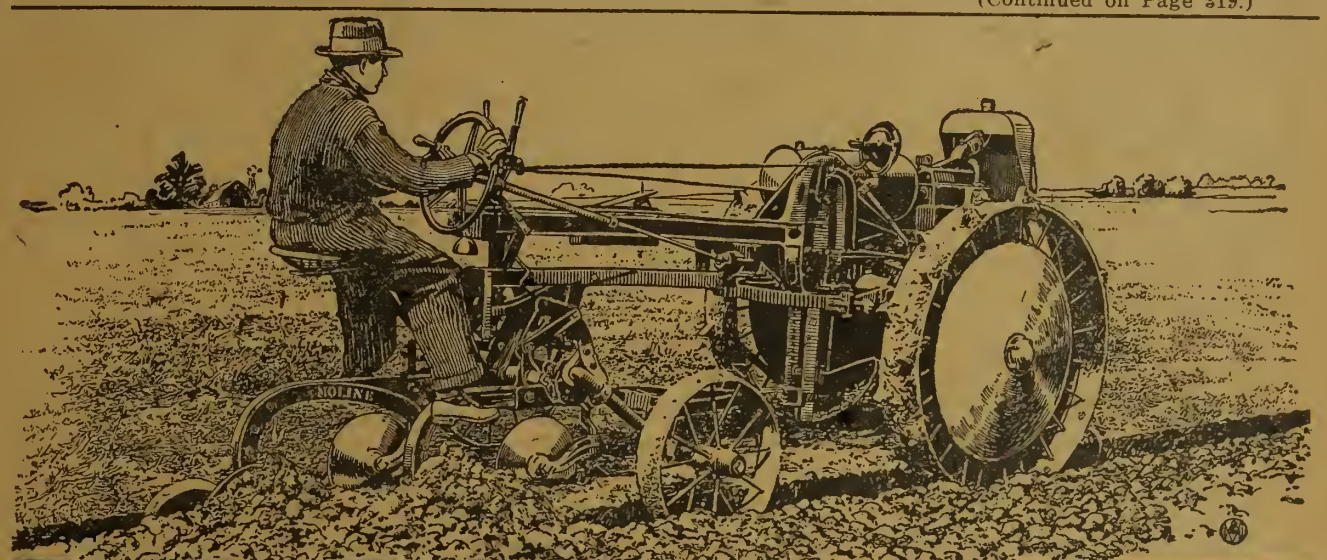
POULTRYMAN'S CALENDAR—SEPTEMBER, THE CULLING MONTH

Culling does not begin in September, but it should be finished by that time. Many poultrymen begin to pick out the low producers in May and continue at regular intervals until September. Others cull less regularly but make a general round-up by the middle of September.

On many poultry farms the pullets are Hoganized in September, those which pass the test being put in the laying houses and the others being sent to market or segregated for further testiug.

In September the hens that have laid off to molt show it very plainly by their yellow legs and earlobes and their deeply colored beaks and vents. Those that have not molted are ragged in feather and pale in shank and vent. It is these late molters that are recognized as the heavy layers.

Only probable or tested producers should be left in the houses after September. Every early molter, every sickly or lazy bird, every backward pullet should be culled out. Success with poultry is largely a question of careful and remorseless culling.



MOLINE
System of Power Farming

You buy a tractor to make money. The more money a tractor or implement will make for you the more you are willing to pay for it.

Consider then what a tractor will make for you in dollars and cents—how much man power it saves, how many horses it displaces, and the more and better work it will do. That is the way to buy a tractor—the purchase price alone should not influence you.

When you buy a Moline-Universal Tractor you get one of the finest power plants on wheels. You get a completely equipped tractor, with self starter, electric governor, electric lights, belt pulley, power lift gang plow—everything you need.

The Moline Line of Implements
Plows (steel and chilled)
Harrows
Planters
Cultivators
Grain Drills
Lime Sowers
Mowers
Hay Rakes
Hay Loaders
Hay Stackers
Grain Binders
Corn Binders
Pitless Scales
Spreaders
Wagons
Moline-Universal Tractors
Stephens Salient Six Automobiles

You not only buy a quality tractor, but a complete system of power farming. The Moline-Universal enables you to do all farm work including cultivating. One man operates both tractor and implement from the seat of the implement.

Actual figures from over 200 farms in 37 states show that the Moline System of Power farming saves an average of 1⅓ men and 5 horses per farm.

Figure what such a saving will mean to you. Considered from this point of view the Moline-Universal is the lowest priced tractor made. Thousands of farmers are proving this every day. Write us today for full information. It's free on request.

CATTLE

AUCTION

150—HEAD OF HOLSTEINS—150

2—PURE BRED HOLSTEIN BULLS—2

At the H. S. King Dairy, 5 miles south of Compton and 5 miles north of LONG BEACH

FRIDAY, SEPTEMBER 12th at 10 a. m.

When we tell you that this is undoubtedly the best bred herd of grade Holsteins ever offered at public auction on the Pacific Coast, you will realize that they must be pretty good. The dams of this herd were the results of the use of pure bred Holstein sires for 15 years and the herd that is to be sold on the 12th is practically 31-32nds pure bred.

This stock has excellent type, nicely marked, growthy, in fact cannot be duplicated. The offering will include 40 head of heifers milking with their first calf. Included in this lot are some exceptionally heavy producers. 88 head of heifers from 20 to 24 months old, all heavy in calf and include a large number of heavy springers. 22 yearling heifers.

For full information in regard to this sale write auctioneers.

For Sale—Lauson tractor, Deering harvester thresher, Moline 3-14 in. tractor plow, John Deere double disc. Used one season. A-1 condition. C. L. Thornton, R. 1, Box 30, Tulare, California.

SHEEP

Sheep for Sale—Young Merino and Rambouillet ewes; North California stock. Apply, write or wire ANDREW H. McINNES, wool and sheep broker, 408 Bank of Italy Bldg., 550 Mont. St., San Francisco.

For Sale—225 unshorn merino ewes—old but in good fair order. Address: James G. Mee, St. Helena, California. Phone 60 F 1-1.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLUETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

FERTILIZER

For Sale—Chicken manure in carloads. Cheapest and best fertilizer. MacDonald Sons. Phone 101, Watsonville.

PIGEONS

Paradise Strain of White King Pigeons. Young mated birds $2.00 a pair; old mated birds $3.00 a pair. Paradise Valley Poultry Ranch, National City, California.

AUTOMOBILE SCHOOLS

Pacific Auto and Engineering School offers a practical course in auto and tractor tuition; day and night classes. 337 Golden Gate Avenue, San Francisco. Phone Market 1799.

DOGS

Police Dogs (Alsatian Sheepdogs) the most dauntless guardians of life and property in the world. Smarter than Airedales, quicker than Collies. Appearance of wolf. Keen hunters, death on coyotes, rabbits, and robbers. The coming work-dog of America as for years in Europe. Big money in breeding for growing demand. Registered puppies from thoroughbred imported stock for sale at $100.00 each. H. R. Wilson, 1261 Victoria Avenue, Los Angeles.

CULLING FOR EGG PRODUCTION

Continued from Page 317.

heavily will show it by their lack of color. The June, July and August tests merely take the early molters. The hen that is still laying heavily in August has a pale, ragged look. She is not one of these flightly females that are always thinking about their looks, not she. By September the early molters are already in their glossy feathers and bright yellow shanks. They began to rest too soon and may well be eliminated. Examination of the abdomen and pelvic bones will almost always reveal that these hens are not laying and have not been laying for some time.

Watch the Count

One of the best tests of a hen's present performance is her comb. When the comb is bright and red and fully developed the hen is unquestionably laying. When the comb is small, pale and dried up, production has ceased. If such a comb is noticed in the spring, when all hens should be laying heavily, she may as well be removed from the flock. If such hens are put by themselves for a short time their value can soon be determined. If extra feeding does not change the appearance of their combs they may be classed among the slackers and sent to the butcher.

No one of the above tests can be absolutely relied on by itself, but the application of all together will soon bring up the production of the most unpromising flock.

LIVE STOCK ASSOCIATIONS MEET FAIR WEEK

A number of live stock associations held meetings at Sacramento during the week of the state fair. The California Shorthorn Breeders' Association met and dined at the Travelers' Hotel the evening of September 1. The Pacific Coast Hereford Breeders' Association and the California Holstein-Friesian Association claimed the following evening for their meetings and banquets held at the same hotel. Other associations held meetings during the week.

TEHAMA COUNTY FARM BUREAU MEETINGS

The regular meetings of the Tehama County farm bureau will be held as follows during the month of September: Antelope, 9; Dairyville, 10; Oak Park, 12; Richfield, 15; Corning, 17; Bend, 19; Los Molinos, 22; Proberta, 24. Directors meeting in Red Bluff on September 19 at 1:30 p. m. All other meetings at 8:30 p. m.

The annual meeting and picnic will be held on September 27. This will be an all day meeting. The business meeting and election of officers will be called for 10:30 a. m. Everyone is cordially invited to attend the annual meeting. Bring your picnic lunch and stay all day.

SAVING MAN LABOR IN SUGAR BEET FIELDS

Farmers Bulletin 1042 of the United States department of agriculture, Washington, D. C., discusses the saving of man labor in sugar beet culture. It discusses the question from every standpoint of culture, harvesting and delivering. It will be sent to every sugar beet grower who writes to Washington requesting it.

4 to 18 tons
of green corn silage
per hour, day after day

The one-silo farmer and the big custom operator who handles the work for a whole neighborhood, both find the solution of silo-filling problems in the

TRADE MARK MONEY MAKER REG U.S. PAT OFF

Safe SILAGE CUTTER and SILO FILLER

Money-Making Features of the Money-Maker

- Automatic Safety Yoke
- Cushion Drive
- Auxiliary Feed Rolls and Springless Force Feed
- Straight, easily sharpened knives
- Quick alignment and adjustment of knives
- Cutting and blowing all done by one solid, semi-steel disc
- Fewer parts
- Sturdiest construction
- Easiest operation
- Light draft

QUALITY

The MONEY-MAKER cuts the silage into fine uniform prices that pack down even and tight with no room for air; it means GREATER SILO-CAPACITY and LESS SPOILED SILAGE.

CAPACITY

The MONEY-MAKER throws fast and far. You can put 4 to 18 tons of green corn silage per hour into the tallest silo. There are sizes from 4 h. p. up.

SAFETY

The safety features of the MONEY-MAKER are invaluable. The AUTOMATIC SAFETY YOKE stops and reverses the feed the instant that the operator's hands get too close to the feed rolls. The CUSHION DRIVE takes up all shocks, jars and unusual strains and saves repair and replacement bills, and means UNINTERRUPTED service.

CATALOGUE FREE

There's a big catalogue and other illustrated printed matter to tell you about this great MONEY-MAKER, Safe Silage Cutter and Silo Filler. Before you invest, write for them. Address Dept. C.,

"DE BIGGES' PILE"

I

"Heah Yo' Washin'ton Lincum Lee,
what kin' of boy yo' gittin ter be?"
Stan'in thar, lik' yo's nofin ter do but
watch 'at woodpile front ob you.
Spec' dem logs is gwine ter say—"We's
goin' ter split oursel's terday, jus'
run erlong, ll'l boy, an' play."

II

"Oh! 'Yer has done a lot, but it seems
as tho' de res' keeps pilin' mo' an'
mo',
An' yer reckon, ef dey gwine that a'way
ter ac', yo'll neber hab de time ter
play.'
"Sho, 'at's kase mos'ly all de while, yo'
jus' keep watchin' de wrong heap,
chile. Turn 'roun', an' look at de
'is done' pile.

III

"Ain' ah tole yer time 'n' agen, 'at when
yer grows an' gits 'mong men,
Dey aint gwine ter car' what you' 'has
ter do,' but dey'll sho wan' er know,
what's 'been done' by you.
An' de mo' 'ls dones' yer has ter show,
de mo' day's gwine ter respe' yer
so, an' point yer out where'er yo'
go.

IV

"Fo' de man what shirks his wuk ter
fret 'bout his job wha' aint done
yet,
Jus' as sho's yer a foot high, son, is de
feller what neber gits nofin done.
An' nofin done means nofin ter eat, an'
mos'ly holes in yer trouser seat,
an' yer rated 'No 'Count' by all
yo meet.

V

"So—wheneber yo' has a task ter do, jus'
'member what Ah'm tellin' you,
Inodah ter 'complish de 'tings yer should,
yer mus' do lik' yo's shoppin' 'at
wood—
Don' fret 'bout what aint done, chile,
keep pluggin' away an' in a while,
de one whats Done is de 'Bigges'
Pile.'"—Clarence Elmer, in Boys'
Life for September.

THE PERFUME CLERK

By Marianne Grauss, in Youths' Companion

LONG aisles smelling of soap essences; an electric fan running overhead; on the right, a display of umbrellas and gloves; in front of the counters, stout women, thin women, awning-striped skirts and tailored models; behind the counter, girls with fluffy hair and powdered faces, and one girl especially who was called Rosalys — those were the things that Alice Hall saw when she closed her eyes. When she opened them, she saw the growing wheat that was of such vast imoprtance to her country, and muddy water flowing lazily in ditches or spreading over a field. She had just finished irrigating for the day.

The times of the perfume counter seemed long ago, and that girl called Rosalys not herself. When she first went to town, Alice Hall had begun to spell her names "Alys"; then she had taken Rose as a first name, for an aunt she had; and finally, somehow, she was Rosalys.

Only. John Mason had never learned that name. He had refused point-blank to learn it. John was the only real thing it seemed to her now in all that time during which she had worked at the perfume counter. She had been engaged to him all the while. Because she had always hated her life on her uncle's farm she had gone to the city; at the same time John had left his mother's place and had found work in the city, too.

Seated on the doorstep near the pinto beans Alice laid her head wearily against the frame. While they were in town, she and John used to go almost every night to the motion pictures. That seemed strange now; and it seemed stranger still that she had liked it all so much.

Into her life as a perfume clerk who was beginning to save finery for her wedding had dropped a great bomb—the war. At first it sputtered as if it were never going off; and at worst it seemed to make no personal difference to her. Then suddenly it had torn her life to pieces. She was not sorry for that—she had changed so—except that John was gone. Inside the house she heard his mother cough, and she went to take her a drink of water.

"It's swect of you, child, to come and help on the place this summer."

Alice smiled. It was a comfort to be needed. Farm laborers were nowhere to be had. She and John's brother Roscoe—who lived in the gray cottage across the fields—and Roscoe's wife, Mildred, were caring for the crop.

"You've always hated farm work," gratefully resumed John's mother.

"No—really. I like it."

It had never been the work that she hated; it was the loneliness of the country; especially the dark, quiet nights, when there is so much time in which to think and to be afraid. She tried to think how brave John had been; she tried to be brave herself. But she had always been afraid of darkness and of quiet, and of death. She would not tell his mother that she was afraid to think; that might lead her to guess something that she was not to know while her heart was weak from her last attack of rheumatism.

"Dear me!" Alice continued. "I shouldn't want to be selling perfume with the world begging for wheat."

"Did you look in the R. F. D. box today?" John's mother asked.

Alice nodded and went on rapidly: "All the people with boys at the front tell the same story. There'll be no letters for weeks, and then seven or eight will float in on the same mail. You mustn't think because we don't hear—"

Her voice broke; she went out of the room hastily and wandered down to the road, where the zinc mail box was nailed to a tree. There was nothing inside; she had known that there would be nothing. When she put her hand in to feel, a sick sensation came over her—she was remembering that day when had found a franked letter that was not in John's handwriting. It was addressed to his mother, who had been very ill that week, and Alice had opened it. She would never forget the words written in the strange hand:

"Reported by Swiss Red Cross a prisoner in Germany."

First she had given the letter to Mildred; then she had gone back to the house. It was dinner time, but food seemed to choke her—because probably John was hungry.

A month had passed without further word. Then one afternoon Mildred had beckoned Alice to come into her house; Roscoe had opened the mail box that day.

Alice remembered that afternoon clearly. Mildred had closed the door to keep out the children. Then Roscoe had said:

"We have news. It is really good news. John isn't a prisoner any more—he's free."

Alice had guessed at once—she had not needed the line, "Reported dead by Swiss."

Probably they would never learn more than that bare fact.

She turned from the empty mail box tonight and went through the big front yard, under the old trees where she and John used to swing as children. Then she crossed the irrigating ditch and in the deepening dusk wandered at the edge of the wheat She had come in the early spring and had seen the grains of wheat fall into the ground to die—and now, before long they would bring forth fruit. She had seen them leap up from the earth, bright and strong in the sun; but the fields were darkening now. She could hear owls in the trees by the river; overhead the nighthawks still screamed as they chased gnats.

Alice was afraid again. When she was a little girl, her mother had died; and after that Alice had always been afraid. Now, she was afraid of everything, but especially afraid to have John die. Sometimes, when it was dark and the frogs made a noise in the ditch, or the wind blew, she almost resolved to run away back to the lights and the picture shows. She ought not to have to live during the war. She was not fit. The stars frightened her—strange worlds that no one knows about— and those dim fields, across which she could not see.

It was a hot night. A bank of clouds rolled up out of the west. Alice went in and locked up the windows. John's mother had always slept without turning a key; John was like her, not afraid of things that might be in the dark. That night Alice made the house so close that she could not sleep.

She lay awake—she thought—until nearly midnight. Then, suddenly, she sprang up in bed, and her heart thud-

When boiling beef, ham, tongue etc., let them cool in the water in which they were boiled and they will be deliciously moist and sweet.

ded against her breast. She could hear Mrs. Mason breathing. What had sounded to her like a step outside the window must have been the rustling of the cottonwood trees in the wind. But she put on part of her clothes and went into Mrs. Mason's room; she wanted to speak to some one. But John's mother was sleeping so quietly that Alice would not disturb her; she crept back to bed.

A few minutes later she sprang up again. This time it was not the wind she had heard, for the air was now still. Some one was on the porch. She heard the knob turn softly.

She knew what John's mother would done in her place; but Alice could not make herself go to the door and look out through the glass. She lay with her heart pounding at her chest like a workman's hammer. At last she slipped out of bed and, putting on her wrapper and slippers, crept to a window.

The moon was overcast, but through the clouds a dim light relieved the darkness. Alice could see the big lilac bush—and the swing. She could see the porch also, and no one was there. A shudder and a chill shook her body. She did not know what she dreaded—she was wondering what terrible visitor had been on the porch a few minutes before.

After a time she crept back to bed and lay with wide-open eyes, listening. It grew very dark outside. The damp air was like a sponge, muffling everything. Then the wind rose; so she could not be sure whether she heard the wind or soft footfalls going round the house to the side porch. There was a hammock on the side porch, where John used to sleep on hot nights. The hooks and chains creaked; she did not know whether the wind was blowing the hammock, or whether the intruder had brushed it aside, in order to approach the side door.

She thought she would just lie there and wait for morning. For a long time she heard nothing except Mrs. Mason's breathing. The intruder, she thought, had gone away. Finally the fatigue of a hard day of work overcame her resolution, and she fell asleep.

Her dreams were so bad that she soon woke. It was raining hard; there was thunder in the distant mountains and now and then a white burst of light. She knew, although she did not know how she knew, that she and Mrs. Mason were not alone in the house. For a moment she sat up in bed and could not move—the pounding of her heart made her so sick.

At last she slid to the floor, still in her wrapper and the pale blue kid slippers with gold buckles that she used to wear when she was a perfume clerk.

Then in the room over her head she heard such a creaking step as that which probably had roused her from her sleep. She went into Mrs. Mason's room. That time John's mother stirred and asked as if half awake:

"Did John get in?"

"No. This is Alice," replied the girl

Her voice was steady, as if she had not been a coward, as if perhaps she could meet her test. She opened a door into the hall. There was a light in the room at the head of the stairs. When she saw the lamplight filtering through the shadows of the staircase, all her courage went. She unlocked the hall door. Roscoe's cottage was three quarters of a mile away.

But she could not be such a coward as to go—to leave Mrs. Mason alone. She turned back. "Alice," said Mrs. Mason, "John got home, didn't he?"

Alice stationed herself just outside the door leading into the hall. "No," she answered; "you were dreaming."

Then she heard some one coming downstairs.

"No, she isn't dreaming!" said a voice. "She heard me. I was so afraid—her heart, you know—I broke in like a thief when it began to rain. But—"

He forgot the rest of his sentence—forgot everything when he saw Alice at the foot of the stairs. "Al?" he cried. "Al! Why, Al, I telegraphed to your boarding house—why, Al-ice!"

Before Alice had come to herself, his mother called again, and they ran into her room.

He picked his mother up in his arms, as if she had been a baby. Then he laid her back into the chair where she slept because her heart was so weak that she could not lie down. Now and then he patted her shoulder and laughed; and Alice, who stood on the other side of the chair, laughed, too, but wiped her eyes. The Masons were not tearful.

Evidently John had been ill, for his face was as white as a baby's; she guessed it was pneumonia, since he had been sent all the way to the dry air of the Rockies to recuperate. He looked questioningly at Alice over his mother's head; and the girl knew just what he meant: "Have you heard any report about me?"

Alice nodded.

His eyes questioned again: "Has mother?"

Alice shook her head violently: that was to indicate, "No! And don't you dare startle her!"

In his face, white from hardship and the illness that had followed it, some old scars showed. Once, when he was a child, he had caught a bobcat and tried to train it for a circus animal. He had got those scars as he was trying to teach it to stand up on its hind legs. Suddenly Alice burst into laughter. Why had she not known that John would get out of the prison camp? If anyoue escaped, it would be Private Mason, U. S. Engineers!

"What are you laughing about?" His eyes were shining as he asked; but he knew.

"What are you children whispering about?" asked his mother. "John, come round here where I can see you."

"I'm going to tell her about it, Alice; it won't hurt her. Mother doesn't scare worth a cent, you know. Say, mother, I've been a prisoner. It's a fact! Bunk Sackett and I made a break for it and got away; and the little German camp commander felt so bad about it he reported us both 'Died of wounds.' And I've got a furlough. What was the use letting you know I was coming? I didn't know it myself till I started, and I was sure to be here before a letter."

He stopped speaking, abruptly. Outside, hail had burst from the clouds of the night. It thundered on the roof like the shrapnel of the battle field. Alice gave a little gasp of relief that he was out of the shrapnel now. Surely he had done his "bit"; he would not be sent back.

(Continued next week.)

FAIR PRICE FOR SUGAR 11 CENTS

In line with the endeavor to establish reasonable living prices the food administration announces that sugar should not retail for more than 11 cents a pound and that "where it is retailing for more it indicates that either the wholesaler or retailer is making an unreasonable profit."

VENUS, THE EVENING STAR

Beautiful Venus is now glowing in our western sky as the evening star. Every evening she is lower and lower, and by the middle of September will no longer appear above the horizon. After that we must get up early in the morning and look for her in the east where she will appear as our morning star. If we follow the old Greeks and Romans who loved to watch the stars, we will call this planet Phosphorus or Lucifer (the morning star). As evening star it was to them Vesper or Hesperus.

THE GROUND GLASS BOGEY

Now comes the army medical corps and knocks into a cocked hat another of our cherished worries which figured so prominently through war days. W. H. Feldman of the Colorado Agricultural College is authority for the statement that experiments by the army medical corps have disproven the popular belief that ground glass is harmful to the digestive tract.

Glass was ground and sifted to secure varying degrees of fineness and considerable quantities of the material were incorporated in fresh meat, the same being fed to hungry dogs. This was repeated in some instances on a number of days, after which the dogs were killed and the digestive tract examined both with the naked eye and the aid of a microscope, and no injury whatever was perceptible. Before being killed the dogs apparently suffered no inconvenience and appeared normal in every way.

What Do You Know About Pianos?

Assuming that you can "tell a good tone," can you judge the hundred and one things which enter into the making of a Piano, the things which have their part in making and maintaining a good tone? Do you know the differences in plate and scale design? Are you familiar with the various actions? Are you a judge of the wood, the wire, the felt, the veneers and all the other materials which enter into the making of a Piano?

Probably not — not one person in a thousand possesses this expert knowledge. After all, when buying a Piano you depend greatly upon the expertness and the integrity of the dealer or house. Let your greatest care be the selection of the Piano House. Tell that house what you would like and what you can afford and they will guide your selection of a Piano with expert judgment and a sincere desire to serve you well. Beware of a "cheap piano"—in the end it is the most expensive. Avoid the alluring statements of some dealers — they are but pitfalls to catch the unwary. Protect yourself by going to a Piano House with a reputation for integrity and fair dealing—you will never regret it.

We invite you to call at any of our stores — or write us asking for illustrated catalogs and prices.

We are dealers in Steinway and other Pianos, Pianola and Duo Art Pianos, Aeolian Player Pianos, Player Rolls, etc.

Corn: California yellow, 3.65@3.75 cwt., Egyptian 3.40@3.50; Milo maize, 3.20@3.25.

Rye, 3.15@3.30.

Wheat: Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cental
No. 1	2.20	3.66 1-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.

Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00@54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of August 30, Scott, Wagner & Miller says:

Receipts past week 3459 tons. Thu notwithstanding the railroad strike which practically stopped the movement of all cars to this city for a short time, the receipts are somewhat higher than last week, but this is occasioned by the extra receipt of hay by boat from the bay and river districts which has been exceedingly heavy and no doubt will continue that way for some time to come as boats are available. Most of the hay arriving has been red oat from the reclaimed districts and alfalfa from the river districts. Although this hay moved off fairly well, demand has not been as brisk as it was. Third cutting alfalfa is now being marketed from the river and is as a rule of a very fine quality and sells well.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the Hay Market—for prices to consumer, charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay (light 5-wire bales) .....17.50@19.00
No. 1 Wheat or Wheat and Oat Hay .....15.00@18.0
No. 2 Wheat or Wheat and Oat Hay .....12.00@15.00
Choice Tame Oat Hay .....15.00@18.00
Other Tame Oat Hay .....12.00@15.00
Wild Oat Hay .....10.00@14.00
Barley Hay .....12.00@16.0
Alfalfa Hay .....17.00@22.00
Stock Hay .....8.00@12.0
No. 1 Barley Straw, bale.....50@80

Citrus Markets

Los Angeles, September 4, 1919

The railroad strike cut off new shipments and resulted in cleaning up all Valencias on hand in Eastern cities. Especially good prices were received in New York and Boston markets. Growers anticipate higher prices for the new fruit which is now going forward. About 4 cars of Valencias were packed and loaded when the strike began on the electric lines and these were hurried forward on steamlines or stored in pre-cooling plants to await the end of the disturbance. Eastern markets have already advanced $1.00 per box nearly all along the line. Late dispatches show the market advancing on both oranges and lemons, especially in New York and Boston.

Lemon shipments are very light, as is also the demand in Eastern centers. A few f. o. b. California sales are being made for ocean shipment up coast. Fifty-five thousand boxes of forcign lemons are received in Eastern ports and will soon be put on the market.

Shipments

Shipments of citrus fruits to date since November 1, 1918; Southern California Oranges, 30,921 cars, lemons 8787, total 39,708. To same date last season: oranges, 13,331, lemons 5296, total 18,627. Central California this season: oranges 4427, lemons 354, total 4781. To same date last season: oranges, 2539, lemons 115, total 2654. Northern California oranges, 244, lemons 2, total 246. Last year same date: oranges, 203.

Eggo-O-Latum Keeps Eggs One Year
It costs only one cent per dozen eggs to use Egg-o-latum. There is no other expense. Eggs are kept in carton or box in cellar. Eggs may be boiled, poached or used in any other way just like fresh eggs. Simply rubbed on the eggs a dozen per minute. A 50c jar is sufficient for 3 dozen eggs. At Drug, Seed and Poultry Supply Stores or postpaid.
GEO. H. LEE CO., Dept. 418. OMAHA, NEB.

It takes Brains to recognize a Good Tractor

WHEN you build a tractor to be sold on the basis of the service it gives, it has got to be sold to a man of brains.

Appearances speak for themselves.

Anybody can tell what a Tractor looks like—whether it has three wheels or four, whether the engine is upright or horizontal, whether its gears are enclosed or at the mercy of sand or gravel.

But it takes brains to get at the facts—to look into tractors instead of merely at them.

More and more, the farmers of this country are looking for the facts which determine the serviceability, economy and long life of a tractor.

And they are finding them in the G O type of tractor—the four-wheel, four-cylinder type, towards which the whole industry is tending. There are no tracks or sprockets in the G O Tractor to become filled with sand or to use up power in overcoming friction.

They are finding them in the G O driving mechanism—an exclusive feature which cannot be duplicated or imitated. With the G O friction drive, there is no possibility of stripping gears, because they are always in mesh. The speed of the tractor can be changed while in motion. It can be adjusted to any kind of work either in the field or at the belt—there are six speeds forward and six reverse.

They are finding them in the G O construction—so simple that anyone can keep it running strong and true. Every part is accessible. Every gear is enclosed in dust-proof casings—runs in oil. The driving wheels are independently controlled, making it easy to turn short, plow close to corners or pull out of any hole.

The man of brains, who is looking for more facts—for facts about the company behind the G O Tractor, its resources, its guarantee, and its idea of tractor service—can get them without obligation by addressing any of the offices below.

The Winchester Pattern. 320 pellets out of a possible 431, or 74% of the shot charge, evenly distributed; no birds get through

How big a bag will *you* bring back?

THE difference between a bulging bag and a lean one is often a question of gun and shells and not of shooting skill.

Make sure you have the right game-getting combination—shells that kill when the aim is true, and a gun that enables the shell to make its best pattern.

Good shell patterns are either *allowed* or *prevented* by the character of the gun barrel—the chamber, bore and choke.

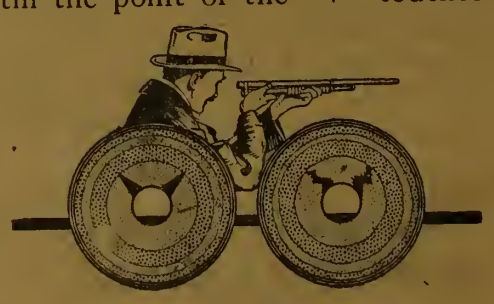
Faulty chambering even more than faulty choking tends to mash and "ball" the shot, making pellets fall short or fly wide.

And if a gun is faulty in its most vital part, the chamber, the chances are that the bore is also carelessly made.

From chamber to choke, the barrels of the famous Winchester Repeaters are bored to make the shell throw its highest pattern. They are free from shot-jamming defects. They let the shell do its full work.

"Line" test the barrel

Point a Winchester barrel toward the light and look through the bore. It looks like a highly polished mirror. Not a false shadow throughout the bore. Sight through the bore at a horizontal black line on the window. This line will throw a "V" shadow in the bore. Tilt the barrel till the point of the "V" touches the muzzle. The perfect "V" shows absence of irregularities.



The "Line" test

Perfect bore of Winchester barrel revealed under "Line" test.

Irregularities revealed in inferior shotgun barrel under "Line" test.

This is the "Line" test of a perfect bore. No faulty barrel can pass this test—the "V" will be distorted.

What (WP) means

This mark on a Winchester barrel means that the gun has passed the "Winchester Provisional and Definitive Proof" test, having been fired many times for smooth action and accuracy, and strength-tested by firing 25 to 40 per cent excess loads. This stamp stands for Winchester's guarantee of quality, with 50 years of the best gun-making reputation behind it.

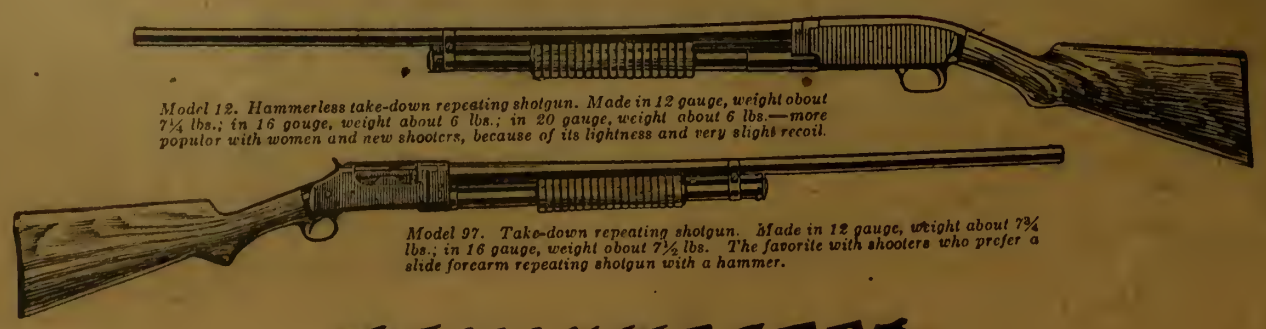
Your dealer will show you Winchester Guns and Ammunition

Before you take to the woods this Fall, get your dealer to show you a Winchester Repeater—Model 97 for hammer action; Model 12 for hammerless. Put one to your shoulder, try its balance, see how beautifully it handles. Your sportsman's instinct will tell you it's the best weapon you could choose. Leading hardware and sporting goods dealers in every community carry Winchester Arms and Ammunition. They will be glad to assist you in selecting the gun best suited to your needs. Upon request, we will mail you, free of charge, the complete catalog of Winchester guns and loaded shells.

WINCHESTER REPEATING ARMS CO.
Dept. 107 New Haven Conn., U. S. A.

Important Notice

The chamber, bore and muzzle choke of all Winchester Shotguns are *reamed* to micrometer measurements for the particular Winchester Shells they are meant to shoot. You will get the highest and most uniform pattern results by shooting Winchester shells in Winchester guns. The two are made for each other.



Model 12. Hammerless take-down repeating shotgun. Made in 12 gauge, weight about 7¼ lbs.; in 16 gauge, weight about 6 lbs.; in 20 gauge, weight about 6 lbs.—more popular with women and new shooters, because of its lightness and very slight recoil.

Model 97. Take-down repeating shotgun. Made in 12 gauge, weight about 7¾ lbs.; in 16 gauge, weight about 7½ lbs. The favorite with shooters who prefer a slide forearm repeating shotgun with a hammer.

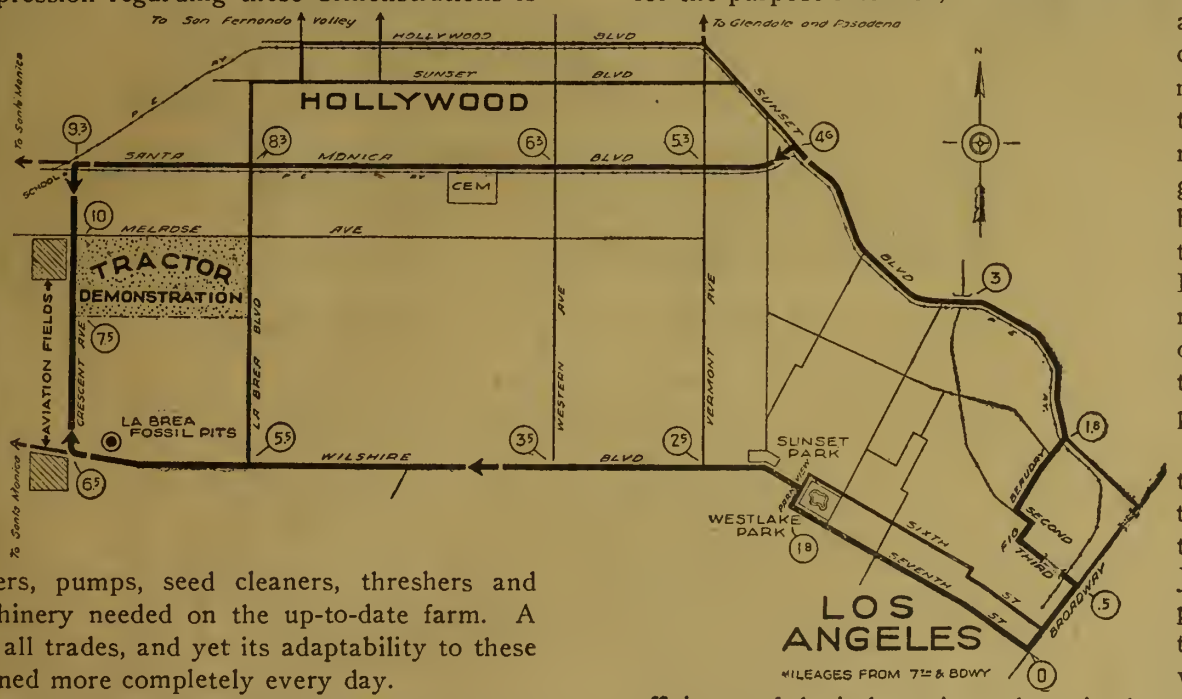
Vol. LIII — September 13, 1919 — No. 11

Tractor Demonstration at LaBrea Field, Los Angeles

EFFICIENT farm equipment, or world's progress toward better farming, will be given fullest demonstration at the Fourth Annual Demonstration of the Traction Engine and Implement Dealers' Association of Southern California at La Brea Field near Los Angeles next week. The demonstration opens on Tuesday morning, September 16, and continues until and including the 21st. Every farmer who would make his place produce to the limit, whether he is yet in a position to give it complete equipment or not, should take advantage of this opportunity and be informed of the latest in implements and power. We say in implements, for perhaps the general impression regarding these demonstrations is that they are tractor demonstrations. They are that and much more, for, anxious to show the adaptability of their tractors to all problems confronting the farmer, the tractor people have secured fullest cooperation on the part of manufacturers of plows, harrows, disks, subsoilers, and, more than ever, are also showing the tractor's adaptability as a power for running silage cutters, pumps, seed cleaners, threshers and elevators or other machinery needed on the up-to-date farm. A tractor is not a Jack of all trades, and yet its adaptability to these many uses is being learned more completely every day.



Speaking at the recent National at Wichita, Kansas, Governor Allen of that state said: "The most important peace which can be brought about in the world today will be that which comes from the marvelously productive period we are now bringing about by power farming."

One of the evils of present farming the governor said, is absentee landlordism. Farming in his opinion should be done by the men who live on the farms. The world needs a larger number of farms. Men will fight for the farms upon which they live, but won't fight for their boarding houses. The fact that France is largely divided into small farms upon which their owners live was credited by Governor Allen with the downfall of German propaganda, and the governor through two years of Red Cross and Y. M. C. A. work in France had opportunities for reaching such conclusions.

Many a farmer will go to the demonstration with this one question: "Now, which is the tractor I want for my problem in hand?" But that is a question that will not receive definite and positive answer other than through the farmer's own observations, with the knowledge of his own problems. In general he will learn that the tractor can be made to plow and disk when the ground is soft and do the same work in the summer when the ground is hard. It must operate a great variety of belt machinery, and working out these various problems is highly important.

Demonstrations of power for orchard and field use have convinced farmers generally that tractors are practical. The demonstrations, however, do not conclusively prove that tractors are a success in every case with every farmer. It takes work, week in and week out, in the hands of farmers to determine this.

A large Eastern manufacturer recently remarked "The sooner we realize that we must make an absolutely dependable machine for the purpose intended, the sooner we will have served ourselves and those who purchase them." Fortunately the realization of this problem before the manufacturer has been general, and we do not believe there will be a tractor displayed on La Brea field which has not had the honest endeavor of its manufacturer behind every piece of metal in it.

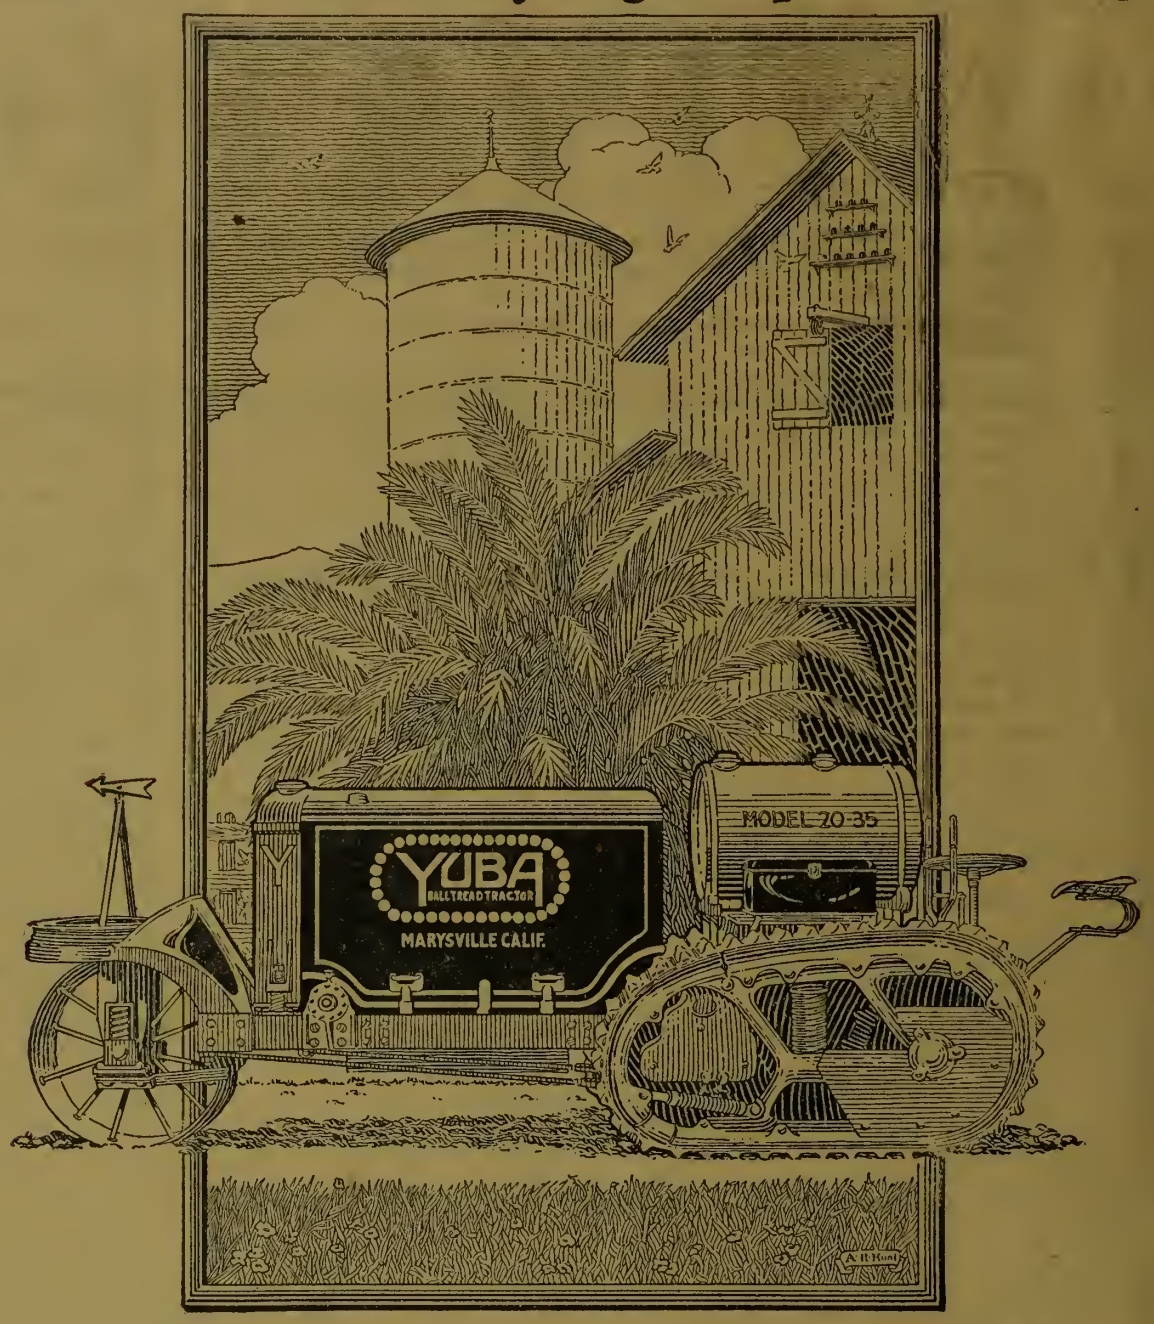
Commenting on getting the most out of tractor demonstrations the Chilton Tractor Journal says: "The primary purpose of tractor demonstrations was to establish the efficiency of the industry's products in the minds of the farmers for whom, of course, they were designed. They have done much to popularize tractors and pave the way for individual sales effort on the part of the individual companies.

"In the earlier days the farmer wanted to know that tractors would work. That they will work is now an established fact with him. What concerns him more now is which tractors will do the work best and whether they will stand up under the gruelling test of long hours of service."

The map shown on this page indicates how to find the demonstration field. From the center of Los Angeles there are two routes via: Sixth or Seventh from Broadway, out Wilshire Boulevard to Crescent Avenue, thence to the right to the big tents. The other route is through the Broadway tunnel, left on Sunset and Santa Monica Boulevards to Crescent. Turn to the left. This map is used by courtesy of the Automobile Club of Southern California.

Officers of the Traction Engine and Implement Dealers' Association of Southern California are: President, H. L. Marsh; Vice President, R. B. Dunsmore; Treasurer, J. B. Graves; Secretary-Manager, R. M. O'Neill. The directors are Messrs. H. L. Marsh. R. B. Dunsmore, A. W. Hudson, J. A. Hymer, M. Schartzman.

THE YUBA—*the tractor of highest price and highest quality*



The reasons for the price are in the tractor

—In the materials used—alloy steels wherever the life of a part may be prolonged; wherever strength may be increased; wherever the bulk may be reduced.

—In the workmanship—the degree of skill in machining the vital parts; the precision by which smooth-working is assured; the infinite care given minute details.

—In the *ball tread* principle, proved by five years' experience to be unequalled in delivering to the draw-bar the maximum percentage of motor power.

The high price is your guaranty against breakdown, loss of valuable time, big repair bills, annoyance; it insures getting your work done as you want it—and when you want it!

"The YUBA price is the right price for YUBA value!"

There are three sizes of YUBA Ball Tread Tractors: 12-20, 20-35, 40-70
Write us for the catalogue of the size you need; tell us how many acres you farm and the kind of soil

Fourth Annual Tractor Demonstration

A Glimpse at Implements and Tractors in Miniature

From top down:—Delco Light exhibit near educational building. Next is the Rotary Grain Cleaner which was constantly in operation. Madewell pipe, true to name. One of the newer introductions, the Four Drive Tractor. Yuba, an old time favorite. Lauson, the "Pattern Tractor", more like the real thing. Dreaming of the trenches on the steps of the Caterpillar. Averys, a whole battery of them. The Monarch looks strong enough to rule.

THE TENTS are pitched; the last stake is set; even the exhibits are placed for the great Los Angeles tractor demonstration September 16-21. The grounds selected are on the Rancho La Brea west of Los Angeles, at the corner of Crescent and Melrose Avenues.

There has been a slight change in plans over those followed in preceding years, in this, that there will be no public contest, or general try-out, of all the tractors, during the afternoon. There will be demonstrations of the power of the tractors, of their efficiency and of the ability of the farming implements to handle the soil, but these will be conducted by each exhibitor as he prefers or, rather, we are assured, will be conducted by the exhibitor for the prospective buyer as he prefers. The tractor people are saying to the possible buyer: "Come on and state your problems, and we will show you how efficiency and economy are secured."

There are many other reasons why the rancher should take the necessary time to attend this fourth annual demonstration of power farming, for example:

One of the most attractive exhibits ever offered the rancher, of trucks, trailers, magnetos, spark plugs, piston rings, lubricating oils, in fact every accessory that can be used on tractor, truck or automobile, will be shown under a tent 100 feet by 350 feet in length. This exhibit in itself is an education to a great many of the visitors, and one could spend at least two days inspecting it to a great advantage.

Manager R. M. O'Neill states that reports already received from nearly every section of Southern California, and in several instances from points farther north, indicate an attendance at the approaching meet far in excess of that of any previous year.

The educational features of these annual demonstrations undoubtedly are responsible for the increasing interest shown each year by both dealers and consumers. The former recognize them as opportunities for coming in direct contact with the prospective user and in numbers not possible in any other manner; the latter as occasions for determining the tractor, implement and accessory best adapted to his needs.

The entire week will be full of interest to visitors, as every conceivable type of farm machinery will be seen in operation, including tractors, hay balers, feed cutters, threshers, separators and harvesters.

Of the exhibitors the A. F. George Company will show the following:

Yuba tractors in sizes 12-20, 20-35 and 40-70; John Deere tractor moldboard and disc plows; John Deere tractor disc harrows; John Deere packers and pulverizers, manure spreaders, corn binders, ensilage cutters operated by tractor, hay press operated by tractor, feed mill also operated by tractor and many small tools will be included in this exhibit.

The Los Angeles Auto Tractor Company will exhibit the Little Bear tractor especially adapted for orchard and small ranch work.

Fageol Truck and Tractor Company will exhibit their line of trucks and their latest improved model tractor with walking wheel.

The Electric Wheel Company of Quincy, Illinois, L. M. Railsback, Los Angeles representative, will demonstrate its latest model, a specially built California orchard tractor known as the Allwork 2nd.

Arnott & Company's exhibit will include Superior grain drills, Sanders disc plows, Imperial peg, disc spring tooth harrows and plows, Walter A. Woods harvesting and tillage tools, Farquahar bean and grain threshers, American bean threshers, the Iron Age line manufactured by the American Bateman Manufacturing Company and the McKay disc plow. This will be the first demonstration of this implement on the Pacific Coast.

The Washburn Bros. will demonstrate the Sandusky tractor. Model D 10-20 and the Model E 15-35.

Community Manufacturing Company, which is composed of local business men having a plant in West Alhambra, will offer for the first time at any tractor demonstration the Allen Model A 10-20 tractor. This tractor is suitable for orchards and ranches of small acreage.

The Smith Bros. will demonstrate the 12-20 Cleveland track type.

Douglas Boswell Company will demonstrate the J. I. Case Plow Company Wallis Cub 32-50 and the Wallis Cub Jr. 18-30; also a full and complete line of J. I. Case Plow Works implements.

Education in tractors can be obtained in many ways. The most thorough way is by visiting these annual demonstrations where one can make so many favorable comparisons, as every tractor of standing on the Pacific Coast can be seen on the same field, also a most complete line of power farming machinery.

A great many ranchers have held off placing orders for tractors and implements that are actually needed on the farm in hopes that prices will tumble, but such is not the case; if anything, they will go up, as that is the tone of the metal market today.

Other exhibitors will be the Bean Spray Pump Company, who will exhibit the Bean TrackPULL orchard tractor, and a complete line of spray pumps. California Moline Plow Company will have on exhibit six Universal tractors equipped with grain drill, corn binder, power lift disc harrow, power lift gang plow, both disc and moldboard, and a tractor mower. The Knapp Tractor and Machinery Company will show for the first time in Southern California demonstrations of the La Crosse tractors in two sizes, 6-12 and 12-24, also a complete line of implements. Oliver Chilled Plow Company will have on exhibit a full line of Oliver implements. Union Tool Company will show their Sure Grip 12-25. Frank O. Rellstrom Company will exhibit for the first time the Twin City tractor.

There will also be one of the most interesting and complete exhibits of accessories for tractors, trucks and autos ever assembled under one tent, including an excellent exhibit of trucks, pumps, irrigation machinery, and all kinds of household necessities; in fact, everything one can use.

State Fair in its Commercial Aspects

By M. C. Holman

WHATEVER may be said concerning the state fair as the centralization of agricultural and horticultural perfection may also be said for its commercial features. We keenly admire the gems of the garden and the field; we revel in the perfection of the fruits of the orchards; we delight in the handiwork from the schools and the homes and we marvel in the selections from the pens and the corrals. But let us not, in our anxiety to praise the works of nature and the development through man's ingenuity, forget that the achievements of machinery measure well forward in our category of pleasurable sights at the state fair.

We are sometimes given to thinking that the exhibits represent but a form of advertising; that the manufacturers are simply pushing their wares to their own advantage. But let us not forget that advertising always tends to bring out the best; it shows improvements that make for better living and more comforts, and whether the advertising is done through publications of general circulation, such as the Cultivator, or whether it is done by means of displays, such as those at fairs, the one chief end is achieved, that of bringing to light something that was before unknown. And so, we can look with pleasurable interest upon the store, the factory and the shop side of the state fair, for therein will be found exhibits of extreme utility.

As we pass through the gates we are at once impressed with the intense interest of the surroundings. Flags are everywhere; tents are spread in profusion; crowds are surging in and out of the buildings; sailors and soldiers are drilling on the big

Continued on Page 338

Agricultural News Notes of the Pacific Coast

Northern California

Calaveras County reports several destructive forest fires.

California Almond Growers Exchange now has 3000 members.

Hopland Ranch is sending 2000 year old White Leghorn hens to Kembo Farm, Hawaii.

Red spider is causing much damage to walnut trees around Sonora, Tuolumne County.

A cow testing association has been organized by dairymen of Sonoma and Marin Counties.

The Nevada County farm bureau held a live stock auction at Limekiln Ranch on September 2.

El Dorado County pear growers are getting very satisfactory returns from Eastern sales of Bartletts.

Orland is busy getting the fair grounds in readiness for the Glenn County Fair, which opens September 22.

Two big De Haviland bombing planes will be used in the national forest fire protection service in Shasta County.

The junior agricultural clubs of the El Dorado County farm bureau will hold a two day fair at Placerville in October.

The Chico district of Butte County claims 17 per cent of the membership of the California Almond Growers Exchange.

Wheatland farm center, Yuba County, will be host to farm centers throughout the county at a big picnic to be given September 20

Gravenstein packing is practically completed in Sonoma County. In the beginning of the season growers were receiving around $2.25 net per box.

The Nevada County farm bureau will hold local meetings at Gold Hill, September 15; Weimar, 17; Long Valley, 19; Roseville, 22; Colfax, 24; Mt. Vernon, 27.

The most unusual run of salmon in seven years in the Klamath River occurred near Requa last week. Fishermen swamped the canneries with salmon. Many fish were placed on local market.

The members of the Alameda County farm bureau are petitioning the board of supervisors for funds sufficient to secure the services of an assistant adviser and home demonstration agent.

The Capay Stock Company of Dixon, Solano County, has about completed a modern lambing barn 200x80 feet, with cribs and pens from 15 to 20 feet wide. A silo is now being built and will be filled with Indian corn.

Rice growers and others of Butte County are objecting to the ordinance passed by the board of supervisors limiting the load which a motor truck may haul over county roads to 12,000 pounds gross. The ordinance goes into effect October 1.

Poultry growers of the district about Hayward, Alameda County, organized a poultry club August 22, electing A. J. Hoffman of San Leandro, president; W. D. Froeman, Castro Valley, vice president; F. A. Holston, Castro Valley, 2nd vice president; Mrs. W. D. McCord, Hayward, secretary-treasurer. Tho next meeting will be held September 16.

Central California

Tulare is planning for a county fair in the fall.

Montèrey County will hold its fair October 10-11.

Ceres hopes soon to have a big jam factory located there.

Mustard crops of the Salinas Valley are showing heavy yield.

Pajaro Valley shippers of apples are getting the best of prices.

A squirrel campaign has been started at Kerman, Fresno County.

Prices for grapes in the Hanford section range from $25 to $32.50.

San Joaquin County will hold its fair at Stockton, October 7-11.

Petitions for the formation of the accepted by the board of supervisors.

The new plant at Turlock for curing sweet potatoes is nearly ready for use.

The market for cantaloupes and watermelons has not been so good recently.

Kerman peach growers are delivering peaches to the packing house at Biola.

The Lindsay branch of the California Associated Olive Growers met August 30.

The sugar factory at Spreckels, Monterey County, began slicing beets September 8.

Poland-China men are planning for a big sale to be pulled off at Lodi, September 19.

Alex. Rousseau, San Rafael, has been appointed cow tester of the Stanislaus association.

The big new packing plant of the California Peach Growers Inc. at Hanford is nearly ready for operation.

The annual meeting of the California Associated Olive Growers was held at San Francisco September 3.

Live stock men and others held a meeting at Modesto August 26 to discuss ways and means of securing fair grounds for Modesto.

Ladybirds from Tuolumne are being sold to bean growers of Stanislaus County for release in their bean fields to destroy the black aphis.

The first annual district fair held by the Patterson Fair Association was a great success. Live stock exhibits were the big feature of the fair.

During July the Tulare Cooperative Poultry Association showed receipts of $11,000 for eggs, a total of $24,045.81 for all poultry products sold.

At the hog auction at Tegner last week 181 hogs were disposed of at prices ranging from $18.25 to $19.50. The sale netted the owners $7,197.05.

The bean growers of Stanislaus County have received a stock of lady birds from the state insectary. These were collected in Tuolumne County and will be used in the bean fields to keep down the aphis.

A mass meeting of shippers and growers was held at the Turlock high school August 15 to discuss the employing of a pathologist and establishing an experimental farm in Turlock, the work to be financed by growers interested.

Membership in the San Joaquin Valley Milk Producers' Association now requires minimum membership fee of $5 instead of the former $50. This change is made to allow owners of one cow to onter the association.

Southern California

Ventura holds its county fair September 24-27.

The Covina Citrus Association will fumigate 1200 acres for members.

Cotton seed, it is announced, will sell in Blythe this year for $57 a ton.

Reports that the sugar factory at Chino would operate this season are denied.

The peach canning season is at its height in the Pomona district. Tomatoes will come next.

The marmalade factory at San Dimas closed down several days owing to the railroad strike.

Charles Shiels of San Jacinto has been appointed Riverside County sealer of weights and measures.

The Whittier Walnut Growers Association has erected a modern packing plant on the state highway east of Whittier.

The Claremont Citrus Association received a total of over half a million dollars for 417 cars of fruit shipped the past year.

The La Verne Fruit Exchange has been organized with B. A. Woodford as president and D. G. Arbuthnot, secretary-manager.

Ventura County beans are said to average up well with beans in other districts. The yield throughout the state is spotted.

Several machine loads of farmers from the Apple Valley farm center attended the live stock meeting at Chino last week.

The Santa Barbara Walnut Growers Association reports many applications by pickers for jobs in the harvest which will soon begin.

Plans to divert water from Lake Elsinore for irrigating Orange County lands are being strenuously opposed by residents of Elsinore.

Sale of $800,000 worth of bonds to complete the Palo-Verde irrigation system to the county line has been approved by the levee board.

Ranchers living west of Blythe, Riverside County, are protesting against frequent flooding of roads which they say is the fault of the water company.

The Traction Engine and Implement Dealers of Southern California will hold its big demonstration September 16 to 21 on the Rancho La Brea, west of Los Angeles.

The value of the pre-cooling plants has been amply demonstrated during the recent strike, when hundreds of cars of packed fruit were saved which in other years would have been seriously damaged.

Floyd Hatfield, working with fumigation gang in Anaheim, Orange County, was killed by an explosion of hydrocyanic acid as he was withdrawing from the tank a supply for use under fumigation tents. The young man had just returned from two years' service in France.

Hemet canneries are planning to secure some outside fruit to supplement the local supply in order to keep their plants running throughout the season.

State fruit inspectors are warning dealers to secure from ranchers certificate guaranteeing fruit to be up to standard; otherwise the dealer will be liable for violating the standardization law.

The Coast and General

Alfalfa seed threshing is in full swing in the Yuma Valley of Arizona.

The fall round-ups are beginning in Cochise and Santa Cruz Counties, Arizona.

Olive experts predict that this year's crop of olives in the Salt River Valley of Arizona will be larger than ever before.

Early Baart wheat on the Salt River Valley experimental farm at Mesa, Arizona, yielded this year 64 bushels per acre.

Recent storms in the Salt River Valley of Arizona, it is believed, have damaged the cotton crop from $400,000 to $500,000.

Pineapple growers of Florida have organized an association. One of the first activities will be to carry on experiments to determine, if possible, the cause of pineapple wilt.

The Arizona live stock sanitary board is advocating a wire fence along the international line between Arizona and Mexico. It is believed that such a fence would have a tendency to check some of the cattle rustling which is becoming a serious matter.

Ranges are poor in the central plains states, the Northwest and the Pacific Coast states and arrangements are being made to ship in cattle from some of these districts to the Arizona ranges. It is too early to say what proportions this movement will assume.

A new $300,000 gin plant has just been built in Phoenix and is ready to begin operations. It is believed that the ginning capacity in the Salt River Valley of Arizona will this year be sufficient to take care of the increased crop without much delay to the growers.

A cooperative prune dryer to care for the prune crop of Clarke County, Washington, will be constructed by the growers at Vancouver at a cost of $50,000. There are approximately 5000 acres of bearing prunes in the county, and it is expected that the owners of at least 98 per cent of these will become affiliated with the association.

A favorable report has been made for the construction of a dam on the Hassayampa River, Arizona, to irrigate about 20,000 acres of land west of Hot Springs Junction. This dam will be on the site of the old Walnut Grove dam, an earth and stone structure which went out in a flood in February, 1890. A concrete dam is proposed which will be permanent.

Government control of Egyptian cotton in Egypt has ceased and the price has advanced about $100 per bale, according to advices from the American consul at Alexandria, Egypt as reported by the United States bureau of markets. The shipments of Egyptian cotton in the United States during 1918 have been 82,000,000 Egyptian bales, averaging 750 pounds each

The Arizona state tax commission has just mado some estimates of the population of the state by counties These ostimates are made by using the school census as a basis, multiplying the figures by the samo ratio as the school census of 1910 bore to the census figuros of the population. This shows the state to havo a population of 389.751. Maricopa County leads with 84,519

Live Stock at the State Fair

By R. P. Royce

WHEN judged from any angle the show of live stock at the 1919 California state fair furnished high satisfaction to the live stock interests of this state and indicated in very forceful manner the progress being made with all breeds. In point of numbers the entries broke few records but the quality that prevailed down the entire line was of greater average excellence than any former exhibit at Sacramento.

Every One a Champion

In the dairy row, just a glimpse at some of the stock of which Van Pelt said "I have attended fairs and stock shows from the Atlantic to the Pacific and judged in many a state but never saw a finer exhibit of better quality stuff than you have here in your own state fair." Reading from top down they are:

1—Imp. Holehouse Secretary, grand champion Ayrshire bull owned by J. Henry Meyer. 2—Highland Itham, grand champion Ayrshire cow owned by J. Henry Meyer. 3—King Segis Alcartra Prilly, grand champion Holstein bull owned by Bridgford Holstein Company. 4—Empress Pontiac Prilly, grand champion Holstein female owned by Bridgford Holstein Co. 5—May King of Fernridge, grand champion Guernsey bull owned by Elliott-Brant Rancho.

While the rail strike in Southeru California kept a number of good herds away; by far the majority of exhibitors occupied the stails and pens they had reserved.

As soon as the directors of the state fair decided there would be no postponement plans were shaped to take care of late arrivals by delaying the judging until such a time as they could reach the show. The fine spirit manifested by the exhibitors who arrived early in agreeing to wait for more competition resulted in bringing together a live stock exhibit that the state can well be proud of.

Exhibits from the strike area came by truck, boat and express.

The show was well balanced throughout and it would be difficult to claim that any one breed made the outstanding display. As a whole, it can be stated as a fact that the entries were the best fitted yet seen at Sacramento. Each year marked improvement is noted and exhibitors are coming to the show with more uniform herds and flocks and the difference between the top and bottom of the classes is not so noticeable as a few years back.

The judging this year was done by men of national reputation and their ratings met with more general satisfaction than this state is accustomed to. Each of the judges admitted their surprise at the quality of the show and predicted that the natural conditions of this state were such as to assure that California is destined to become one of the first live stock states. California breeders are just beginning to realize that they are operating under conditions that are more favorable to production than are found in any other section and they are taking courage and improving and strengthening their breeding herds with a determination that will mean much in the future. The attitude of state fair visitors is changing too. Few come out of curiosity. They come to learn and investigate the various herds and to buy. During the judging the ringsides were crowded with interested spectators and a continuous stream of visitors were in the barns.

Now is the time for California to anticipate the future from a live stock standpoint and to prepare. Granted that this state has a wonderful future, and keeping in mind the rapid growth of the live stock industry of the past few years, it is not too early to plan for additional equipment for housing and judging. The fair board has prepared plans for improving the grounds but a large amount of money will be required and it will be largely up to the live stock men of this state as to how soon the necessary money is made available.

Another important development that is certain to demand attention is the question of fitting the state fair to a schedule including the Los Angeles and San Francisco shows. In the event that those shows become permanent, the state fair will either have to be set for a later date or the new shows will need to be held earlier if the most is to be made of all three. With as much time intervening as exists at present, either the state fair or the others will suffer. Exhibitors will not fit for an early show, ship home and attempt to make the later dates. As to what time would be best for all is a problem to which great consideration should be given without prejudice.

* * *

THE BEEF CATTLE

By R. P. Royce

The show of beef cattle, while not up to the possibilities of this state, owing to the fact that many herds were not represented, was a high class display of a branch of the live stock industry that promises to undergo a wide extension in the next few years. Events are shaping that will make the California show of Shorthorns and Herefords one of the real shows of the country.

This year's exhibit, while light in numbers, ranks as one of the best shows held in this state in years. Balance was maintained in both the Shorthorn and Hereford divisions and several of the classes reached a high point of quality. For the most part the entries were California bred, a fact that is full of encouragement and significant of what may be expected.

Professor John C. Burns of the University of Texas rated both the Shorthorn and Hereford classes in a manner that was universally satisfactory and in several classes the ribbons were tied with rare artistry. Judge Burns expressed himself as agreeably surprised at the quality of the show, but marvelled at the fact that in a state so preeminently adapted to beef production, there were not more herds on the grounds.

The Herefords

The Hereford classes were judged on Tuesday. Three California herds and one from Colorado contested for honors. For the first time in the history of the show, polled Herefords made their appearance in the ring and succeeded in giving a very good account of themselves.

H. M. Barngrover had the only aged bull, the six-year-old grandson of Paragon 12th, Patrician 5th. He is a bull of scale, impressively fronted, thick and smooth, though not highly fitted. He had easy sailing to senior championship but fell short of top honors.

The three two-year-olds, with polls in the majority, were headed by Alamo Reuben, the horned entry, with more size than the second and third. Again in the senior yearling class the judge preferred the horned Bunting entry, Alec, nicely fitted and with more size and breed character, to the two polled bulls from Colorado and California. The junior yearling class was made up of two without horns and first place was given to Bonnie Grove from Colorado. The four senior bull calves made an attractive class and the Bunting calf, Mission Princess, looked well at the top over the two good calves shown by Barngrover. Brunton's Repeater Grove was at home in fourth place. When the junior bull calves lined up there were only two, one a polled. The top was

Continued on Page 348.

Grand Champions

A Jersey has broken into the group shown above, but the others are true representatives of the highest and best in California beef breeds. For years California has shown a few remarkably fine beef stock, but there has been a wonderful increase in numbers, likewise in quality, during the past two years. Above are typical examples of California breeding. From top to bottom these animals are:

6—Basham Augusta, grand champion Shorthorn bull owned by Dibblee Estate. 7—Pearl, grand champion Hereford female owned by Brunton, Aspen, Colorado. 8—Foothills Pioneer, grand champion milking Shorthorn bull owned by Thomas Harrison. 9—Little Sweetheart, grand champion Shorthorn cow owned by T. S. Glide, Davis. 10—Jolly Senator Raleigh, grand champion Jersey bull owned by J. E. Thorp.

A GREAT FAIR

"If it hadn't been for that strike we'd have had some fair!"

President Roeding, Secretary Paine—in fact the whole bunch looked real peeved, even vicious, kicked their heels against the brick walls of the big new building and said "Ogoshogosh!"; also some other things which I have forgotten.

Meantime we, the common people, turned to and had a great time doing California's best fair.

However, some of the exhibitors who had to take their exhibits from aboard cars and haul 200 or 300 miles in trucks were at first somewhat concerned over the cost of the experience but were soon enjoying the fair with the rest of us.

My work at the fair was to take notes in the great horticultural building and tell of the fruit and of those county or community exhibits. A series of photographs was secured showing some remarkable exhibits, but as soon as I arrived at the home office it developed that other plans were in the making because of the great tractor demonstration at Los Angeles, so notes and illustrations of some of the most attractive exhibits at the fair will be held over until next issue, September 20.

Meantime information regarding the tractor and implement exhibits is given by Mr. Holman, and Messrs. Royce, Hughes, Guilford and Bennett supply this week a very complete story of the live stock show. It was wonderful in quality, and the numbers were greater than anticipated. These exhibits, however, did suffer seriously because of the strike. For instance, it was said that two carloads of pure bred poultry from south of Tehachapi were held back. The poultry exhibit was, however, most creditable.

More general information next issue.—C. B. M.

Fumigation Regulations

COMMISSIONER H. J. RYAN of Los Angeles County and Commissioners Coy of San Bernardino, Sharp of Riverside and Morris of Orange, have issued a statement of requirements governing commercial fumigators operating in Los Angeles County, which will tend to standardize fumigation practices.

Commissioners of other counties are expected to promulgate practically the same regulations. The regulations are:

Equipment

1. All fumigating tents shall be marked in accordance with the Morrill system.
2. The foreman of each fumigating crew shall be equipped with a tested thermometer.
3. All equipment used by fumigators shall be kept in good repair when in use.
4. No pump shall be operated showing more than a five per cent variation from correct measurement.
5. Liquid gas machines shall be tested by the horticultural inspector each week and no machine shall be used which does not bear tag showing inspector's signature and date of inspection.

Operating

1. Each tent shall be placed so that one line of numerals runs over center of top of tree.
2. Tents shall be kicked in to hang perpendicularly from outer limbs of tree to ground, and shall touch the ground on all sides.
3. Trees requiring more than a four unit charge shall be taped and correct dosage given as called for upon chart.
4. Thermometer reading shall be recorded at beginning of each set and this record kept available during progress of work for reference of grower or county horticultural inspector.
5. Trees shall be given not less than forty-five minutes exposure regardless of dosage, and work of tent pullers shall be regulated accordingly.
6. Trees shall not be fumigated when the temperature is below 37 degrees Fahrenheit.
7. Each fumigator shall submit on the first of each month a report to the county horticultural commissioner showing for each piece of work performed during the previous month; date, grower's name, location of orchard, number of orange or lemon trees, kind of material used and strength.
8. Fumigator shall keep on file and furnish upon request of horticultural commissioner statement of amount of material used on any piece of work.
9. Fumigator shall furnish to the horticultural commissioner at the close of the fumigation season, not later than April 1, a statement of total amount of cyanide or liquid hydrocyanic acid used by him during the preceding twelve months.
10. Deviation from any of the foregoing requirements shall be considered sufficient grounds for revocation of license or certificate unless contractor has filed with the county horticultural commissioner copy of written instructions or agreement by owner or person in charge of property specifying requirements contractor is in instructed to disregard.
11. Evidence of abuse of privilege to do business under license or certificate shall at all times constitute grounds for revocation of same.

Suggestions

1. A record of the dosage given each tree, with the temperature at beginning of each set should be supplied to grower or kept on file by fumigator for reference of grower or horticultural inspector.
2. Not less than one hour's exposure should be given when any black scale eggs are present.
3. Daylight fumigation is not recommended at any time except as generally practiced beginning late in afternoon under most favorable cloudy conditions.
4. Work should not be continued after tents begin to become damp.
5. Care should be taken not to allow liquid containers to become heated. Keep them in a shady place and keep covered with wet sacks.
6. Leakage from liquid gas containers is extremely harmful to tree roots and care should be taken to keep containers far enough from trees to insure safety.

FERNS

"In and around the house ferns are incomparable in respect to the variety, abundance and grace of their foliage," says W. H. Hutchings in the San Francisco Chronicle.

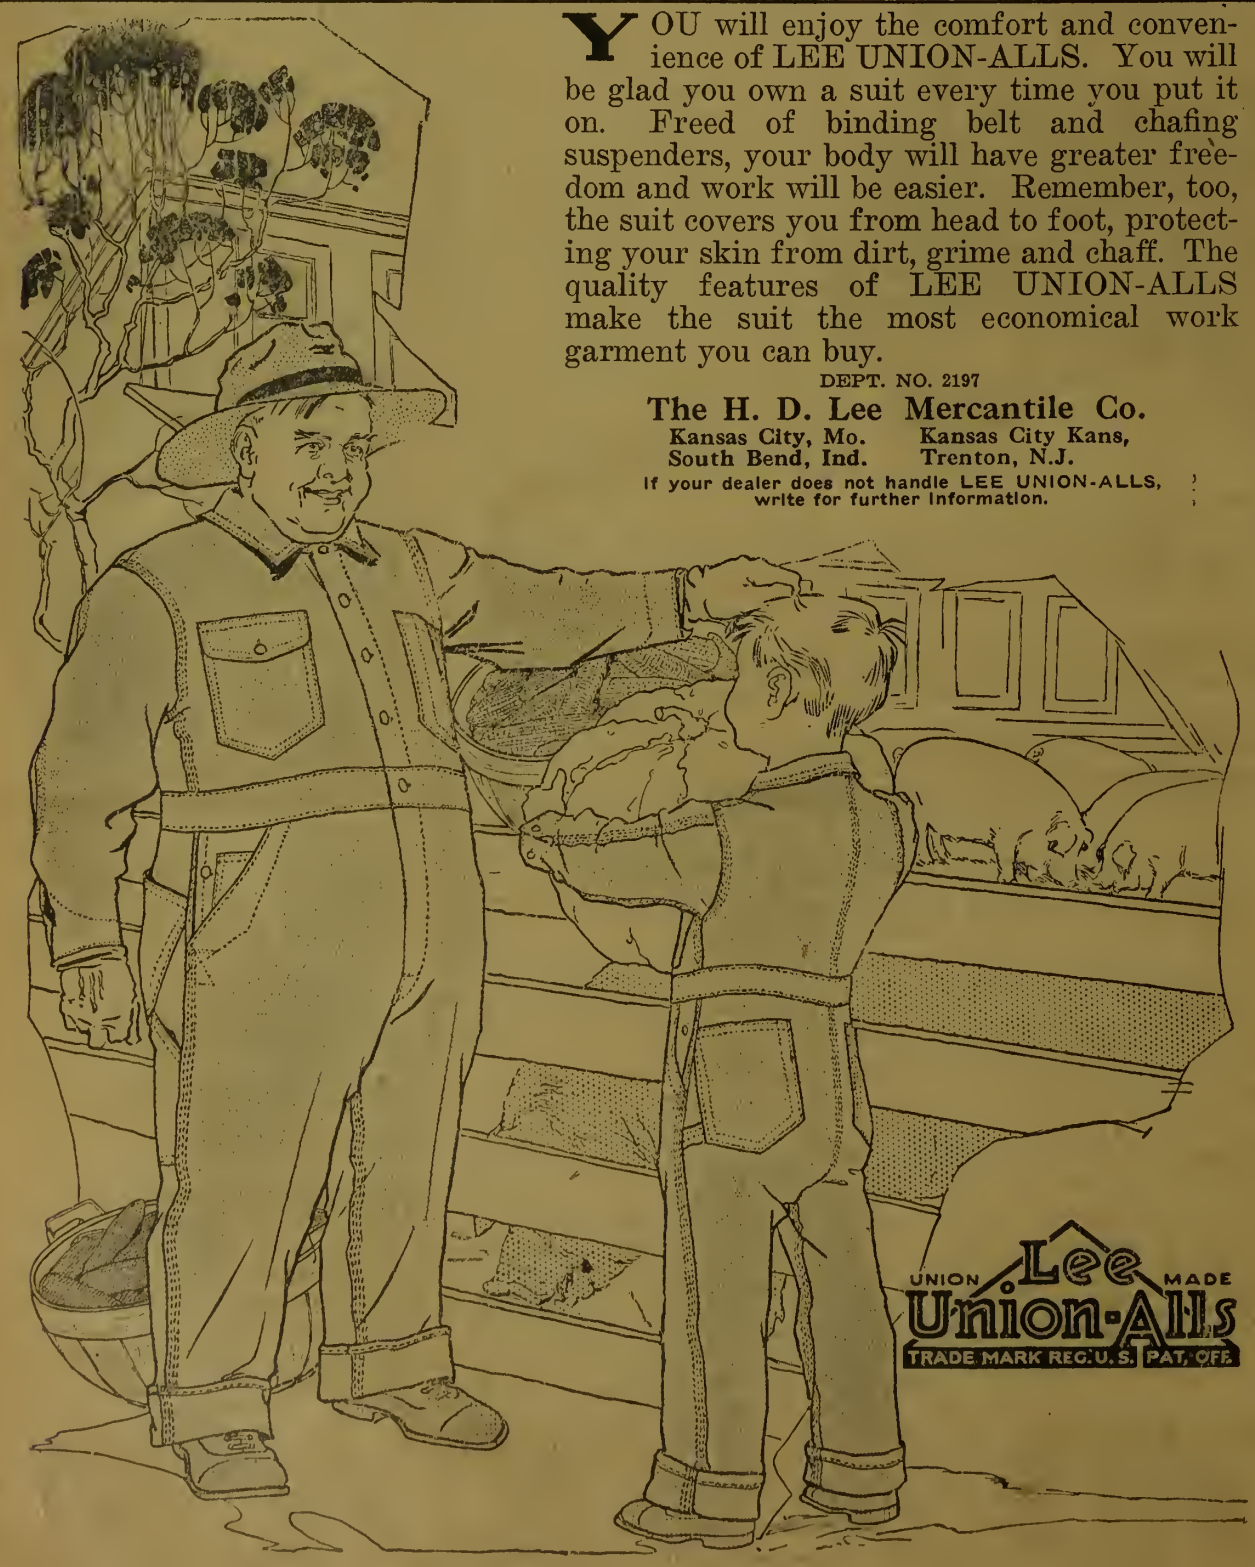
"No other class of plant is so suggestive of the freshness and quiet of the woods. No other class of plant can be so easily maintained in health. They are often perfectly accommodated in nooks so far removed from the light that other plants would not thrive at all.

"The best position for a potted fern is in a very light and well ventilated room close to a window facing east, north or west. Should south enter into the aspect it would generally be advisable to partially darken and keep the room cool during the portion of the day when the sun shines full on the window.

"Watering the plants may be accomplished where they remain—draining into their own saucers or jardinieres and then emptying after each watering except when the plant is evaporating much water in summer. Most ferns will be benefited, however, by being taken outdoors twice a week in the early morning, the pots well soaked if the soil is dry and the foliage given a very light sprinkle and left to stand in the fresh air. They should always be taken in before the sun becomes strong or the wind rises, or the practice may become ruinous.

"Ferns that seem to have outgrown the pot will often be benefited by an occasional dose of liquid fertilizer. Seedmen usually carry preparations for feeding pot plants put up in cartons with instructions for mixing. Common liquid washing ammonia is an excellent plant stimulant if used not stronger than one tablespoonful to a gallon of water. Small or unhealthy plants in a large pot would rarely be benefited by fertilizing. By careful and methodical attention induce a healthy growth—then gradually feed.

"The possibilities for outdoor planting of ferns are but now being fully realized. A lattice summer house or arbor, a pergola, a rocky place under trees, the shady side of the house, the sunless corner where nothing else will grow, after suitable preparation, are ideal places for an infinite variety of beautiful hardy ferns. The usual preparation will be very deep digging, inocrporating a large quantity of light material, preferably leafmold, but anything except fresh manure. The surface should be of a nature that will not cake when dry. If this occurs, better mulch with an inch or two of very old manure, leafmold or shavings."



YOU will enjoy the comfort and convenience of LEE UNION-ALLS. You will be glad you own a suit every time you put it on. Freed of binding belt and chafing suspenders, your body will have greater freedom and work will be easier. Remember, too, the suit covers you from head to foot, protecting your skin from dirt, grime and chaff. The quality features of LEE UNION-ALLS make the suit the most economical work garment you can buy.

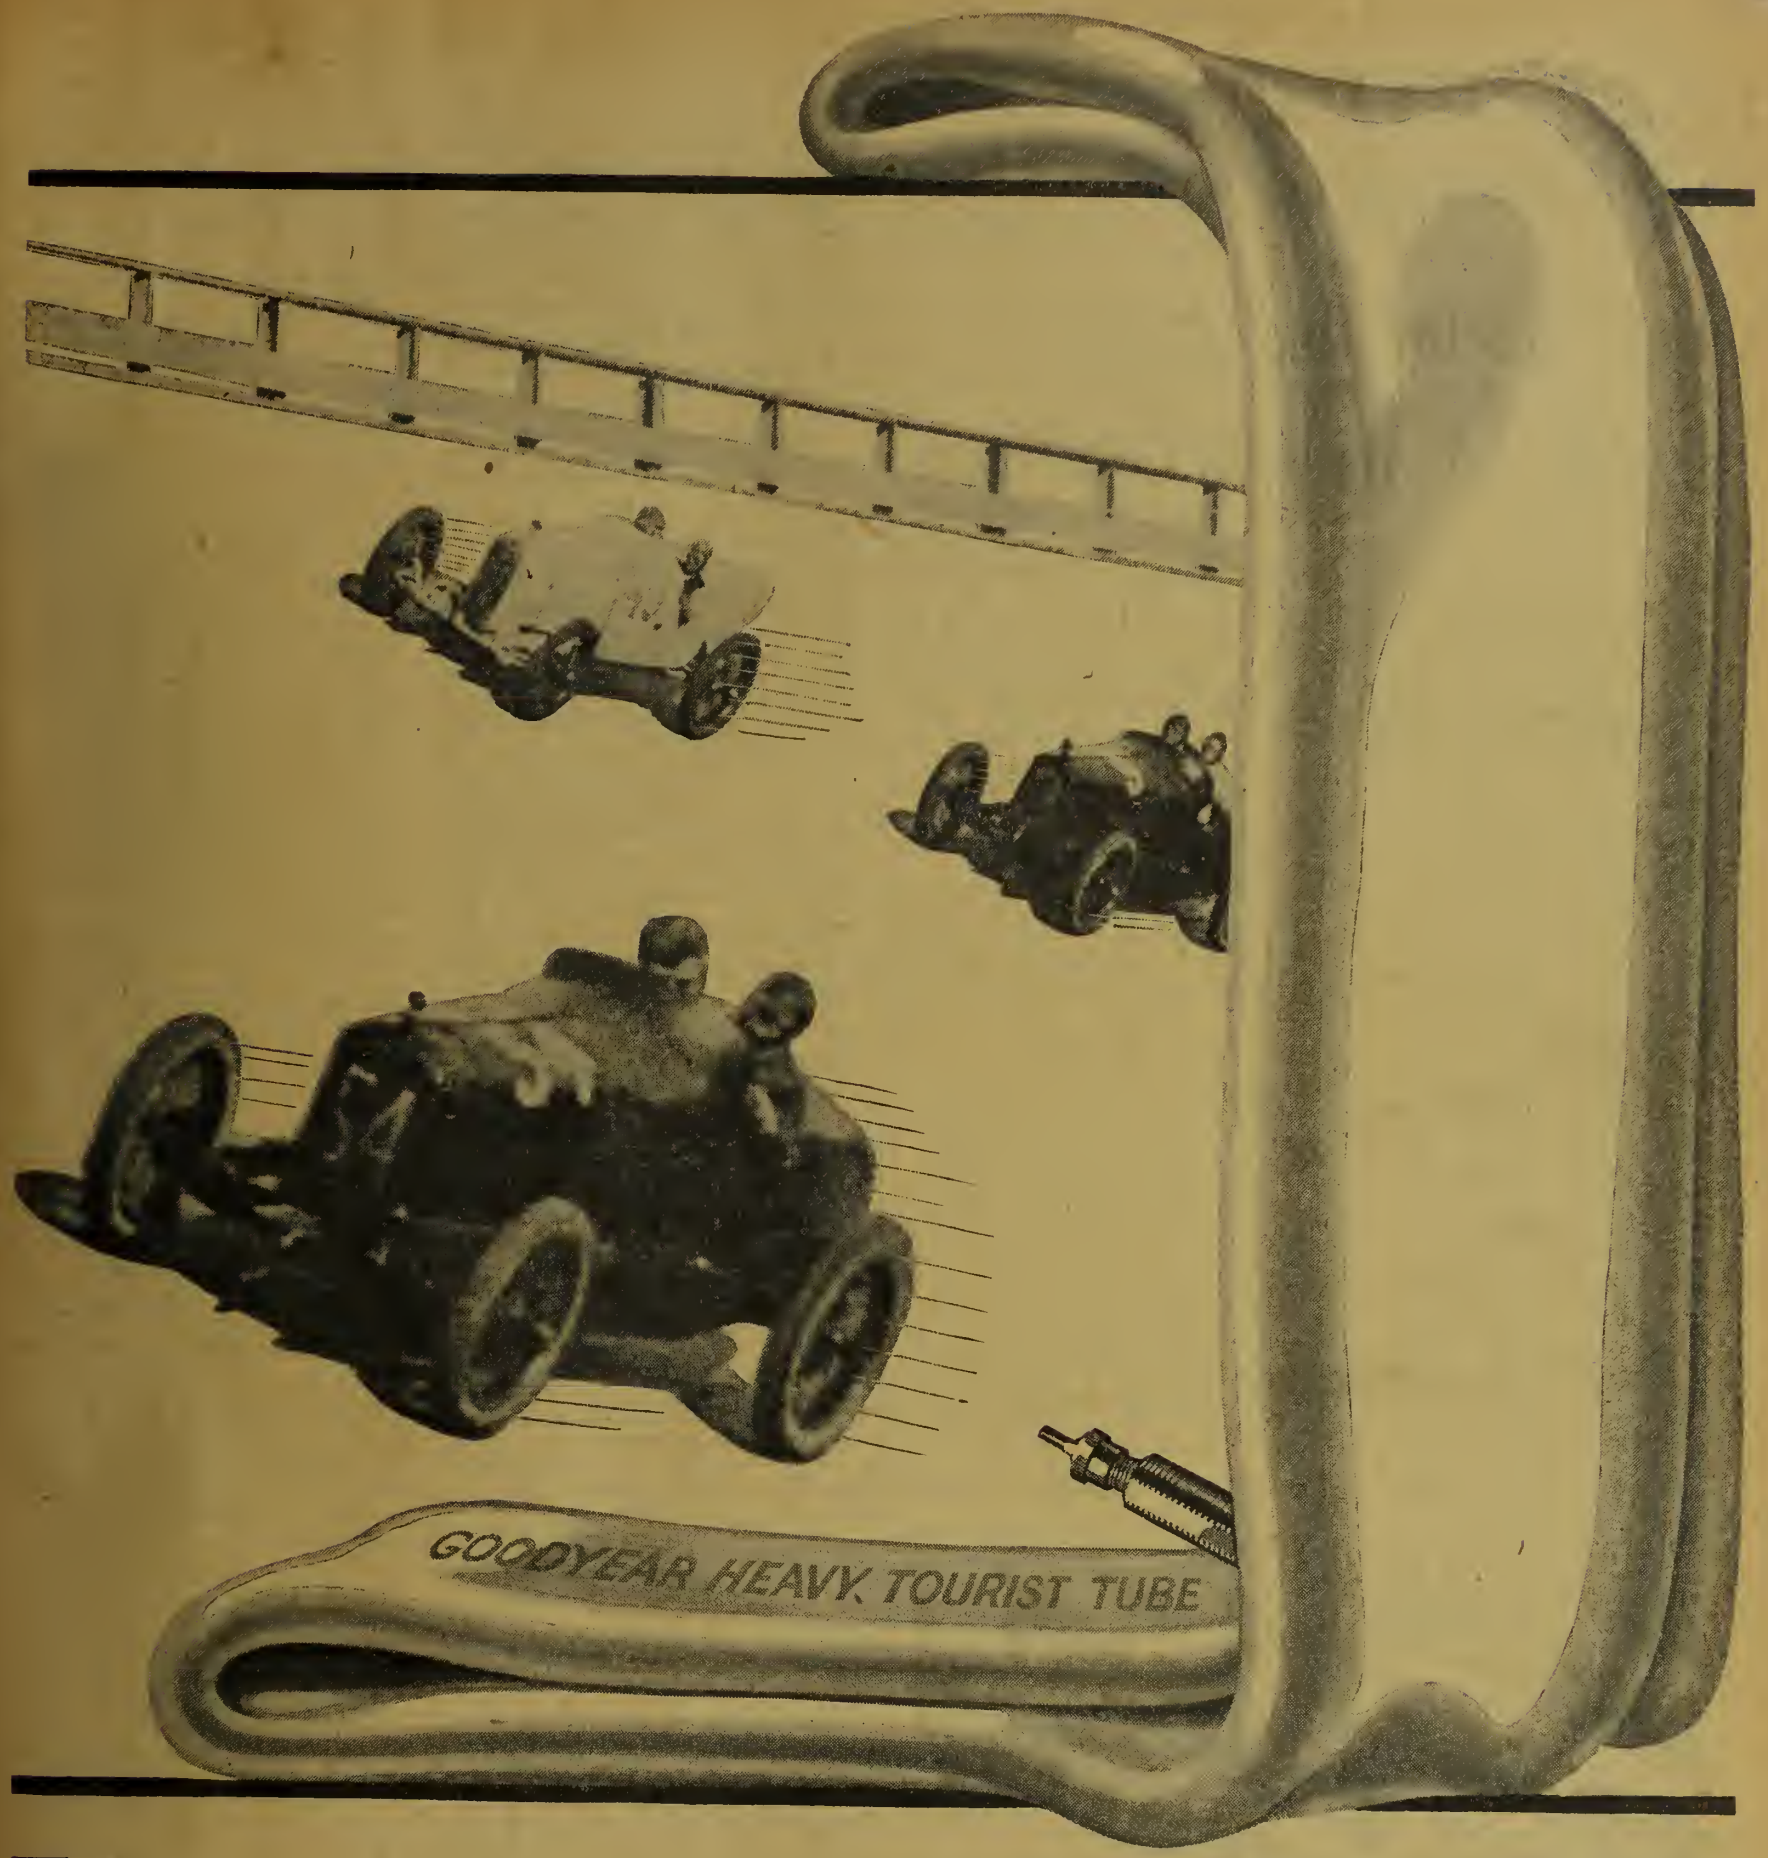
CALIFORNIA'S RICE PROSPECTS

Sacramento Valley's 1919 rice yield per acre will exceed that of any of the Southern States by at least 50 per cent, according to J. R. Leguenec, chief of the rice division of the United States food administration, who is making a personal survey of the crop conditions in the United States. "Without doubt," said Leguenec during his stay in Sacramento, "California will be producing over half the rice crop of the United States within the next five years. A year ago she was in fourth place. From the present outlook she will jump ahead of Texas this year, putting her in second place, and in five years she will probably outstrip Louisiana, which has an enormous output of rice now. I looked over about 1,000,000 acres available for rice land in the Sacramento Valley and that land is capable of growing rice enough to exceed the entire rice output of the United States at the present time."

This year's rice acreage in the valley is 140,000, with an estimated yield of 35 sacks to the acre. So rapidly is the industry developing that rice mills located in Sacramento are to spend $250,000 for extensions during the next six months.

HARNESSING ELECTRICITY

The poultry farm is going to use more electric current in the future. It is to be harnessed to take the place of human muscle. The clover and root cutter, the grinder of grains, the grindstone, and other machines, will be hitched to the copper wire of the roadside. Already the wire is making possible better lighting of incubator cellar, brooder house and grain room, as well as extending the working hours of the flock in the poultry house. Some New York State folks seem to think that they can afford to light their poultry pens in the short days of winter, extending the hours in which the hens are able to eat and work, and get enough extra eggs to pay a profit.



Think What the *Tube* Has to Do

ALMOST everyone knows, now, that Goodyear Cords are the first choice of the race driver.

For all important track records, from one mile to six hundred miles, have been established by cars shod with Goodyear Tires.

But we wonder how many people realize that this fact is one of the most emphatic endorsements possible for Goodyear Tubes?

No tire, not even a Goodyear Cord, could stand the terrific punishment inflicted by scorching speed unless the tube which it enclosed was irreproachably made.

Goodyear Heavy Tourist Tubes are made of purest rubber—gray gum strips *built up layer-upon-layer* many plies thick, then welded inseparably together into an integral mass.

They are of even heavier construction than usually used in racing tires.

Because of their longer life and their unfailing retention of air, they undeniably do give much protection to casings.

This being true, isn't it essential that *your* tires have the benefit of the finest tubes you can buy?

More Goodyear Tubes are used than any other kind.

REMEMBER THE DATES AND BE SURE TO BE THERE

Cover Crops in Arizona

By M. E. Bemis

COVER crops in Arizona do not mean quite the same thing that they mean to California orchardists. Particularly is this true in relation to clean cultivation in the summer. It has been found by actual experiments that the temperature of the soil is several degrees less in summer where a crop is being grown,—consequently the practice of clean cultivation through the summer is being quite largely discontinued.

A few years ago it was rather common to see the citrus and olive groves clean cultivated and an occasional deciduous grove. This was but natural as many of the orchardists were from states where clean summer cultivation had been the rule and a desirable practice to follow.

During the past few years I have seen but very few groves that were kept cultivated clean through the summer. The crop which is grown as a summer cover crop varies almost as much as the variety of crops grown by the farmers throughout the Valley. In other words, we find in the young groves some truck or farm crops quite commonly grown. Usually this is some crop which requires clean cultivation. At the same time the crop which is grown helps to keep the temperature considerably lower than would otherwise be the case and to some extent protects the trunks of the small trees. As the trees come into bearing it is generally found that some crops which may be broadcasted are more commonly grown. In the citrus groves cow peas are popular summer cover crops. These make a dense growth, which when plowed under adds humus and nitrogen to the soil.

With many of the growers of deciduous fruits the natural weeds and grasses are frequently allowed to grow. This gives the appearance of neglect, and to one unacquainted with conditions the conclusion might be that it was slipshod farming. Results, however, seem to justify this practice and I should hesitate to criticize some of our successful fruit growers inasmuch as they succeed in producing a splendid quality of fruit year after year and in quantities that bring them splendid results. In quite a few groves alfalfa is grown. This is usually plowed up every four or five years and the grove thoroughly cultivated and cow peas or some other crop grown for a season or two.

Winter cover crops are not as common. In fact, with the practice of growing a summer crop such as cow peas or allowing grass and weeds to grow in the grove, the custom is to plow this growth under in the fall and cultivate more or less in the winter. Some citrus growers have tried growing the so-called sour clover (Melilotus Indica). This makes a heavy growth and is probably satisfactory as far as a winter crop is concerned. Sweet clover, so far as I know, has been grown here but very little, although in one instance that I know of it has proved to be a rank grower and would add a great deal of vegetable matter to the soil. Of course, where alfalfa is grown it is both a summer and a winter cover crop. Soy beans have been grown to some extent but so far they have not proved nearly as satisfactory as cow peas.

The San Carlos Project

EARLY Spanish explorers found the Arizona Indians farming in the Gila Valley, although their irrigation methods were more primitive, if you will excuse the paradox, than the irrigation systems of their prehistoric—shall we say ancestors or simply predecessors. The Casa Grande Valley takes its name from the ruins which the Spanish explorers called, for want of a better name, Casa Grande (big house). Through this great alluvial desert plain these prehistoric peoples had built canals, and evidences are conclusive that they must have at some time or another irrigated and tilled thousands of acres of this Casa Grande Valley, just as thousands of acres were once under cultivation in what is now the Salt River Valley. Early white settlers began irrigated farming in the vicinity of Florence before the first canal was taken out from the Salt River.

Engineers and old timers that had good sound sense have for years known that in the mountains beyond Florence through which the Gila has cut its way, there was an admirable site for a dam and storage reservoir, but the people of the Florence district and the Casa Grande settlers have been slow to get together on a proposition to build this dam. There were differences of opinion, such as have been many times the causes of disputes in the Southwest where there is more irrigable land than irrigation water. Even with a storage reservoir it will not be possible to irrigate all of the great valley of the Casa Grande. It is probable though that with some supplementary irrigation by pumping that there will be altogether a greater area that will eventually come under irrigation than in the Salt River Valley.

Recently the settlers in this valley got together on a plan for the building of a diversion dam above Sacaton on the Indian reservation. Through this plan the government insures water for the Indians of the Sacaton reservation, and the white settlers have water for several thousand acres. This was so much easier than anticipated and proved the value of cooperative effort so well that the people became enthusiastic and have decided to forget past differences and go after the big storage dam in the San Carlos or Box Canyon.

As a result of the efforts of these workers who are enthusiastically uniting to put over the big project, there was held at Florence a monster mass meeting for the purpose of crystallizing sentiment in favor of the project and beginning the work of actually bringing it about. The same committee of citizens that has successfully brought the diversion dam was elected to plan the campaign for the bigger project. Judge O. J. Braughn, superior court judge of Pinal County, is chairman.

The preliminary work is to get signatures from the owners of the lands to be benefited, and this seems now to be the easiest part of all, so enthusiastic are the settlers in the valley. It seems likely that many who will not be under the canals will get behind the movement, for it is now realized as never before that the indirect benefits will make it advantageous to those who have lands contiguous, but irrigated with pumps. Later the committee will prepare a brief for presentation to congress asking for federal aid. Whether this can be handled as part of the soldier settlement plan or not remains to be seen. The one thing that stands out now is that the people of Pinal County are together and have the enthusiastic backing of neighboring counties, and with such determination it will be possible to build by private enterprise if the government does not aid. The San Carlos dam must be built.

A DEMONSTRATION OF GRASSES

Every one visiting the tractor show will be interested in the remarkable demonstration of forage grasses and sorghums on West Sixteenth Street in the 1500 block, Los Angeles. Here you can see Napier, Merker, Rhodes and other grasses in comparison; also the Wonder Forage, Schrochs Kafir, Silver Tip and other sorghums and millets. To visit the plot is well worth your while.

APPLES MUST CONFORM TO STANDARD

The following instructions issued by Director Hecke will be rigorously enforced by inspectors througnout the state:

To Apple Dealers

Beginning Monday, July 28, only apples bearing the state standard stamp or conforming to the requirements of the 1917 standard apple act can be removed from transportation company terminals by the consignee. All others will be returned to the shipper or removed to a cold storage plant and held until shippers conform to the required grade and marking, after which apples will be delivered to original consignee with a statement of storage, transfer and repacking charges, if any, to be deducted from sales account to shipper. The law plainly states that the end of the boxes must bear the name and address of packer or shipper, the variety and grade of apples, net weight or number of apples in the box and the date packed. These simple requirements were intended to advertise California apples, facilitate handling in transportation and by the trade, and to protect all parties concerned. Neatly marked boxes lend to appearance and appearance adds to value.

ALMONDS MOVING

"Shipment of almonds started from Sacramento the first week in September and will continue for five months," says a letter from the Sacramento chamber of commerce. "The entire crop for 1919 has been contracted for. California's almond crop, which represents 98 per cent of the entire American yield, will be the greatest in the state's history this year, according to growers in the Sacramento Valley where 75 per cent of the state crop is produced. It is estimated that the 1919 crop will total 7,000 tons, or twice the volume of the crop in 1915. The value of this year's crop is placed at $3,000,000. The prices to be paid the growers will be the highest on record, it is predicted. Last year prices ranged from 20 to 25½ cents a pound and it is expected that the 1919 prices, to be set the first week in September, will be even higher.

CALIFORNIA A PEACH STATE

California is rapidly becoming the "greatest home in the world for peaches," according to a statement made at Riverside by Homer B. Fairchild, pomological expert with the department of agriculture, at Washington, D. C. "The peach crop of America this year will not be more than 30,000,0000 bushels," said Mr. Fairchild, "and of that amount California will produce 16,000,000 bushels. What with peach yellows and curly leaf, Delaware, Michigan, Ohio and parts of Indiana and New Jersey will not have a quarter of the crops they used to have, while California has an immense field and the demand is proportionately large. Every dollar California has spent vanquishing horticultural diseases and insect pests will return tenfold, and then some. In ten years the crop of Georgia has fallen from 4,200,000 to 2,700,000 bushels, all because of the yellows which have slowly sapped the life out of the trees. It is almost the same in Virginia. California is more nearly free of peach tree diseases than any other state in the Union."

TUOLUMNE HAS GOOD APPLE CROP

County Horticultural Commissioner Sherrard of Tuolumne says: "The apple crop is way above normal. Many growers have thinned out heavily and the trees are bearing to their capacity. Several growers received $75 per ton this year against $45 for 1918. Others are following the standardization law closely, grading and packing, and as a result are getting from $2.40 to $2.50 per box. Warm weather advanced the season about a week earlier this year."

PLANTING ALMONDS IN SAN LUIS COUNTY

Commissioner Alley of San Luis Obispo advises that G. A. Nehrhood of Paso Robles has placed orders for 276,000 trees for the coming season for himself and the Associated Almond Growers of Paso Robles. This is the biggest order so far this year for any county. It is made up of almonds, 70 per cent, prunes, 25 per cent, and the remaining five per cent mixed fruits

THE CALIFORNIA CHERRY

During the 1919 season California will ship to the markets of the world about 25,000 carloads of deciduous fresh fruits, and while the cherry shipments probably will not reach more than 275 carloads (fresh), this amount, with the canned cherry output, makes the cherry crop one of the most successful and remunerative crops of the state.

STATE DEPARTMENT OF AGRICULTURE ISSUES LEAFLETS

The state department of agriculture has ready for free distribution two leaflets: "Laws and Regulations pertaining to the Walnut Codling Moth," "Standards for California Certified Seed Potatoes." These may be had upon application to Director, Department of Agriculture, Sacramento.

FRUIT DEALERS FINED

Seven $50 fines were collected from fruit dealers of Oakland during the first two weeks of August by the Horticultural Commission's office. Fines were all imposed for violation of the standardization law in offering for sale fruit that was wormy or in deceptive pack.

AN EYE ON MEALY BUG AND RED SCALE

The quarantine division of the Los Angeles County horticultural commission is taking especial precautions to prevent introduction of mealy bug and red scale through nursery shipments into clean districts.

Citrophilus, the most difficult of the mealy bug species to control, is most often found on ornamental plants; the chief source of red scale infestations is citrus shipments. Sometimes no red scale can be found above the burlap on balled trees, but may be discovered an inch or so below the surface of the earth if it is loose. When they have attached themselves in this way, they may live through dipping or fumigation and will escape careless inspection.

SIX KINDS OF COOPERATION

Here are six kinds of rural cooperation advocated by a southeastern farmer:

1. Cooperative buying of supplies by the pooling of purchases.
2. Cooperation in producing crops by joint ownership of improved equipment.
3. Cooperation in putting raw products into more finished forms by joint ownership of gins, mills, creameries, etc.
4. Cooperation in the marketing of crops.
5. Cooperation in financing farm production.
6. Cooperation for more and better education of the kind which is really needed by the rural people.

Studebaker

THE 60-H. P. BIG-SIX

IN providing complete motoring satisfaction the New Seven-Passenger Studebaker BIG-SIX offers the utmost in individuality and charming appearance. Its 126-inch wheelbase insures perfectly balanced riding qualities and maximum comfort for every passenger. The 60-horsepower motor with its two-range carburetor and hot-spot intake manifold makes possible unusual speed and power under every driving condition.

Equipment includes *cord tires,* shock absorbers, tonneau extension light, oval plate glass windows in rear of Gypsy top, genuine hand-buffed leather upholstery, silver-faced jeweled 8-day clock and magnetic speedometer mounted on a circassian walnut-finished instrument board, and many other conveniences.

Studebaker quality, dominant for 68 years is reflected in this new BIG-SIX.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

That is no "ad" on the cover, though at first it may look it. It is a consideration of public interest and a looking toward the welfare of the producer that induces the implement men to stage a great event near Los Angeles next week. True, there is an enlightened self interest in this matter, for there will be many a tractor sold and many an improved farm implement sent to the ranch which will increase its productive power and advance the interests of agriculture. And the dealers will, everyone, reap profit and reward. So will the farmer. Hence the Cultivator is glad to give without cost to the association the entire first cover to the map calling attention to the location and announcing the great event.

Read the cover.

A JUST SENTENCE

A Chicago justice has a new penalty for auto speeders. When the usual Monday morning bunch came before him he withheld any fine or imprisonment for that particular day and sentenced the entire party to make a visit to the city morgue and to spend a few minutes in viewing the bodies of those who had been killed the preceding day by auto speeders. The coroner has found that this is proving a very satisfactory sentence in that it has reduced the number of deaths.

AIRPLANES EFFECTIVE

One feature of the state fair which attracted much attention was the exhibit of the United States forest service in the big new building. John D. Maxfield, of the San Francisco headquarters, was in charge, and when we asked as to one feature of the exhibit, a toy airplane constantly circling about, they assured us that real airplanes were doing far more than toy service. They have ceased to be playthings and their patrol over impassable mountain sections has given early warning of many a fire and saved the destruction of thousands of acres of timber.

BETTER ROADS NEEDED

The first remark made by the officers of the artillery companies which came 4,000 miles across continent with two 175 m.m. guns drawn by tractors, together with search lights, wireless instruments and other war machinery and camp equipment, was: "Give us better roads; they are needed for military, for industrial purposes; they are needed for the farmer."

The travel stained, dust covered company rolled into the state fair grounds and gave a real thrill to thousands of spectators for they looked the "real soldiers" which they are. They usually hastened to say, regarding the roads: "Since reaching the California line the roads have been the best we have encountered, but the country across there is woeful lack of road efficiency."

COOPERATION IS PROFITABLE

At the meeting of the California Holstein Breeders' Association at Sacramento, state fair week, President Kiesel, in making his annual address, referred to the success which is being given to dairymen of California. As one of the greatest factors in that success he gave credit to the California Milk Producers' Association, of which J. M. Henderson is president. This association has suffered from the fiercest of attacks by interests whose business has been affected by the success of the dairymen, but the loyalty of the members, at least the loyalty of by far the greatest proportion of them, has been such that the association is growing, is installing new creameries, factories or plants for the handling of dairy products. It is making butter, cheese, condensed milk, milk sugar, casein, powdered milk and malted milk.

It was reassuring to hear the endorsement given to President Kiesel's remark by the dairymen present.

STATE CONVENTION

Director Hecke of the state department of agriculture has called a meeting of fruit growers and others interested in the coming State Fruit Growers' Convention, to be held in Chico next Tuesday. This meeting will be simply for the arranging of the general plan and possibly some of the details of the coming great convention. Exact dates have not yet been chosen, but probably the convention will be held during the first week of November and in Chico, Butte County.

No convention yet held in the state was more important in its results than that held at Riverside a few months ago. We are not informed whether an effort will bo made to secure as great an attendance of Coast entomologists and horticulturists at the coming convention, but thore are burning questions of great interest to our fruit growers which will call a representative body together in Butte County. It has been years since one of the conventions was held so far north as this one, and growers in the southern part of the state should make an especial effort to attend.

FARM POWER PRICES

A more general use of farm power is being made every day. Events such as that of the coming week in Los Angeles give still greater impetus to farm power use. Labor is higher and less efficient, and the demand for greater production increases instead of diminishes with business. It seems the only solution is encouraging the still greater extension of the use of gas. The farmer is, however, questioning the advisability of buying anything at present prices, but if he will produce and secure the prices which are at present being paid for farm products he must produce at this time and not wait for the reduction which, when it comes, will certainly not be all on the side of the implements and machinery which he purchases. The question is discussed from every angle by almost every farm paper and the universal expression is: "We are making no predictions; it is possible there may be a lowering of prices, but the only correct procedure is to deal with the present and purchase as needed for greatest efficiency." If we were to give any advice at all it would be to use that which is needed and secure it at as reasonable a price as possible under present conditions.

QUARANTINE

Frederick Maskew says we are not the only ones who have entered into the quarantine business. He has done some little looking up in this matter of quarantine and finds that in the good old city of Venice on the Adriatic as far back as 1448 it was necessary to quarantine. Notwithstanding this early beginning of quarantine it was some hundreds of years before the countries of Europe settled down and worked out a safe, sane and consistent system of quarantine. This was in 1853, but it has taken nearly two-thirds of another century before the United States could get down to a consistent and regular working out of a plant quarantine plan. California and many other states have protected the interests of their agricultural classes by enacting and endorsing quarantine regulations, though it may be remarked that as early as 1700 Wm. Penn, sole owner and proprietor of Pennsylvania, made certain recommendations as to the transfer of pest infested products within his properties.

Those who were at the Riverside convention some months since and came in touch with C. L. Marlatt, chairman of the federal board of horticulture, are impressed with the fact that a most resourceful and capable man is at the head of this work in this country, and notwithstanding the determination of importers and others to nullify the action of this board and even to put it out of existence, will continuo to strengthen and perfect the work of the board. The organs of the importers seem to have caught many of the Eastern papers, for the Literary Digest recently made a bit of editorial comment before quoting the pros and cons of the question. In this editorial note it says: "Experts estimate, we are tóld, that thc loss caused by the pests already introduced, for the most part through the agency of imported plants, aggregates a half million dollars annually." Presumably this is an error which can be laid to the typesetter, for the sum intended must have been a half billion, for one pest alone, the pink bollworm of the cotton fields, has already caused in excess of $20,000,000 loss annually, and this is strictly an introduced pest. The state of Massachusetts has in one year appropriated $600,000 to fight the gypsy moth; the state of Texas, the pink worm, over a half million; the department of agriculture, a half million to devise means of controlling the European corn ear worm. The loss from this corn ear worm is about $15,000,000 annually. Unless our people awake and insist that importers and politicians keep their hands off, other millions, or possibly billions, of loss will be visited on agriculture.

CALIFORNIA AGRICULTURE

Another week we will give details regarding the personnel and the work of the recently organized department of agriculture for California. George H. Hecke, the former commissioner of horticulture, has been busy organizing the new department, and to the end that more efficient work may be secured is now arranging large offices which will bring under one roof the various departments which have been scattered from Sacramento to San Francisco. It is most reassuring to see the manner in which Director Hecke is taking hold of the work, and we believe he will have the fullest support not only of the horticulturists but of the live stock men and the farmers generally.

ANTELOPE FAIR

The Antelope Valley fair opens next Wednesday morning. It will not be as big as the state fair. It may not have the large attendance which probably will be given the tractor demonstration in Los Angeles, held the same week. But it is to be noted that the event is a milestone in the agricultural history of that valley. California is appreciating more each year the work of the local agricultural fair.

Success to the alfalfa palace and the entire show at Lancaster.

ARCADIAN
Sulphate of Ammonia

In a great many cases an application of ARCADIAN Sulphate of Ammonia now will help size the coming citrus crop in addition to prompting bud growth for next season.

ARCADIAN Sulphate of Ammonia is for sale by: CALIFORNIA: San Francisco; Hawaiian Fertilizer Co., Pacific Bone Coal & Fertilizing Co., Pacific Guano & Fertilizer Co., Western Meat Co., California Fertilizer Works. Los Angeles; Pacific Guano & Fertilizer Co., Pacific Bone Coal & Fertilizing Co., Agricultural Chemical Works, Hauser Packing Co. OREGON: North Portland: Union Meat Co.

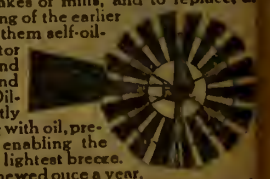
THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.



We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.
Write AERMOTOR CO., 2500 Twelfth St., Chicago

Bureau of Markets in Los Angele

By H. H. Warner

THE "Office of Markets and Rural Organization" as the bureau of markets of the United States department of agriculture was first called, was authorized by Congress in 1913. The scope of its work was rapidly extended until in January 1919 its agents were scattered in every food producing district of the country as well as in large centers of consumption. Originally designed to aid the farmers in the intelligent marketing of their crops, it rendered an exceedingly valuable service to the shippers and distributors of perishable foodstuffs as well as to the producers.

The emergency funds which became available to the bureau from the greatly increased appropriations during the period of the war were of particular benefit to the food administration in helping to control the food supply of the nation. These increased funds enabled it to enlarge its personnel and to rapidly expand two of its activities, the market news service on fruits and vegetables, and the food products inspection.

In the spring of 1918 market stations were opened for the first time west of the Rocky Moutains and the leased telegraph system extended to include Los Angeles, San Francisco, Portland, Seattle and Butte. In addition to these city offices, field stations were operated during the period of the crop movement in Brawley, Fresno, Turlock, Sacramento and in several districts in the Northwest.

Daily market news bulletins showing the prevailing price and the trade conditions in the large eastern cities were mailed upon aplication, free of charge, to all growers who were interested. For the first time producers of perishable crops on the Pacific Coast were given the same accurate knowledge of prices in consuming centers which Eastern farmers had enjoyed for several years. This nation-wide market reporting service has become famous for its authentic and reliable price reports because the men selected as market reporters had no axe to grind and were appointed because of their thorough training in this line of work.

The Los Angeles office was opened for business in May, 1918, and rapidly built up a large mailing list of several thousand growers who were quick to avail themselves of this free reporting service. In the first year of its operation market reports were issued daily in season covering potatoes, onions, cantaloupes, grapes, appies, peaches, pears, cabbage, cauliflower, lettuce, celery, tomatoes and spinach. Semi-weekly reports on dry beans and monthly reports on honey were also issued. Owing to the three hours difference in time between Los Angeles and the larger Eastern markets, these reports were usually completed and in the mails by noon of every day, showing the prevailing prices the same morning in the Eastern markets for these various crops. Nine employes, including two telegraph operators, were engaged in receiving, compiling and mimeographing this information every day in the Los Angeles office.

Although the increased appropriations due to war conditions also made possible the rapid expansion of the food products inspection service, this did not mean as much for Los Angeles because the law provided for the inspection of carloads of fruits and vegetables only at destination. Probably no city of equal size in the United States consumes as little "shipped-in" fruit and vegetables as Los Angeles. Consequently the inspection work was of minor importance here, and altogether only about 30 requests for inspections were received during the first year of operation. The certificates issued however were prima facie evidence in any court as to the actual quality and condition of the products examined, and while the food administration was in force these certificates were used as a basis for recommending adjustment in all disputes of this nature.

There has always been and still continues to be a strong demand from shippers for the same kind of inspection at the loading points. Should the bill which has been introduced providing for this become a law and carry with it a sufficient apropriation, the Los Angeles office of the bureau of markets would become one of the largest and most important in the country. It would require a big force of experienced men to inspect shipments at the originating points in Southern California. Shippers are insistent that they be given equal government protection with receivers on this matter, and they have repeatedly made strong demands upon their congressmen to see that the bill which has been introduced becomes a law.

The third line of activity in which the Los Angeles office was especially interested was in assisting where possible the organization of growers for the better marketing and distribution of their products. In this connection some efforts were made to show the pear growers in the Antelope Valley and the apple growers in the Yucaipa and Oak Glen districts the advantages to be gained from cooperative marketing. A number of districts like these are rapidly nearing the point of overproduction so far as the local market is concerned and should for their own future good begin to seek Eastern outlets.

The situation this past year in the Coachella Valley is typical of the condition which the local office tried to remedy. The onion growers of that district, because of being unwilling to work together in a marketing enterprise, sold their crops in advance of the harvest for little more than the cost of production. Contracts or options on the growing crops passed freely about from one speculative dealer to another on a steadily advancing market, and when the onions were finally shipped, several "clean-ups" were made by these operators. No one can be blamed except the growers who were short sighted enough to permit local jealousies to stand in the way of organizing their own marketing system.

Instances of this kind are commonly found among disorganized growers, and through the opportunities afforded by the county farm bureaus the Los Angeles office of the bureau of markets was able to present forcefully to the growers the necessity for closer cooperation.

The agricultural appropriation measure which carried funds for oper-

- keep down the up-keep with

VENTURA TRACTOR OIL

PARAFFIN-BASE oil resists heat and holds its "body" at high temperatures. It "stays put"—it sticks to the hot working parts of your tractor engine and protects them from wear.
That's why it is cheaper to use VENTURA paraffin-base Tractor Oil—you keep down the cost of keeping up your tractor. You save on repair bills, on new parts, on lost time.

VENTURA Tractor Oil is manufactured in different grades suitable for every make of tractor.

If you have any mechanical trouble with your tractor, let us help you. Our tractor experts are always at your service without cost or obligation on your part.

We solicit orders for barrel shipments anywhere. Use a home product—a Paraffin-Base Oil made in California.

Write for prices and for our free lubrication chart showing the proper grade of VENTURA OIL for your tractor.

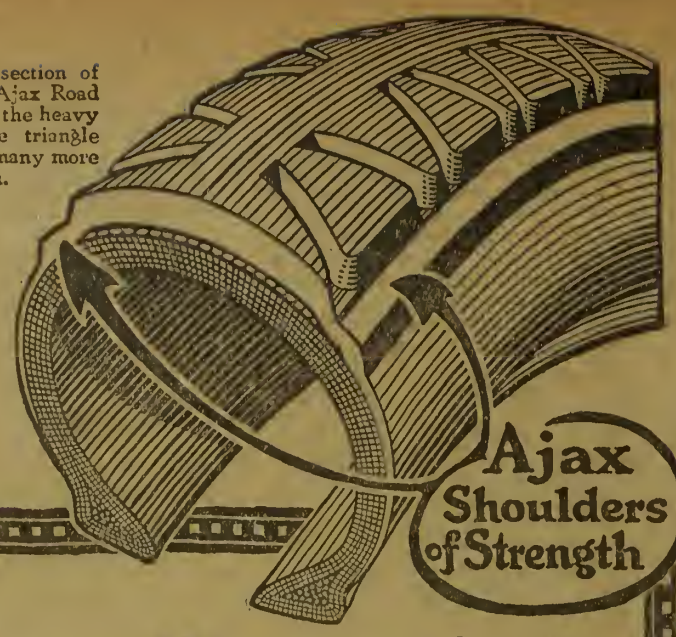
VENTURA REFINING COMPANY
Los Angeles
Branch at Colton, Cal.

This is a section of the famous Ajax Road King. Note the heavy tread. These triangle barbs mean many more miles for you.



More Strength
Where Strength Is Needed

These special patented Shoulders of Strength put greatest strength where the road strain comes. They are built in on both sides of the tread. They reinforce and distribute road friction evenly over the entire tread surface. Because of Ajax Shoulders of Strength, wear cannot center in one spot to grind quickly through to the fabric.

Champion of Champions

Because Ajax tires have more strength where strength is needed—because they have more rubber where it should be—they are the unanimous choice of the daredevil dirt track racers. 237 gruelling races were won on Ajax tires in 1917. State fairs from Massachusetts to Texas witnessed these Ajax triumphs. Countless thousands roared approval as Ajax swept the fields.

It is the strength and quality of Ajax tires that have made them 97% Owners' Choice. This huge percentage of Ajax annual output is chosen by individual buyers to replace other tires that came on their cars

Ajax tires are guaranteed, in writing, 5000 miles.

The new Ajax booklet, "Ajax Wins," tells the great story of Ajax racing triumphs. Write for a copy. It is free

You can save money by using Ajax tires and tubes. Look up the nearest Ajax dealer.

A WADE does 10 mens work
Saves 25 cords a day!

A money-maker and hard work saver for land clearers and wood-cutting contractors. One man can move it from cut to cut. Simple and reliable. Hundreds in use all over the U. S. When not in use for wood cutting, the 4 H. P. motor will run mills, feed mills, feed cutters, pumps, etc.

"My Wade saw is cutting wood for less than 3 cents a cord."—F. J. Williams, Burns, Ore.

"I have sawed through five foot solid oak logs at the rate of one foot a minute."—N. P. Myers, Laton, Calif.

Quick deliveries from over 100 points throughout the United States.

America must burn more wood for fuel. One Wade will do 10 men's work at one-tenth the cost. Write for free Book, "How Dan Ross cuts 40 cords a day," full details and special price.

Correct Tractor Lubrication

Correct lubrication adds much to the efficiency and life of the tractor, the truck or stationary farm power. The article following is written by a board of engineers employed by the Standard Oil Company and is used in the California Tractor and Implement exhibit catalog of the California State Fair. This catalog is not only a very complete list of tractors exhibited by the California Tractor and Implement Association, but is a general aid to the trouble shooter on tractor. We quote this article on lubrication entire.

IN ORDER to operate any piece of machinery it is necessary to interpose between all bearing surfaces a film of some lubricant—preferably an oil. The function of this lubricant is to adhere to and fill up the minute depressions in the bearing surfaces which it is called upon to lubricate, forming a film and acting as a cushion which absorbs the frictional heat generated and taking the wear instead of the metallic bearing surfaces themselves.

Friction is always present in any mechanism as a resisting force which tends to retard motion and bring all moving parts to a state of rest. It is estimated by engineers that in the internal combustion motor, such as is used on tractors, 20 per cent of the power developed in a correctly lubricated motor is used to overcome the friction of moving parts. This waste of power is, of course, largely increased where incorrect oils are used or where the lubricating system does not receive the proper attention by the operator.

Upon the correct lubrication of your tractor depends largely the power developed, consumption of fuel, and the expense of upkeep in repair, adjustment, and replacement of parts. It is, therefore, obvious that correct lubrication is of vital importance, and any effort made to bring about this highily desirable condition is directly beneficial in dollars and cents to the tractor operator.

It must always be remembered that in the internal combustion engine two lubricating problems present themselves: First, the lubrication of the close-fitting crankshaft bearings which operate under high temperatures; second, the lubrication of the wrist pins, pistons and cylinder walls which operate under high temperatures. As it is not possible to use an oil in your engine for each condition mentioned, the same oil must satisfactorily lubricate both bearings, pistons and cylinder walls under extremely varying conditions.

The correct oil for tractor engine lubrication must not have excessive body at normal temperatures in order to have sufficient body at high temperatures to correctly lubricate the wrist pins, pistons and cylinders.

Cylinder Lubrication

As cylinder lubrication is the first and most important feature, we will describe the action of the oil in your engine which is of the four cycle type.

Inlet Stroke—On previous exhaust stroke, oil was distributed on the cylinder walls and this lubricates the piston as it descends on the suction stroke, the connecting rod dipping into the oil at the bottom of the stroke.

Compression Stroke—Next, the film that has just lubricated the piston is not affected by the fresh charge of fuel and air entering the cylinder and, consequently, will not be injured as the piston goes upward and distributes an additional supply of oil on the cylinder wall, a new supply also being splashed on the lower part of the cylinder by the connecting rod.

Power Stroke—On the power stroke this film lubricates the piston. There is a film of oil on the cylinder walls above the piston, a portion of which, that is, the outer layer of layers, is burned off. This film is not entirely destroyed: first, because the duration of the power stroke is so short, and second, lubricating oil does not burn very easily or very fast. That portion of the film which is burned off is consumed with the fuel or held in suspension. That portion which is not exhausted with the products of combustion is deposited on the cylinder piston, valves, and spark plugs in the form of carbonaceous matter.

Exhaust Stroke—On this stroke a portion of oil film above the piston having been burned away, the piston returning distributes a new film on cylinder walls which lubricates the pistons and cylinders on this stroke.

Correct Oil for Cylinder Lubrication

The correct oil for cylinder lubrication should be fluid enough so that it will quickly penetrate the minute clearances between piston and cylinder wall. It must maintain a body under the high temperatures encountered which will not allow the piston and cylinder wall to come into metallic contact. It must not thin down to the point that an excessive amount of oil will be drawn by the piston into the combustion chamber. Its characteristics must be such that the portion of the oil which is burned will be consumed with the products of combustion or held in suspension and pass out through the exhaust.

Bearing Lubrication

Fluidity is the prime requisite of an oil for correct bearing lubrication; in other words, it must be fluid at the temperatures at which it is used. The correct oil, among other things, must have a low cold test, that is, it should flow readily at low temperatures.

Where too heavy oils, or oils of poor cold test are used, they can not be readily splashed to the wrist pins and cylinder walls until the motor has been run for a sufficient length of time (which may be 15 or 30 minutes or longer), so that the heat of the engine has thinned the body of the oil down to the proper degree of fluidity. During this time, excessive friction is taking place, which not only causes a loss of power and increased consumption of fuel, but manifests itself in a sluggish, unresponsive engine and excessive wear of all bearing surfaces. The bearing farthest removed from the source of supply is the wrist pin which is lubricated by the spray or splash thrown from the connecting rod. It is therefore vitally important that the body of the oil in the splash pit be light enough so that when the connecting rod strikes it, it will readily be thrown to the wrist pins as well as the cylinder walls and pistons. With heavy-bodied, sluggish, or oils of poor cold test, this is not possible.

An oil is too light for bearing lubrication when the pressure on the bearings will force the oil out from between them and allow these parts to come partially or wholly into metallic contact.

If an oil is used which is very thick or sluggish at low temperatures, the power required to shear the oil film is excessive, which means increased fuel consumption, loss of power and undue wear of all rubbing surfaces.

Efficiency in engine lubrication, therefore, means that the correct oil in both body and quality must be used; it must reach the working parts of the engine in a clean, efficient condition, and it must be fed to the cylinders in correct quantities, otherwise one of two things will happen—over or underfeeding.

Overfeeding

Overfeeding means that more oil will pass the piston rings than can be consumed and expelled through the exhaust, which results not only in lessening the value of the explosive mixture, causing loss of power, but also in excessive carbon formation, together with excessive oil consumption.

Carbon Deposits

Carbon deposit in a gas engine is residue from incomplete combustion of hydrocrabon products. In an internal combustion engine the hydrocarbons are the fuel and the lubricating oil. There is also present a certain amount of silica which enters the cylinders through the air valve of the carburetor in the form of road dust, and a small quantity of oxide of iron due to wear is frequently present.

The first and most important consideration is the combustion of the fuel, for from this source the largest proportion of carbon is deposited.

Explosive Mixture

When the charge of fuel and air (the proportions of which are determ

ined by the carburetor adjustment) is taken into the cylinder of a gas engine, it consists of hydrocarbon vapor and air. The oxygon in the air mixes with the carbon and hydrogen of the fuel and forms an explosive mixture. This mixture is fired and the products of combustion are expelled from the cylinder through the exhaust valve.

Rich Mixture

If the amount of air entering the carburetor is not sufficient to insure complete combustion, we have what is known as too rich a mixture. This is a slow-burning mixture rather than an explosive one, and will cause excessive carbon deposit.

For example, if the wick of an oil-burning lamp is turned too high, too much oil will be siphoned through the wick for the amount of air entering the lamp to form complete combustion. The lamp will smoke, and soot, which is carbon, will be deposited on the chimney. This is exactly what happens in the cylinders of a gas engine.

Rich Mixture Causes Carbon

The products of incomplete combustion of the fuel, together with a portion of lubricating oil passing by the piston rings, deposits a certain amount of carbon in the combustion chamber. That portion of this carbon which does not pass out with the products of combustion is baked on the cylinder heads, pistons and valves by the heat of the explosion. This carbon deposit will build up very much more quickly if it has a bed to build up on, such as would be produced by a poor lubricating oil which leaves a gummy deposit when exposed to the heat of explosion.

It is necessary, in addition to carburetor adjustment, to be absolutely sure there is no obstruction in the exhaust passage of the muffler, which would set up an excessive back pressure. The ignition should take place at the correct point. If the engine is operated with an overretarded spark, ignition takes place too late, and the explosive mixture, even if it were correctly proportioned, would not have time to burn up cleanly. This would cause excessive carbon deposit and overheating.

The gas engine operator and mechanic usually figure that carbon is caused always by the lubricating oil. This is not true. If the correct oil is used in correct quantities, it will burn up cleanly and pass out of the cylinders, leaving no perceptible deposit of carbon.

It is highly important that a minimum amount of lubricating oil be allowed to pass by the piston rings. To insure this the cylinder, piston and piston rings must be in good mechanical condition; otherwise the amount of lubricating oil passing by the piston rings will be excessive. This will not only impair the value of the mixture, causing loss of power, but will leave excessive carbon deposits.

Lubricating oil adds materially to the carbon deposits of the internal combustion engine if the following conditions exist:

Poorly-fitting piston rings or scored piston rings and cylinders.

Carrying too high an oil level; using an oil that is not suited to the engine, both as regards body and quality, or carrying the pressure in a force-feed system at too high a point.

Allowing the oil in the crankcase or oiling system to deteriorate to the point that it is so thin that even a well-fitting piston ring will not prevent a surplus of oil from passing into the combustion chamber.

Underfeeding

Underfeeding means that too little oil is fed to insure correct lubrication. The result will be excess friction, causing overheating, excessive wear of all moving parts, and possible scoring of cylinders, pistons and piston rings, necessitating frequent adjustments and expensive repairs.

The efficiency of the internal combustion engine is dependent upon the amount of work derived from the heat generated by the explosion of the fuel vapor.

(To be Continued Next Week)

O. W. McKay of Eager, Arizona, claims to have treated locoed steers and horses successfully with ¼ grain doses of strychnine daily for 12 days and ½ grain doses thereafter for a period not stated.

Foreign Exchange

MANY of us are not sufficiently informed to get fullest information from some of the financial reports in daily or financial papers. One point, that of foreign exchange, is quite fully explained in the last monthly financial report of the Oakland Bank of Savings. We are inclined to think that this financial review was written by J. R. Garthwaite, for a long time grower of lemons at Corona, Riverside County. The circular says:

"The term 'foreign exchange' seems cloaked in mystery, yet while its ramifications are intricato its initial significance is simple. If a merchant in Berlin buys wheat in New York to the amount of $10,000, he must pay for it in U. S. dollars. He goes to his local banker and buys a draft on New York for $10,000, paying for it in German marks. Before the war a mark was worth about 24 cents in our money and a draft on New York for $10,000 could be bought for, say, 40,000 marks. Today a mark is worth about six cents and a Berlin draft on New York for $10,000 would cost about 160,000 marks. In other words, the disrupted condition of foreign exchange costs this Berlin merchant 120,000 marks.

"This is what is meant when the financial journals say the 'foreign exchange situation is very bad.' It is very bad and it will not be remedied easily or soon. We have mentioned the German exchange rate because it is extreme and illustrates the situation clearly. It is quite evident that the rate of exchange even if it were the only obstacle, would in itself be a potent barrier in preventing Germany from buying here. In less degree this is true of England, France, Italy, Belgium and most other European countries.

"The causes are: the acute necessity for food, raw materials and machinery vital to the resumption of their industry and trade, the fact that they have at present neither money nor goods which they can send us in exchange and, more than all, currency inflation. In consequence of these various causes, the tendency in those countries is to buy from us as little as possible and to sell us all they can. Thus we find London comparatively calm over the exchange situation as it compels rigid economy, stimulates exports, shuts out imports and hastens the solution of its own financial difficulties.

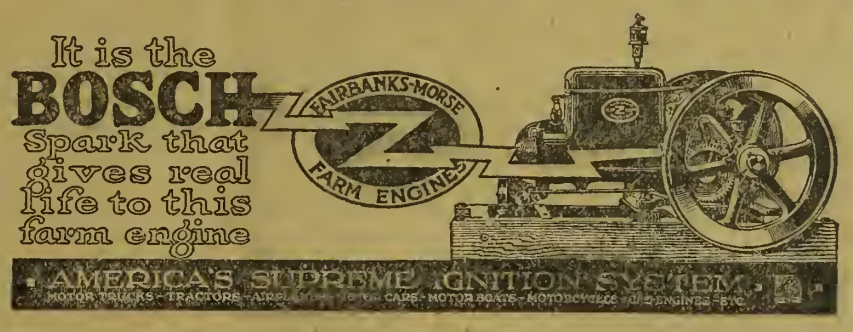
"The following table shows current rates of exchange early in August compared with par:

		Par	Present Rate	Disc. Pct.
Germany	Mark	.2382	.0725	70
Italy	Lire	.1930	.1168	39
Belgium	Francs	.1930	.1360	29½
France	Francs	.1930	.1392	28
England	Pounds	4.8665	4.3650	10
Switzerland	Francs	.1930	.1785	7¼
Holland	Florin	.4020	.3775	6
Denmark	Kroner	.2680	.2225	17
Norway	Kroner	.2680	.2375	11
Sweden	Kroner	.2680	.2475	7.6

"The extent to which these declines are attributable to inflation cannot be definitely measured, but it is certain that the greatest decline occurs where there has been the greatest inflation. The German Imperial Bank's note issue in August, 1914, was about two billion marks. In five years the amount of the note issue has risen to about 26 billion marks, and with the fall in the value of the mark to about one-fourth of its previous value, the price of commodities has proportionately risen.

"The problem is so complex that no simple or immediate solution is possible. Restoration of inflated currencies to something like normal conditions will take years of readjustment. Restoration of comparatively normal trade and industrial conditions will go far towards stablizing foreign exchange, and this is possible of early accomplishment. Europe is in dire need of almost every commodity of which we have a surplus, and unless we provide a way for her to buy she will starve while our abundant sup-

Announcement



Largest Magneto order goes to Bosch
Fairbanks-Morse "Z" engine
Bosch High Tension Magneto Equipt

IN the thirty-fourth year of its successful manufacture of dependable gas engines, Fairbanks, Morse & Co., after conducting the most complete investigation of ignition systems, has decided to equip its famous "Z" engines with America's Supreme Ignition System—the Bosch High Tension Magneto. Thus, the products of two internationally famous organizations—Fairbanks, Morse & Co., engine builders, and the American Bosch Magneto Corporation, magneto makers, combine to make a really great farm engine—an engine whose quality, dependability, and efficiency have no superior. The reason that prompted Fairbanks, Morse & Co. to specify Bosch—the highest priced and highest quality Ignition System made—on their most important product, applies equally directly to your ignition problems on your car, truck or tractor.

Powerful on Soft Ground

The twin crawlers of the Bates Steel Mule lay a firm runway on the soft ground which runway is held from slipping by twenty-four cleats. This runway has a ground pressure of less than 3½ pounds per square inch and being geared to it, the tractor pulls as big a load on soft ground as it can on firm footing.

The absence of slipping is one of the many factors that go to make the Bates Steel Mule unusually economical in fuel. This feature, combined with the unit construction; Timken roller bearings; hardened cut gears running in oil; and heavy-duty valve-in-head kerosene motor, contributes to the great efficiency of this tractor.

Built of steel and fitted with large Timkan and Hyatt Roller bearings throughout.

In all tractor demonstrations on hard and soft soil the Bates Steel Mule has attracted interested crowds and this year the new Model D promises to excel former demonstration performances.

Don't fail to see the New Model D Bates Steel Mule at Los Angeles Sept. 16 to 21, 1919.

FORD OWNERS! Try "FOR-DO" 10 DAYS FREE!

Works wonders on Ford cars. Gives engine more power, more "pep," more speed. Gives 4 to 6 miles more per gallon. Enables you to locate engine trouble instantly. Overcomes all spark plug troubles. Doubles life and service of plugs. Makes old, cracked or worn out plugs spark like new. More than 50,000 put on Ford cars in last three months. Let us send one for you to try 10 days free on your Ford.

Send No Money! Just send us your name and address, and we will send you "For-do" complete, postpaid, ready to attach. You can put it on in 3 minutes. No changes necessary in car or engine, no holes to bore, easier to put on than plugs. Use "For-do" 10 days Free. If you find it does everything we claim, and you want to keep it, send only $3. If you are not pleased, just say so—mail it back and no charge will be made. We take all the risk. Send today.

G. E. COLBY CO., Inc., 28 N. 8th Ave., Maywood, Ill.

plies rot on our hands. To provide an adequate credit system for her is one of our gravest problems. It is not only a humane duty, but a commercial necessity. It is another of the many vital steps toward saving civilization from Bolshevism.

"If such a scheme, sufficiently comprehensive, elastic and safe, can be devised Europe can proceed to rehabilitate itself, and a long step will have been taken toward peace in the economic world. Most strenuous efforts have been made by the bankers of the United States in this direction, but the bankers alone are unable to cope with it. They need the cooperation of every element in the nation; of industry, of trade and of the government, and it is to be regretted that so far these efforts have met with indifferent support. It is a national as well as international problem and may require a national campaign, possibly on the plan of our Liberty Loan campaigns, to get the desired result.

"An international conference which has been called by the Chamber of Commerce of the United States to discuss the subject will meet at Atlantic City on October 5. As the principal European nations will send representatives, it will be a notable convention and should make an effective beginning."

STATE FAIR

Continued from Page 327

plaza in front of the new $300,000 horticultural building, and the entire scene is one of surprising activity. Our imagination is whetted to the keenest edge; we are eager for the sights, which means that we are eager to see what man, in the genius of his efforts and the labors of his factory has wrought for our edification.

To the left is the automobile tent. A tour through its highways and bypaths reveals a most splendid sight in artistic development in automobile manufacturing. Cars are there in all sizes, all colors and all makes. From the little popular four cylinder touring model to the big $5.000 machine they are all there in their several gradations of size and cost. A Curtiss biplane occupied a prominent place in the auto tent. Its cost was $3,250 and the statement accompanied the plane that the purchaser would be given a ride home after the fair.

But we want immediately to enter into the really practical exhibits of the fair, and we will move over to the two mammoth tents which house the very complete display of the California Tractor and Implement Association. We can review but briefly some of the tractors and trust to the reader's imagination to form a conception of the entire exhibit.

The Lauson tractor we found arranged in a quite satisfactory manner for complete examination. Running parts were entirely exposed. A special feature of this tractor is the filtering attachment which clarifies the air before it enters the mixing chamber. This obviates the possibility of dust and dirt collecting in the carburetor and may prevent serious cost and expensive delays.

The new Four Drive tractor was shown to Californians for the first time. It is constructed with a worm gear on the rear axle and crome nickel bevel gears on the front axle. The wheel base is seven feet and two inches, width five feet and nine inches, and it will turn in a fifteen foot circle. As its name implies, the power is delivered to all four wheels, each wheel carrying its full share of the weight.

The Yuba Manufacturing Company showed a new adaptation of their 20-35 model. It has a larger motor, giving 22 per cent more power, and is designed for work in beet and hop fields. Extension treads are fitted for work in soft ground or in the rice fields. Their two smaller models completed a very practical exhibit.

The Stockton tractor is another new comer. It has a length of 96 inches, width 42 inches, height 52 inches and weighs 3,150 pounds. It is a light, sturdy and simply constructed farm tractor and should prove quite popular with the average California farmer.

Occupying a prominent place in the center of the tent was the full line of Avery tractors from the mammoth 40-80 down to the baby of the bunch, the little 5-10 model which retails at $775. This latter is a very practical and serviceable model that will use kerosene as well as gasoline, making it very economical. Its wheel base is 78 inches and the weight 2,600 pounds.

One of the most attractive displays was that of the Holt Manufacturing Company. Their big 75 was shown with all parts exposed, and the big machinery was propelled by motor power. A competent instructor gave full details covering the various working parts and the proper method of successful manipulation. Accompanying the tractor was their combined harvester and the mammoth land leveler.

After two years and thousands of dollars were spent in designing and perfecting the Victory tractor it was placed before the interested public with the assurance of simplicity, reliability and efficiency. This tractor had its initial baptism of critical analysis at the hands of prospective tractor buyers, who viewed it with keen interest at this year's state fair. It is light in weight but possesses reserve power; it is the 9-18 size, two wheel drive with a single guide wheel.

The All Work tractor is another of the several new machines that were shown for the first time this season. It is built especially for orchard work but has an abundance of belt power. It is 12-22, has a heavy duty four cylinder, 4x6 kerosene motor, a wheel base of 75 inches and weighs 4,500 pounds. The frame is of channel steel construction, reinforced with steel angles in all corners and hot riveted.

The Bean Track Pull tractor, as its name implies, pulls its single center track which is the same type as a roller chain. It rolls easily and does away with the necessity of oil in track lubrication. The rollers run on antifriction bearings; the transmission is oil tight and no power is wasted. It is of the 6-10 type, with a speed of two miles per hour and a gear ratio of 45 to 1. It weighs 3,200 pounds and has a length over all of 102 inches.

The new Monarch 8-16 is a popular small type tractor very similar to the original 18-30 and is especially adapted to orchard and vineyard work. The main working parts are straddle of the two track layer wheels which gives great steadiness to the machine.

The Waterloo Boy, a product of the John Deere factory, is a 12-25 model. It has a speed of 400 to 750 revolutions a minute and a pully 14x8 inches. The twin cylinders are cast in bloc and surrounded by large water jackets. The wheel base is 90 inches.

One of the most out-of-the-ordinary tractors shown at the state fair was the Linn. It is a combination of a truck and tractor, a kind of half truck, half tractor. A spacious load carrying platform fits over the track layer wheels and the front has the appearance of being a very sturdy truck. The front wheels are regulation truck wheels; the hood and radiator are similar to those on a truck and the cab affords a comfortable seat for the driver. The tractor is designed for hauling great weights as a regular load, while it will at the same time serve as a powerful draw.

The new 12-20 Twin City embodies many modern tractor features. It is the latest addition to the Twin City line and meets the demand for a three plow tractor with plenty of surplus power. Among its features are the center balanced crank shaft, the removable cylinder head, removable cylinder walls and the ability to move the engine forward, leaving the clutch exposed for easy adjustment and repairs.

We cannot attempt to enumerate and describe all of the tractors that were shown at the state fair, for the number was greater than was ever placed on exhibition in the West, and the surprising feature was the number of entirely new tractors. As an educational feature the tractor exhibit takes high rank, for a careful study of the models and the explanations of the attendants placed one in a favorable position to comprehend the purpose of the tractor and to know its possibilities and its limitations.

As being co-workers with tractors, plows found a ready place in the tractor tent. Conspicuous among the showing was that of the Knapp Plow Works of San Jose. Their plows are made for the heaviest class of work and are particularly serviceable where deep plowing is required.

The Killefer Manufacturing Company was on hand with their mam-

moth deep sub-soil plow. It is of heavy steel construction, with main plates one inch thick and six inches broad. Only the heaviest and strongest tractors can pull it, for it plows several feet under ground.

But we must hasten along to review

Other Commercial Features

Occupying a conspicuous place in the tractor tent was the Rotary grain cleaner. It works upon an entirely different principle from the ordinary and old fashioned fanning mill. Its compelling feature is the operation of paralell vibrating wire screens, by which all kinds of seeds, including wheat, barley, oats and kafir corn are cleaned thoroughly and quickly. It is the only machine that will thoroughly clean water grass from rice. In fact it has been a revelation to rice men by solving the rice cleaning problem. The cleaner is operated by a one horse power engine and has a capacity of 30 sacks an hour.

In the dairy section the predominating feature was the exhibition of various types of milking machines. The alternating action of the new De Laval milker causes milk to be drawn from the two front teats, while the two rear teats are given a brief rest period and the rear reservoirs are filled. The next moment the rear reservoirs are emptied by the application of suction to the two rear teats and the front reservoirs are being filled. In this way an even and continuous flow of milk is drawn from the udder. The even, alternating action of the udder pulsator is as regular as the power running the Pulso pump and cannot be interfered with by the operator. While the action of the pulsator and teat cups is positive and snappy, it is also uniform, gentle and pleasing to the cow. Besides the new milking machine the exhibit contained a full line of dairy supplies, barn equipment, Alamo engines and Acme feed cutters.

The Universal Milking Machine was shown by the California Hydraulic Engineering and Supply Company of San Francisco. The greatest advantage which the Universal has is the alternating pulsator. This is a three movement vacuum engine without mechanical complications and with nothing to get out of order. This device enables the machine to milk two teats alternately, thus closely approximating the natural way of milking. It gives an even, steady running motion and requires less vacuum and therefore less power. The rubber inflation expands and contracts with each stroke of the piston in the pulsator.

In the large booth of the above company was also a full line of their sanitary barn equipment, Duro pressure water systems, Alamo farm lighting plants and the famous American pumps.

The Calf Way milker is the embodiment of a distinct and patented principle. It seeks to imitate the action of the calf in drawing milk. Aside from the natural suction which the calf exerts, he also by the tongue closes the upper part of the teat and presses the milk out. The Calf Way performs this service. The top part of the cup closes first and the closing gradually proceeds downward until the milk is entirely drawn out. It is also similar to the action of the human hand.

In the main hall of the new horticultural building we observed in one of the booths the results of the application of bacteria as furnished by the Western Soil Bacteria Company of San Francisco. Sodium, silicon and aluminum are found in plants, but not considered essential to successful growth. When all conditions favorable to the best growth of plants have been furnished, with the exception that some one essential element is supplied only to a limited extent, the plants never develop beyond the point made possible by the element which was limited in supply. Applying this principle to crop production, it means no matter how favorable the water supply, the tilth or the other essential elements, the harvest will never exceed the limitations of the element least available in amount required of it. In the western states it is generally admitted that the plant food that is most generally the limiting factor is nitrogen, caused by our long, hot summers, as well as by leaching and washing. If nitrogen is the limiting factor bacteria will take it from the air above your ranch and deposit it in your soil.

In the comparison which comprised a large part of the exhibit, the beneficial effects were clearly shown. Alfalfa, oats, sweet clover and other plants showed wonderful growth when aided by nitrogen gathering bacteria

Every farm home and every barn and outhouse may profitably and economically be lighted by electricity through the various lighting systems that are available. The Delco exhibit was most complete in every detail. The system consists of an engine, generator and switch board built as a compact unit, and this unit, with the addition of the storage battery, comprises the complete equipment. The engine runs on kerosene, gas or gasoline. The electricity is used only from the storage battery and the engine is run only to recharge the batteries. In this way there is given a 24 hour electric service which may be made available in all parts of the house and out-buildings. The power may also be used for running the washing machine, cream separator, sewing machine, electric iron, carpet sweeper, in fact it will run any device that can be attached to the ordinary electric supply.

When our readers consider that we have been able to enumerate only a very small portion of the valuable commercial features of the state fair they will readily appreciate what a fund of information, of advancement, of progress and of improvement may be gained by a visit to that annual state show.

TUT! TUT!

"Oh! be not hasty, friend," I cried.
"Think twice o'er all you utter."
"I'm bound to do so," he replied,
"Because I stut-tut-tutter!"—Cartoons Magazine.

Daily reports on road conditions are now made a regular part of the service of the weather bureau in several of the states. The bureau expects to extend this service as rapidly as possible to other sections.

FREE

$3000 BOOK OF BARN PLANS

Going to build or remodel a barn? Then send for this book. 112 pages of the most practical barn plans ever published. Treats every phase of modern barn construction. Cost over $3,000 to compile. Yours free—for the asking.

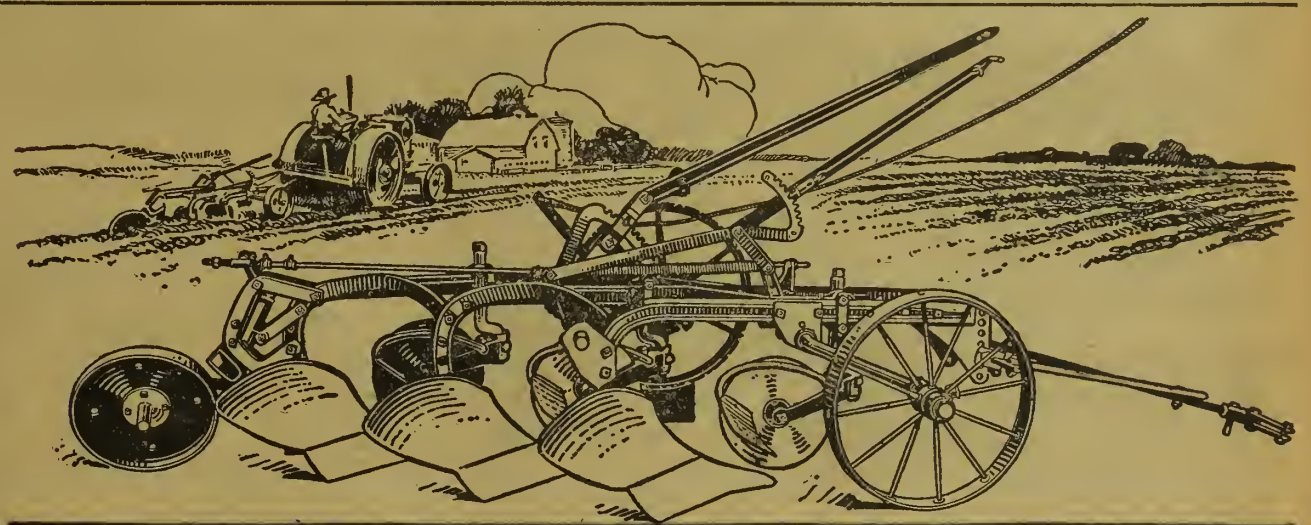
AND WE WILL ALSO SEND YOU THE COMPLETE LOUDEN CATALOG of modern sanitary barn equipment. Send for these two valuable books today.

LOUDEN BALANCE GRAPPLE HAY FORK

Lifts an enormous load. Binds it tight. Drops it clean. Spreads it well in the mow. Leaves no litterings to be cleaned up with a pitchfork. Three or four fork-fulls clear the rack. PERFECTLY BALANCED, slender but strong, will not bend or break. A money-saver in haying time.

AMERICAN PUMP CO.

73 Fremont St. SAN FRANCISCO
Dept. B, 420 East Third St. LOS ANGELES



When You Choose Your Tractor Plow

USE the same good judgment that you have always used in choosing your horse-drawn plows. Don't let the prospect of using a tractor make you forget the importance of the plow. Your tractor will only pull. It will merely take the place of horses. The direct work of making the seed bed will still be up to the plow. And making good seed beds is what you're after. Make sure of especially satisfactory work behind your tractor by choosing a

JOHN DEERE TRACTOR PLOW

Remember—
John Deere Tractor Plows are backed by 82 years of successful experience in plow-making. They are built to maintain and increase the reputation for good work and long life that John Deere Plows have established among farmers everywhere.

Sizes
Two-Bottom
Three-Bottom
Four-Bottom

Equipped With Genuine John Deere Bottoms—The kind that has an established world-wide reputation for long wear, good scouring and thorough seedbed making. You can get the shape and type suited to your soil.

Holds to Its Work at Uniform Depth—It is locked into the ground at plowing depth through the action of the power lift. The land wheel is set back, balancing the weight of the plow over all three wheels, just as on your sulky or gang plow. Makes plow run steady and assures plowing at uniform depth in uneven ground.

Quick Detachable Shares—Strong and close fitting. Loosen one nut to remove the share. Tighten the same nut and the share is on tight. It *stays tight.*

Extra Strong Construction—Extra heavy beams of special John Deere steel. We guarantee them not to bend or break. Heavy beam braces, long lapped and securely joined to beam with heavy bolts and lock washers.

High and Level Power Lift—Lifting mechanism is simple, strong and positive. Parts move only when plow is being lifted or lowered—practically no wear.

Three Sizes—Two-bottom, three-bottom and four-bottom. One of the sizes suits your tractor. And, remember, the adjustable hitch adapts the plow for use with any standard tractor.

Farmers Everywhere are making sure of continued good plow service behind their tractor by getting John Deere Tractor Plows. You can't afford to get less than that behind your tractor. See these plows at your John Deere dealer's store. We will be glad to send you a folder describing them. Ask for folder TP-34.

GET QUALITY AND SERVICE — JOHN DEERE DEALERS GIVE BOTH

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mati replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Second Mortgage

I am selling land to my neighbor who is to pay me one-half cash and the balance upon a mortgage. To make the cash payment he gives a first mortgage to a third party on my land as well as 20 acres of his land, and gives me a second mortgage on the same land. The second mortgage is to be paid in annual installments so that the last payment will be due at the time the first mortgage becomes due. Do I need any additional contract to secure my deferred payments? —Subscriber, Blythe.

A second mortgage may be drawn so that there would be no necessity of any further documents. The inquirer should understand, however, that if the second mortgage is properly drawn, upon the default of the payment of any installment, he would be entitled to foreclose; upon such foreclosure his land would of course be subject to the payment of the first mortgage.

Changing Name

Can one change his name legally, and if so how does he go about it and what does it cost? — Subscriber, Crockett.

Change of name is made by a petition filed in the superior court stating the place of birth, the residence of the petitioner, the present name, the name proposed, the reason for such change and the names of the father and near relatives and their place of residence. Upon the filing of petition the court issues an order directing all persons interested to appear at the time and the place specified and copy of this order must be published for four successive weeks in the newspapers. On the hearing the court may examine petitioner and such other persons and make the order to change the name or dismiss the application. In case the court orders the change of name a certified copy of this decree must be entered within 30 days in the office of the secretary of state. The costs would probably be in the neighborhood of $50 to $75.

Water Right

A stream of water which flows through my land has been used by me for irrigation, watering stock and domestic use for over 20 years. Pumping plants above are now drawing the stream so that I have no use of the water for periods of ten days at a time. Can I be deprived of this water? What recourse have I? — Subscriber, Ballard.

From the statement of the case, you apparently have a riparian right to this water which has been ripened into actual right by appropriation and use. It would therefore seem that your right is superior to that of those who are depriving you of the water, which would entitle you to maintain an action for injunction restraining the owners of these pumping plants from depriving you of the water which you are accustomed to have.

AERIAL FIRE PARTOL EXTENDED

The airplane forest fire patrol conducted in the national forests of California by the army air service in cooperation with the forest service of the United States department of agriculture has been extended to cover a portion of the forests in Oregon. Headquarters have been established at Salem, and the operating squadron for the present will consist of five officers and seven enlisted men operating eight airplanes. The city of Portland has donated a landing field and will construct a hangar. Patrol routes in the Oregon and Santiam forests are now being worked out.

One of the army aviators in the fire patrol work recently made a successful flight to the floor of the Yosemite Valley. To make a landing he had to gain an altitude of 11,000 feet and spiral down between the walls of the canyon which are 5000 feet high and a quarter of a mile apart. The landing was difficult because of high trees and wires. This exploit was of much interest to forest officers, as it is thought to have been a step toward the more extended use of airplanes in the forests, where landing places in the mountains are comparatively few.

PRODUCER TO CONSUMER

We have circular issued by the Quaker Farm Company at Alpine, San Diego County, in which suggestion is made of parcel post delivery to any part of the United States of pound boxes of shelled almonds, dried figs, and raisins. In this circular, which they send to prospective consumers, they say: "We place these delicacies in the hands of the consumers direct from our farms, saving dealer's profits in every case. These goods are excellent for use in cooking and baking, Christmas dinners, New Years, or any other day." Accompanying this is another circular, or rather leaflet, of recipes. It ought to lead to big business in a small way. Tasty packages with always dependable goods should place such a business on a permanent basis.

PAPER FROM COTTON HULLS

As a result of experiments conducted by the forest products laboratory United States department of agriculture, a good grade of paper is being produced in commercial quantities from cotton hull fiber. Pulp made from second-cut cotton linters and hull fiber, the forest specialists say, is well suited for the manufacture of book, writing, printing, blotting, cover, and other high grades of paper, and is equal in quality to the highest grades of paper stock.

Book Review

FARMERS' CLEAN MILK BOOK

"Farmers' Clean Milk Book," by Charles Edward North, published by John Wiley & Sons, New York.

It is not a very big book but is full of interest for the dairyman in these times of active demand on the part of the consumer. We quote from the preface as follows:

"This book shows why some milk contains millions of bacteria and how they get into it, and how easy it is to keep them out. It shows that the millionaire with his fancy barn has no monopoly on cleanliness, but that any farmer can produce milk which is just as clean as certified milk. It shows that the man himself is far more important than the dairy score card and that hundreds of farmers in many dairy districts are now making a business success of producing clean milk."

There are 132 pages, 26 chapters and many illustrations. Several chapters touch upon such subjects as Selling Milk; Bacteria; Bacterial Test; Milk in Udder; Cow Stable; Equipment; Clean Milking, etc.

BULKING THE GRAIN

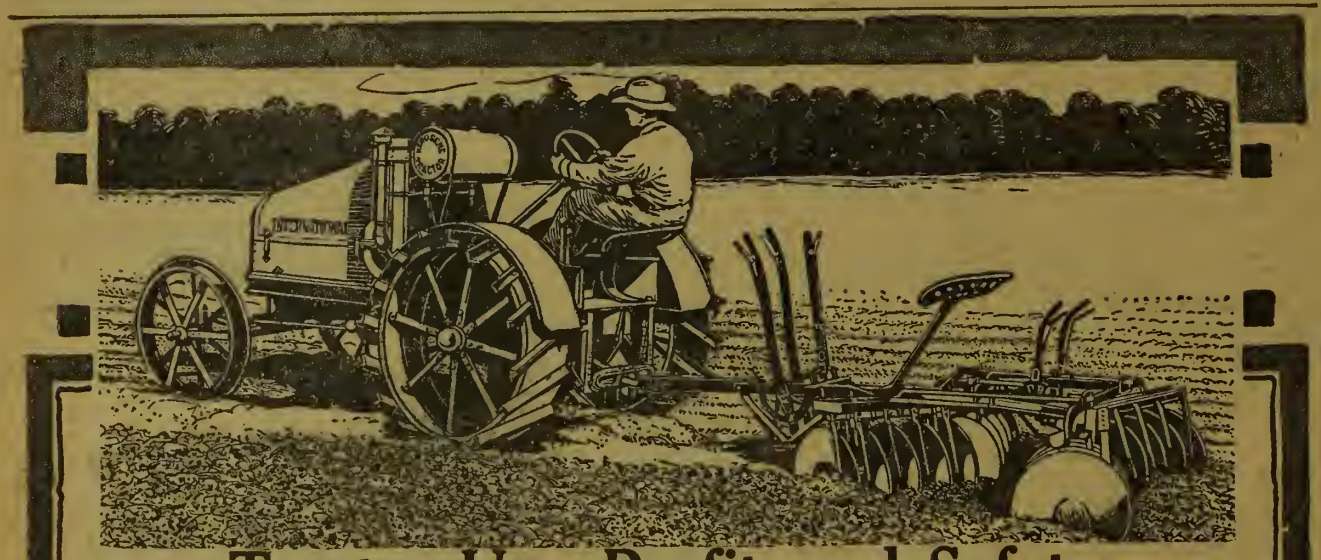
Time and money is being saved by more general bulk shipping this year than any preceding year. Shortage of labor has induced more general preparation for storage and handling of California grown grains. A believer in this method of grain handling writes:

"From three to four men can be saved on each harvester during harvest time by handling the grain in bulk from a hopper attached to a combined harvester from which grain is delivered into grain tight wagons, and from six to eight men at the warehouses where the grain is received and stored in sacks."

ALL BOOKS ARE NOT SO DRY

Card from a local station agent to a studious citizen:

"Sir—Please send, without delay, for the case of books directed to you, which is lying at this station and is leaking badly."—Office Economist.



Tractor Use, Profit, and Safety

TRUE progress is always slow. The change to mechanical power for farm work has been twelve years in the making, but today there are few American farmers who have not given serious thought to the question of tractorizing their farms.

For the benefit of those who may not yet be convinced that the tractor is a useful, profitable farm power machine, we present again a few of the opinions of farmers who are using the International Kerosene Tractor. Some of these are about essential features, and some mention only conveniences, but taking them altogether, almost any farmer will feel, after reading them, that the International 8-16 is a tractor worth considering.

"My International supplies a power flexible enough to handle the large amount of seedbed, harvest and other work without delay."

"It can be used for continuous work if emergency demands it."

"It produces power at much lower cost than horses, and it can be used for both drawbar and belt work."

"I like the steady way it works. Without seeming to hurry, it gets through a surprising amount of hard work."

"It does a lot of good work at a cost so low I could hardly believe it. You did a wonderful thing for Eastern farmers when you made this tractor to run on kerosene."

"It is not bothered by flies, nor by bumble bees. It works steadily on the hottest days."

"Requires very little care. When the day's work is done, I run the tractor tail first into an inexpensive shed. In the morning, I fill the fuel tank and the oiler, look into the radiator, and am ready for another day's work."

These opinions are typical. They prove at least that the International 8-16 is a useful, profitable tractor. Now consider just one other thought for a minute.

This tractor is the outgrowth of twelve years of active tractor experience by a company that has sold all kinds of farm machines for many years. The beginning of this business goes back to 1831—almost 88 years ago. Does it not seem reasonable that with this experience we should offer you a tractor that you could use with profit, especially when we expect to come back some day and sell you more of the machines listed in this advertisement?

If you are now convinced that the International 8-16 is a useful, profitable tractor on some farms, and that you don't have to be an expert to buy one safely, write us to find out what this tractor will do for you, on your farm. A post card will bring you full information.

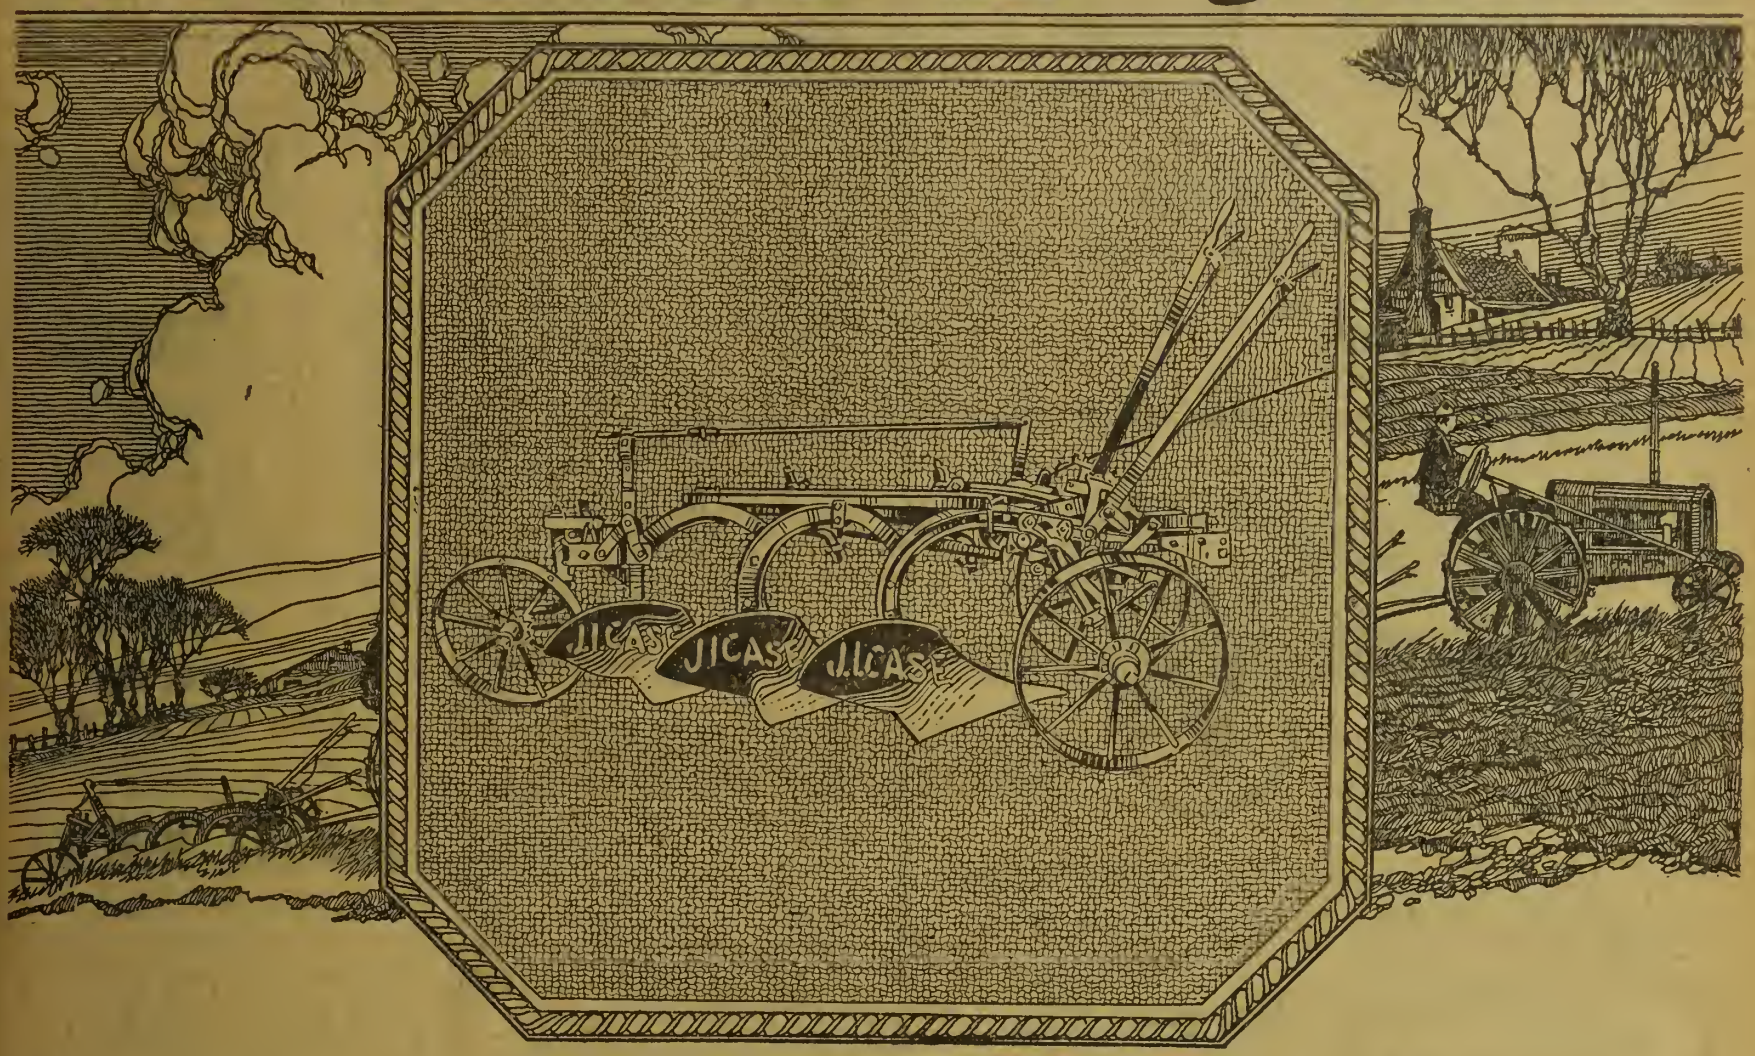
J. I. CASE Tractor Plows



Case Plows Increase Your Tractor's Efficiency

The J. I. Case Tractor Plow combines the most advanced ideas in the design and building of modern power farming implements.

It includes a combination of tested and proved features that have set an entirely new standard of tractor efficiency.

J. I. Case Light Draft

Scientific design and high quality materials produce uniform depth and smoothness of furrow which result in extremely light draft. Weight is carried on dust-proof, easily lubricated wheels.

Because of the short-coupled design Case plows insure uniform work in uneven or irregular ground.

Raising and lowering the bottoms of a Case Plow does not change position of depth levers. Once set they require no further attention.

Beams, levers and all parts under strain are of high-carbon steel, well-braced at every point, giving a staunch, well-built, long-lived plow.

A Plow for Every Tractor

Case Tractor Plows are made in various sizes and types—standard, medium-duty and heavy-duty—adapting them for use with any tractor, and for any conditions of soil.

The 2-bottom, 12-inch model is ideal for farmers who have a light tractor. The 3-bottom, 14-inch is standard—may readily be changed to a 2-bottom if desired — and when reassembled fits perfectly—thus giving the user two plows at price of one.

We also furnish medium-duty and heavy-duty, power-lift plows in 2 to 4-bottoms, designed to be used as units or in combination for heaviest work and with the most powerful tractors.

88 Points of Inspection

Case inspectors check 88 points of construction before shipment. Every plow must pass this rigid test before being approved. We know of no other standard requirements so high as the Case.

The Case is the most popular plow on the market today, and because of its many splendid features is a favorite in all parts of the country.

Write For Catalog

Your name and address on a post card will bring you a catalog of J. I. Case Power Farming Implements with full description of the famous J. I. Case Plows.

THE BUREAU OF MARKETS

Continued from Page 335

ating the bureau of markets from July, 1919, to July, 1920, was unmercifully slashed in committee hearings and finally passed carrying only a small fraction of the amount which had been available when the Pacific Coast offices had been opened. Consequently Portland, Seattle, Butte, San Francisco and several field stations were soon discontinued. The leased wire will probably be dropped from Kansas City west on the first of October and only a skeleton organization retained around which to rebuild should the farmers of the country who have been deprived of this service, make themselves heard in Washington. The office space in Los Angeles has been curtailed and the force cut down. A few bulletins are still being issued under the direction of C. J. Hansen who is now in charge of the office, but what will happen after October 1 no one will venture to say.

The grower is only able to know if he is receiving a fair price for his product when he knows what it is actually selling for in the Eastern markets. He has learned that he cannot depend upon this information when handed out to him by the man who wants to buy his crop, and the ordinary quotations in trade papers are usually too old to be of value when he sees them. In most cases he can not afford to get telegraphic advices even if there were some disinterested source to send them. Quick, reliable and comprehensive market information was his for the asking every day when the bureau of markets was in full operation.

To the grower who is a member of a strongly organized cooperative enterprise which itself furnishes this information, the reports of the bureau of markets were of little value. For that reason when the Los Angeles office was opened, no effort was made to issue bulletins on oranges or lemons because the growers themselves keep constantly posted on market conditions through the information supplied by their association. The work of the bureau of markets particularly benefited the disorganized producers, and they are naturally the last ones to make a concerted complaint against the discontinuance of such a service.

It is a significant fact that since it became evident that the bureau's activities would be curtailed, a great many of the men have resigned to accept more lucrative employment in commercial firms who in general have been quick to appreciate the intimate knowledge of distribution and marketing methods gained by these former government employes. Unlike so many of the government activities, training in the bureau of markets fitted the men eminently well for work in actual business with the firms with which they constantly came in contact.

In the opinion of many men both in and out of the government service, the limiting of the activties of the bureau of markets at this time has been a serious blunder. It is a mistaken effort at economy to cripple a service which has been of such notable assistance to the farmers in enabling them to secure a large proportion of the consumer's dollar.

PAINT YOUR PORCH CHAIRS

It should be remembered that porch furniture is subjected to out of door weather conditions. That means it should be protected by a good coat of paint; otherwise it cannot be expected to look clean and neat, nor will they last as long as they should.

A porch furniture enamel should be used if thorough satisfaction is desired. It is designed to meet all the weather and wear conditions to which outdoor furniture is exposed, at the same time producing a hard smooth surface that will not soften or become sticky, thus protecting the clothing of those enjoying the open air.

In applying porch chair enamel, care should be taken to brush it out well so that an even coating may be produced. Where the enamel is applied too freely it is apt to sag or form blisters, thus retarding the drying in such places, and will, in all probability stain the clothing of the one sitting on the chair, even though the chair is dry and hard everywhere else.

Cletrac TANK-TYPE TRACTOR

(Formerly known as the "Cleveland" Tractor)

The Embodiment of Compact Power—

More kinds of work
More days in the year

THE Cletrac Tank-Type Tractor is only 96 inches long, 52 inches high and 50 inches wide. *But in spite of its small size it will do the work of six horses or mules*—and has a speed of from forty to fifty per cent *greater* than the *average* tractor.

It is the embodiment of compact power. It produces food but consumes none of it. It never gets tired. Unaffected by heat. It works all day—and all night too if necessary.

More kinds of work, more days

It does better, quicker, cheaper work—and does it *twelve months in the year.*

Plowing is *only the beginning* of its work. It harrows, plants and reaps, binds, threshes and hauls, grades, saws, and fills silos, spreads manure, digs potatoes and does practically all the other jobs formerly done by animal and stationary power.

Can be used on the seed bed

Because of its distinctive tracklaying construction the Cletrac is specially adapted to seed bed work. Eight hundred square inches of traction surface enable it to go over soft plowed ground or moist or sandy surfaces *without sinking in and without packing down the soil*—two invaluable assets not found in the ordinary tractor—two assets essential in the proper preparation of the seed bed.

Ideal for orchard and hill work

The tank-type construction of the Cletrac gives it a tremendous advantage in doing side hill work, or in climbing steep grades.

Its small size and short turning radius enable it to go under and among small trees and are largely responsible for its pronounced preference among orchard owners. A million farmers and orchardists can profitably use the Cletrac twelve months in the year.

An economical tractor—burns kerosene

The Cletrac operates on a surprisingly small amount of gasoline, distillate or kerosene, but is specially designed to use kerosene. It takes less space in your barn than a horse. It eats only when it works.

Sales and Service go together

Our sales and service organizations go hand in hand. Wherever you can get the Cletrac you can get genuine Cletrac service backed up by the strength and reputation of The Cleveland Tractor Company.

Early ordering is essential, as we cannot promise prompt delivery very far ahead. See your Cletrac dealer *now*, or write us for information. We have a very interesting booklet *"Selecting Your Tractor"* that will give you much valuable information on tractor farming. Write for your copy *today.*

The Cleveland Tractor Co.

19077 Euclid Avenue **Cleveland, Ohio**

Largest producers of tank-type tractors in the world

The LAUSON Leads

at Walla Walla. Washington

In the most remarkable, sensational showing ever made by wheel type tractors, the LAUSON carried off first honors over other *wheel type* tractors at Walla Walla. The LAUSON negotiated the 35% grade and the 43% side hill with ease.

The LAUSON pulled three 14-inch mold-board plows to an average depth of 7 inches without a stop or delay for repair of any kind and operated throughout the demonstration on kerosene. This proves again that the LAUSON has surplus power, greater stamina, more efficiency at the drawbar, better distribution of weight, greater ease of handling. If you are thinking about buying a tractor, find out *why* the LAUSON is known as **"The Pattern Tractor of the Industry."**

There are 24 sets of Hyatt and Timken roller and ball bearings which make the LAUSON the FULL JEWEL TRACTOR

IRRIGATION SYSTEM

Neither alfalfa nor orchard cultivation can be conducted advantageously without an efficient Irrigation System Now is the time to install your system as all indications point to much higher prices in the very near future. Don't delay, but write today for literature and any information you may require on the subject of Irrigation. The advice of our experts is yours for the asking.

Keeping the "Rub" in Rubber

By James De Camp

EVERY veteran motorist remembers a time in his driving career when, following an epidemic of flat tires and blowouts, he has felt like telling the world that his car could be bought for 30 cents, cash or terms, with gloves and goggles thrown in for good measure.

It seems that all car owners must pass through this slough of despondency before realizing that it is a good policy to anticipate and prepare for their tire troubles. Some swear that blowouts and tube rips, like bananas, come in bunches. They attach a superstitious significance to this grouping together of disasters although they are heartily amused at the man who carries a rabbit's foot for his rheumatism and will not walk under a ladder. There is no secret behind a "streak" of tire trouble. It comes from uniform abuse of one's rubber or aging of the tire equipment. Casings and tubes of like quality installed on or about the same date will age at a certain rate and go to pieces within a few weeks of each other.

We do not wear a suit of clothes month after month and year after year until some fine evening we are obliged to walk home inside of a barrel. Yet many car owners drift along on a set of tires that have developed serious defects through abuse or are far past their period of usefulness without giving the least thought to the matter until a fusillade of explosions causes a crisis.

The war, scarcity of rubber and the correspondingly higher cost of casings and tubes have made it imperative to stretch every dollar expended for tire equipment over the greatest possible number of miles. By using a bit of common sense many are simultaneously reducing their rubber bills and securing better service.

There are two cardinal sins committed by the American motorist which result in the wasting of hundreds of thousands of dollars annually. These twin counts, on which we stand convicted by our own confession, are the carrying of spare tires unprotected and the keeping of loose tubes in the tool compartment.

Tire covers are not expensive when compared to the saving they effect, yet many otherwise sane persons will permit sun and rain to extract a thousand miles of service from the "spare" before it touches the road. This practice is just about as consistent as inviting a thug to pick one's pockets. The extra tires should not be kept inflated to full pressure while on the rack. With medium sizes 40 or 50 pounds will suffice to carry the car to the next air station after the spare has been put in service.

Twenty-four hours of shuffling about in the tool box is the equivalent of a full month's wear on an inner tube. Many new tubes become absolutely worthless from contact with sharp tools and constant rubbing against projections. Extra inner tubes should be carried in the special tube bags made for the purpose or properly folded and wrapped tightly in several thicknesses of heavy paper. Tubes carried for a length of time should be inspected occasionally and re-folded to bring the creases at new points.

There are hundreds of outfits on the market for the repair of inner tubes. Experience shows that when the rent is on the outside of the tube the home-made job of patching is usually satisfactory. When the trouble is located in that part of the tube next the rim it invariably saves trouble to have the repairing done at a vulcanizing shop.

An occasional inspection of the casings will forestall nine-tenths of the trouble from that source. Just as the tiny discolored spot on a tooth gradually spreads to cause distress and pain the small cut or rent in the tread will develop into something more serious unless repairod at once. Clean tho cuts thoroughly and fill them with patching cement, repair gum or some such product made for the purpose. The few minutes thus invested will yield compound dividends in time and expense saved later. If permitted to remain open cuts may fill with sand and mud, this foreign matter working in between tread and fabric and forming unsightly "blisters" and "boils" which result in blowouts.

Blowouts are the bugaboo of motoring. Among their possible causes are under-inflation, overloading, blows and and bruises, moisture getting to the fabric through unrepaired cuts and plain defects in the construction of the tire. The latter possibility has been almost entirely eliminated by improved methods of manufacture.

Tire manufacturers state that three-fourths of the casings returned to them for repairs and adjustments give evidence of inadequate inflation. Compared to the weight which it has to support and the shocks and blows which it must stand up to the casing is but a frail shell. Its inner support is the air with which it is filled. When the manufacturer states on the outside of the tire that a certain number of pounds of air should be kept inside he knows what he is talking about. When a tire is driven with insufficient pressure inside the walls of the casing bend back and forth, causing friction and developing weak spots in the fabric. The principle is exactly the same as that of folding and unfolding a piece of wire until it parts in the center. Ultimately something gives way and there is grief in the family.

It will often be observed that one tire is wearing down its tread more rapidly than the others on the machine. In seeking the cause of this the first point is to be certain that your wheels are in perfect alignment. New casings have been known to go to pieces in 500 miles when mounted on wheels out of true. If the tire in question is on the rear the brakes should be carefully inspected, since it is highly probable that the worn casing is stopping more than its share of the load. Unless one is experienced at this work it is advisable to have all brake adjustments made by an expert mechanic.

When the rear tires begin to show unmistakable signs of wear and those on the front are yet in good shape the pairs should be shifted. Such a change affords ideal opportunity to inspect all the casings thoroughly, mending cuts and probing for bits of rock, metal or other foreign matter that may have penetrated the tread and be working toward the fabric.

Grease and oil have a marked deadening effect on the resiliency and resistance of rubber, making it flabby and jelly-like. If your rear axle throws grease remove the cause at once and clean the surface of the tread thoroughly with gasoline.

The immense growth of the automobile industry has caused the formation of organized gangs of tire thieves. These criminals are reaping a heavy harvest, especially on the Pacific Coast, specializing on popular sizes such as the 34 by 4 casing. When owners have marked their property with an unmistakable sign of identification the police can very frequently recover it for them. The most effective method is to place the owner's name or some symbol on all tubes and the inside of each casing with a moistened indelible pencil. Carrying a good spare tire unprotected by padlock is an open invitation to this brand of crook.

Here are a few tire tips to paste in your hat:

Remove skid chains as soon as possible after a rain.

Keep off car tracks and out of ruts.

Do not overload.

Cover your spare tire.

Use plenty of air.

Keep an air-guage handy.

Dust inside of casings with talc before inserting tubes.

Repair cuts promptly.

Avoid sudden stops.

Keep grease and oil away from rubber.

Test supposed leaky valves with a cup of wator.

Replace tho old rubber bofore it becomes entirely useless.

THE TRUCK, THE TRACTOR AND BETTER ROADS

By E. A. Williams, Jr.

The truck, the tractor and good roads!

In a combination of these factors lies the solution to one of our greatest economic problems, the production and marketing of the world's food supply.

With the crying need for food in the war stricken countries of Europe and the never ceasing demand in those lands not vitally affected it is evident that the world's agricultural resources must be worked to the utmost to meet the existing emergency

We realize, after glancing at the daily market prices, that every American citizen is making contribution to this campaign. We do this uncomplainingly because we think the cause is just and our duty plain, yet we are begining to wonder just how long these conditions are going to exist before a remedy is found.

The truck and the tractor, aided by improved highways, hold the solution. Just as in the recent war the truck and tractor came to the fore and made themselves prominent factors in the allied victory, they are destined to become even greater factors in the era of reconstruction.

Manufacturers of dairy products are using the truck extensively both for the collection of materials through the farming districts and the delivery of their finished products to city customers.

A statistician has estimated that more than 100,000 tractors are in operation on the farms of the Unfied States at the present time, an increase of more than 50 per cent over those in use at the beginning of 1918. The reputation these sturdy little machines have gained during the war assures a greater demand for them in the coming year. With their more universal adoption will come increased acreage and greater crops. This will call for better transportation facilities and improved roads.

The truck already is playing a conspicuous part in the transportation of commodities. Its possibilities in this field have ceased to be a matter of the future, although it is yet in the primary stages of development.

STANDARDIZING SWEET POTATOES

Some of the Portuguese sweet potato raisers in Stanislaus County are rebelling at the regulations imposed by the standardization law. In announcing a meeting of growers and of state standardization officials the Turlock Journal says:

"Portuguese sweet potato growers are up in arms against the proposed standardization rules submitted by Horticultural Commissioner Arthur E. Beers of Merced County, and will fight their adoption at the meeting. They claim that if the drastic regulations are adopted it will drive them out of business and some of them have threatened not to plant any more sweet spuds if the regulations go into effect.

"County Horticultural Commissioner A. L. Rutherford declares that the Portuguese growers are working under a misunderstanding. The rules have not yet been adopted and if the protesting growers are in a majority, there will be a modification.

"Beers' proposal is that there shall be four grades of sweet potatoes. Many of the growers declare that this is too strict and advocate only two classifications. The No. 1 grade should include potatoes from 1½ to 3½ inches in diameter and No. 2 grade should include spuds that are over sized or slightly affected by worms or disease, they ask. Small potatoes can be sold to canneries as by-products.

"'The object of the meeting Tuesday,' says Rutherford, 'is to give the growers an opportunity to decide what regulation they desire. We are not trying to force anything on them that they do not want and which is against their best interests. Unless more than 50 per cent of the sweet potato men of the Turlock section are represented the rules will not be binding upon them.'"

Avery Orchard Tractors

Are Now Built in Two Sizes

5-10 H.P. and 8-16 H.P.

Announcing the Arrival of the New Member of the Avery Family

The 6-Cylinder 8-16 H. P. $895

To meet the large demand for Orchard Tractors especially designed for California conditions we have built and perfected an 8-16-H.-P. tractor with a 6-cylinder motor which has a built-in-governor, high-tension magneto, three-speed transmission and equipped with Hyatt roller bearings throughout. It is low, 48 inches. It is short, turns 10 feet radius. It pulls two 14-inch or three 10-inch plows or a 6-foot double disc. You can now enjoy that same smooth flexibility in your tractor motor that formerly you could only have in your automobile.

For the groves of from 10 to 25 acres we have the late improved 5-10-H.-P. Model B—$775.00.

AVERY HEAVY-DUTY TRACTORS for open-field work are built in six sizes, 8-16-H.-P. to 40-80-H.-P. There is a size AVERY to fit your size farm, whether open field or grove.

Pomona Air Cleaner

Keeps Dust Out of Tractor, Truck, and Auto Motors

Would you allow anyone else to pour grit into your motor? Are you doing it yourself? Examine and see. For every grain of dust that sticks in your carburetor intake, a million go on through to grind out your motor.

Let a Pomona Air Cleaner protect your motor. Do not wait until the damage is done. Get one now.

If you already have a clarifier be sure to examine and see whether it is doing its work. You can use both kinds together if you like. We guarantee that you will not find any dust in the air that has passed through the Pomona Air Cleaner. If, on trying the two together, you find that your present equipment is giving your motor protection we will gladly take back our apparatus and refund your money.

Above all else keep dust out of your motor. Treat your motor right. Send for descriptive circular and names of users in your neighborhood.

If you buy a tractor, truck or auto ask your dealer to equip it with a Pomona Air Cleaner.

Watch for it on Tractors at the Tractor Demonstration.

Congestion of the Brain

My horse falls asleep in harness and falls down; especially while standing in the sun and hitched to a buggy. What is the remedy?—Subscriber, Fresno.

Congestion of the brain caused by thick blood and sluggish circulation. Usually seen in overfat horses. It comes near being sun-stroke in your case. For immediate relief probably the old fashioned remedy of bleeding is best; that is by taking two or three gallons of blood from the jugular vein. Or give the following remedy: Two ounces of bromide of potash, one ounce of the tincture of aconite and enough water to make one pint. Give one ounce of this mixture in the drinking water morning and evening while it lasts. To prevent the trouble returning mix two pounds of epsom salts and one pound of common salt and give a handful in the feed once a day. This will thin the blood so it will flow more freely through the smaller blood vessels.

Wire Cut

We have a colt that got a bad wire cut in the pastern some time ago. It has healed over except in one place where it is still scabby. The joint is quite thick, which I think is due to proud flesh. Could it be opened and something applied that would help? The colt is not lame but we fear it will be if put to work, or would that help to absorb the swelling? What would you advise?—Subscriber, Lincoln.

There can not be any proud flesh in the swelling as that is always open, very sensitive to the touch and bleeds if you touch it. As there is no lameness now there probably never will be. Reduce the swelling with the following liniment. Have your druggist prepare it for you. Corrosive sublimate one dram, alcohol one ounce, and enough turpentine to make one pint. Shake and apply enough once a day to the swollen parts to wet the skin. If the liniment seems too strong then rub in a little lard once a week but wipe it off before applying more. The cut probably reached the tendon and may leave some enlargement. It it had reached the joint the colt would be lame and a ringbone might follow.

Skin Disease

I have a Percheron stallion that is troubled each summer with pimples on the skin. He will rub and scratch with his teeth on the front legs and make bare spots about a quarter of an inch in size. The pimples also come on the breast and neck and the rubbing makes the skin rough and scabby. What is best to do for it?—Subscriber, Heber.

The trouble is probably partly due to overfeeding. Feed less and give more exercise. Wash the affected parts with a solution of zenoleum, using a teacup to a bucket of warm water. Repeat it every few days until the irritation stops. Also get a pint of Fowler's solution of arsenic. Commence by giving half ounce doses once a day. After a few days increase the dose to one ounce a day, and when the bottle is nearly empty finish by giving half ounce doses.

Hair Coming Out

What is this and what will cure it? I have a Jersey calf that was nice and fat when born but a week later the hair commenced coming off around the ears and neck. Now it is coming off all over the body and thick white scales are forming. Flies are also bothering it.—Subscriber, Escondido.

Probably due to a mite getting into the skin. Bathe the calf all over with a solution of zenoleum, using a teacup to three gallons of warm water. Repeat this every three or four days until the hair starts. Also spray any posts or the side of the stall where the calf can rub with the same solution.

Simplified Spraying

DON'T spend your spraying day in profitless overhauling of an out-of-date inferior rig. Get results—not excuses.

Send for a catalog of California's favorite sprayers.

Boys! Win an Auto-Wheel
In This Interesting Contest

TO THE BOY who can think of the most interesting uses for the popular AUTO-WHEEL COASTER, for earning money and for play, we shall award one of our large models absolutely FREE. It's a mighty generous prize for a few minutes' work. And the following eleven valuable prizes will be given to those sending in the next best uses: Camera, Camping Tent, Mess Kit, Scout Knife, Fleetwing Steering Sled, Compass, Ingersoll Watch, Axe, Bank, Electric Flashlight, Poncho.

INFORMATION ABOUT CONTEST

1. Any boy or girl not over 15 years may compete.
2. Contest will be judged by three men well-known in the Boy Scout organization.
3. Write to Business Idea Dept., Buffalo Sled Co., for pamphlet explaining the Contest, and colored catalog telling all about Auto-Wheel.
4. At end of letter write names of three Coaster Wagon Dealers in your town. If any carry the Auto-Wheel put an "x" after name.

YOU can do it. Here are a few pointers: The Auto-Wheel is a strong, speedy wagon for work or play. Has roller bearings, steel axles and tires, body of white ash, maple gear. See the Auto-Wheel dealer in your town for ideas.

CONTEST CLOSES NOVEMBER 30, 1919.

Buffalo Sled Co., 173 Schenck Street, N. Tonawanda, N. Y. In Canada: Preston, Ontario.

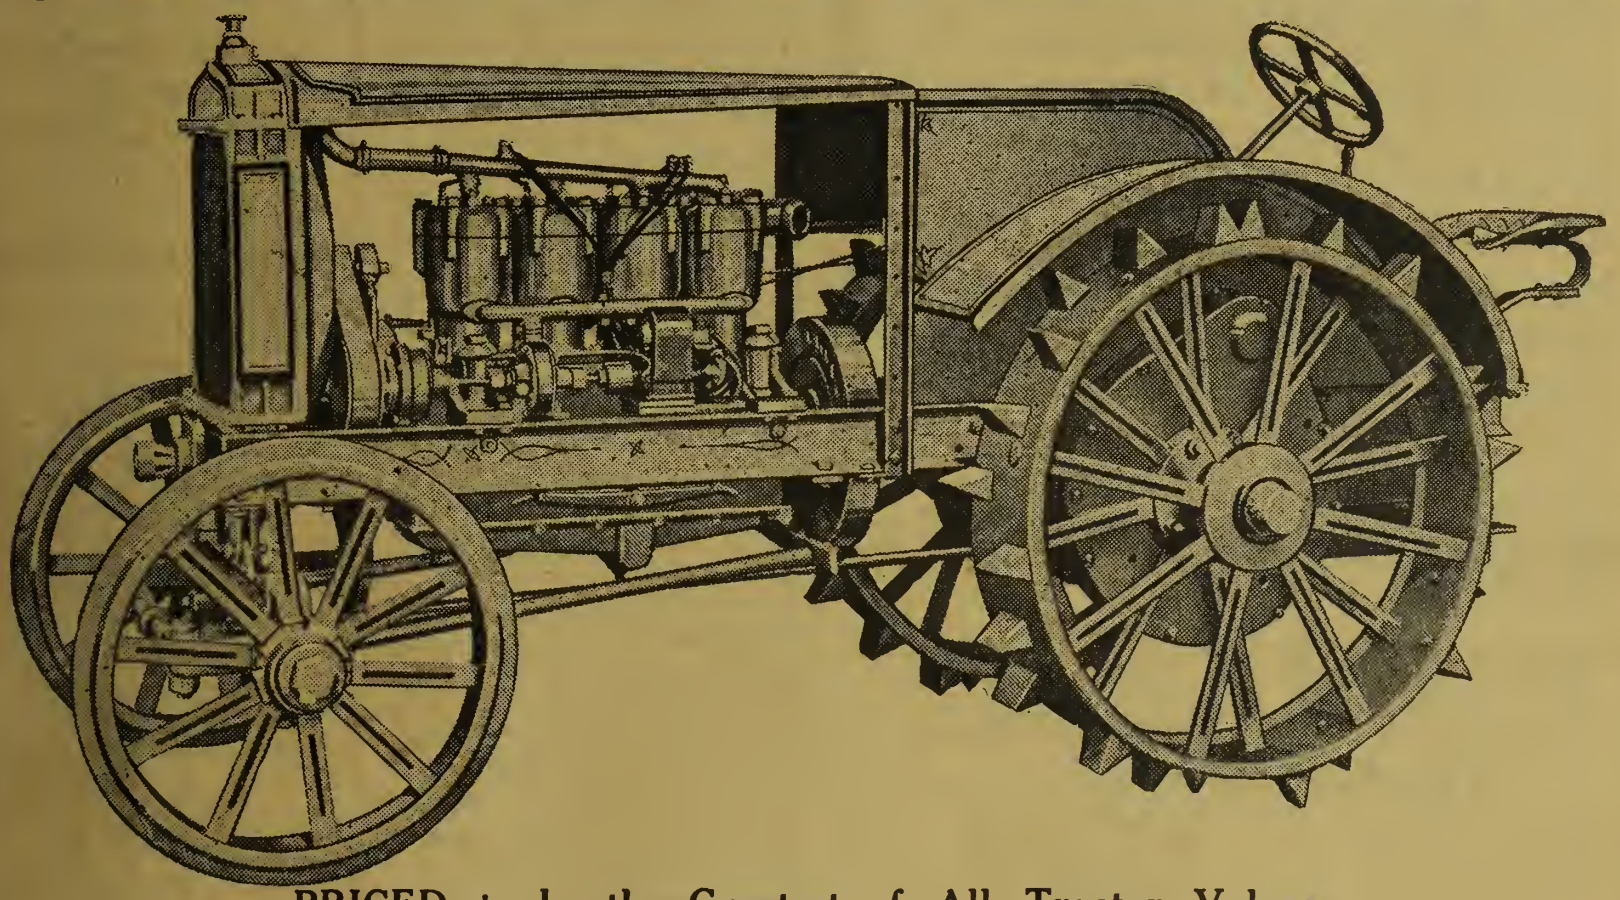
CALIFORNIA ORCHARD MODEL

of the famous

Allwork KEROSENE TRACTOR

Allwork II

12-22 h.p.---4x6 four cylinder motor---4000 lbs. weight and still only 50 inches wide, 55 inches high with a 75 inch wheel base and a remarkably short turning radius



PRICED to be the Greatest of All Tractor Values

All gears enclosed in a bath of oil.
Timken and Hyatt bearings throughout.
Rear axle differential.
Individual rear wheel brakes.
Kerosene or distillate burning engine.
High tension magneto.
Five bearing crankshaft.
Three speeds forward and one reverse.

Carefully working out every detail that is demanded by the orchardist and vineyardist of California, the old established Electric Wheel Company, Quincy, Illinois, announces the ALLWORK II Tractor built especially for California horticultural conditions and with specifications and performance that command the interest and attention of every producer of fruit.

The idea that has made this tractor so preeminent was the development of a very powerful engine in a short, low, easy turning tractor giving the owner *more power than he ever had before for the money, less load to bear down, more standard units and greater efficiency in a small working space especially around trees and vines.* We want you to see this tractor and pass judgment upon it.

Dealers who are looking for a tractor highly desirable in the citrus and deciduous districts of California will find the ALLWORK II will sell readily and be a service and satisfaction to the owners.

Orchardists will find in the ALLWORK II many features that have not been included in any tractor yet offered. If you cannot visit the Tractor Demonstration write us for full descriptive literature.

The Allwork II will be one of the features of the Los Angeles Tractor Demonstration, Sept. 16-21. (Northeast Corner of Grounds) **Come and See it.**

The Banner Sale of the Year

Wednesday, Sept. 17th, 1919

Hanford, Calif.

The state fair demonstrated the wisdom of breeding big type Polands. We will sell 40 big type sows and gilts bred to two of the greatest boars on the Pacific Coast,

The Yankee Jr. and Lendorris Liberty Bond

The demand for the blood which these two boars represent is far greater than the supply.

John M. Bernstein and W. L. Haag & Son

H. M. Bernstein, Auctioneer.

BEEF CATTLE AT THE FAIR

Continued from Page 329.

easily the outstanding Mission Chief, bred and owned by Bunting. This calf holds every promise of developing into a bull of high order, with plenty of size for age, a beautiful head, carrying a straight top and a deep flank, evenly balanced from front to rear and covered smoothly and thickly. He was one of the outstanding entries of the show and after being made junior champion, his general balance carried him above the senior champion.

The female classes were comfortably filled and all held competition. The three-year-old cows were headed by Pearl, a polled entry from Colorado, that is quite the best polled cow seen in the West. She is a show cow from any angle. Full of bloom and a block of beef with a beautiful head and exceptional style, she had a comparatively easy time downing all competition clear through to the final championship.

Barngrover was second and third with Lulu 14th and Cinderella, and Emmons was fourth with one without horns. Five two-year-olds, two with horns, were headed by Miss Betty, shown by Bunting. Her position at the top was not questioned. Emmons was second with a poll over Barngrover's horned entry, because of size and a bit stronger top, though lacking as sweet a head and balance. Two polls stood fourth and fifth. Bunting was again to the front in the senior yearlings with Lady Jane over Barngrover, and Emmons stood third with a poll. The junior yearlings were topped with the attractive smooth-headed, Woodford Lady P from the Brunton herd. Bunting was second over Barngrover by virtue of more size and thickness. Barngrover easily stood above the fourth and fifth—both polls. Bunting led off the senior heifer calves and Barngrover was second over a poll shown by Brunton. The third calf had size, but was bare of top and coarse throughout. It was 50-50 in the junior heifer, with the judge liking the polled calf.

Barngrover had the only aged herd and was first with his calf herd. Bunting won on his produce of dam and Brunton won the get of sire. The awards follow:

Exhibitors: J. A. Bunting, Mission San Jose; H. M. Barngrover, San Jose; G. W. Emmons, Oakland; J. D. Brunton, Aspen, Colorado; Riverside Hereford Ranch, Northern Nevada.

Aged bulls—1, Barngrover on Patrician 5th.

Two-year-old—1, Riverside Hereford Ranch on Alamo Reuben; 2, Emmons on Grove's Perfection; 3, Emmons on Witchford.

Senior yearlings—1, Bunting on Alec; 2, Brunton on Echo Repeater; 3, Emmons on Junior Grove.

Junior yearlings—1, Brunton on Bonnie Grove; 2, Emmons on Diablo Fairfax.

Senior bull calves—1, Bunting on Mission Prince; 2, Barngrover on Plumas Lad 2d; 3, Barngrover on Prince Patrician; 4, Brunton on Repeater Grove.

Junior bull calves—1, Bunting on Mission Chief; 2, Brunton on Perfection Grove.

Senior champion bull, Patrician 5th.

Junior champion, Mission Chief.

Grand champion, Mission Chief.

Three-year-old cows — Brunton on Pearl; 2, Barngrover on Lulu 14th; 3, Barngrover on Cinderella; 4, Emmons on Lady Berenda.

Two-year-olds—1, Bunting on Miss Betty; 2, Emmons on Sally Clark; 3, Barngrover on Mary Jane; 4, Emmons on Cherry Grove; 5, Emmons on Blue Belle 4th.

Senior yearlings—1, Bunting on Lady Jane; 2, Barngrover on Thelma; 3, Emmons on Laura.

Junior yearlings—1, Brunton on Woodford Lady P; 2, Bunting on Mission Girl; 3, Barngrover on Normalene; 4, Emmons on Belle Poll 3d; 5, Emmons on Mineola Fairfield.

Senior heifer calves—1, Bunting on Mission Lass; 2, Barngrover on Lulu's Pride; 3, Brunton on Belle Grove 2d.

Junior heifer calves—1, Brunton on Miss Woodford; 2, Barngrover on Patrician Sue.

Senior champion cow—Pearl. Junior champion—Woodford Lady P. Grand champion female—Pearl.

Graded herds—1, Barngrover.

Calf herds—1, Barngrover; 2, Brunton.

Produce of cow (two)—1, Bunting; 2, Barngrover.

Get of sire (four)—1, Brunton; 2, Barngrover.

DAIRY CATTLE AT 1919 CALIFORNIA STATE FAIR

By C. L. Hughes

While the railway strike in Southern California was the cause of a curtailment in numbers of dairy cattle exhibited at this year's state fair, the Dupee Guernseys and Santa Anita Rancho Holsteins not showing as a consequence, yet it passes into history as one of the best displays yet seen in the West. The observer who has been familiar with all of the dairy cattle shows at this fair for many years past finds renewed satisfaction each year in the younger classes, evidence that our breeders are not only using wisely selected sires, but that they are mating these sires with a superior lot of dams and securing a splendid growthiness and quality in the offspring. In such respects do we find a great deal of promise for the future dairy cattle of California.

The Ayrshires

The Ayrshire classes were the first to appear in the show ring, and they made a fitting beginning for the big show. Three herds were shown, those of J. Henry Meyer, E. B. McFarland and Preston School of Industry. Many splendid representatives of the breed were found in each herd, although the Meyer herd succeeded in taking home both grand championships, after the keenest sort of competition with McFarland in most of the classes. The awards follow:

Exhibitors: E. B. McFarland, San Francisco; J. Henry Meyer, San Francisco; Preston School of Industry, Waterman.

Two-year-olds—1, Meyer on Imp. Holehouse Secretary; 2, McFarland on Steybrae Improver; 3, MeFarland on Steybrae Commander; 4, Preston School on Steybrae Masterpiece; 5, Preston School on Premier.

Senior yearlings—1, Preston School on Preston Prince Bangios.

Junior yearlings—1, Preston School on Preston Ravendale.

Senior bull calves—1, Meyer on Elkhorn Public Opinion; 2, McFarland on Steybrae Monarch; 3, McFarland on Steybrae Master Douglas; 4, Meyer on Elkhorn Mariner; 5, Preston School on Preston Masterpiece.

Junior bull calves—1, McFarland on Ayrmont 359; 2, McFarland on Ayrmont 361; 3, Meyer on Elkhorn Royal Review; 4, McFarland on Steybrae Bobbie Burns.

Senior champion bull—Imp. Holehouse Secretary. Junior champion—Ayrmont 359. Grand champion — Imp. Holehouse Secretary.

Three-year-olds—1, Meyer on Torr of Elkhorn; 2, McFarland on Auchinbay Jean 8th; 3, Preston School on Cedar Hill Princess.

Aged cows—1, Meyer on Highland Ithan; 2, McFarland on Maple Leaf Lily; 3, McFarland on Sunnyside Governess; 4, Meyer on Curfew Bell 3d; 5, Meyer on Hancroft Favorite.

Two-year-olds—1, Meyer on Robin's Lucy of Elkhorn; 2, McFarland on Steybrae Jennie Deans; 3, Meyer on Baron's Blue Bell; 4, Preston School on Steybrae Ellen; 5, McFarland on Grace Darling.

Senior yearlings—1, Meyer on Baron's Snow Maid of Elkhorn; 2, McFarland on Steybrae Kirsty; 3, Preston School on Preston Dewdrop 2d.

Junior yearlings—2, McFarland on Steybrae Nona; 2, McFarland on Burnside Miss Courtney; 3, Preston School on Preston Nellie Osborn; 4, Meyer on Elkhorn Kirsty; 5, Preston School on Preston Princess.

Senior heifer calves—1, Meyer on Elkhorn Heatherflower; 2, McFarland on Ayrmont 357; 3, McFarland on Ayrmont 353; 4, McFarland on Steybrae Edna; 5, Meyer on Elkhorn Snowflake.

Junior heifer calves—1, Meyer on Elkhorn Thistledown; 2, McFarland on Steybrae Gem; 3, McFarland on Steybrae Alta; 4, Preston School on Preston Princess 2d; 5, Preston School on Preston Sconcy Maid.

Senior champion cow—Highland Itham Junior champion—Elkhorn Heatherflower. Grand champion female—Highland Itham.

Graded herds—1, Meyer; 2, McFarland; 3, McFarland.

Young herds—1. McFarland.

Calf herds—1, McFarland.

Produce of cow (two)—1, McFarland; 2. Meyer; 3, McFariand.

Get of sire (four)—1, McFarland; 2. McFarland; 3, Meyer.

The Holsteins

With over 100 head of Holsteins to face the judge competition was of the keenest sort in most classes, and the list of awards falls far short of indicating the entire story of the show. The outstanding feature of the show was the exhibit of Bridgford Holstein Company, and their sensational winnings were due largely to the great bull, King Segis Alcartra Prilly and his get. This bull was for the third consecutive year returned grand champion, while his daughters won first senior yearling, first junior yearling, first and second senior heifer calves, first and second junior heifer calves, grand champion female, first and second get of sire, first calf herd, first breeders' young herd, and he sired the first and second prize produce of dam. A splendid showing was made by Henderson Company, who annexed a number of first prizes and the junior championship on bulls, the latter a son of Supreme Glista Pietje. Jane Garden Farm did not have a full show herd, but made an impressive showing in the female classes. W. J. Higdon was a much stronger contender in most of the classes than a survey of the awards would show, losing a number of hair line decisions, and showing a herd that met with high popular favor. The same is true of the herd shown by The J. S. Gibson Company, who ap-

peared frequently in the money. H. E. Cornwell showed only a few head, among them the first prize two year old who won top honors in a large class that had considerable spread in quality between top and bottom. R. L. Holmes showed only young things but they were good enough to be a source of pride to any breeder. V. F. Dolcini made his initial showing in a manner that should be highly encouraging to him, winning first in a hot senior bull calf class with the splendidly bred young bull he recently purchased for a herd sire. Frank Anderson showed one animal, a junior heifer calf, daughter of King Mead of Riverside, and she was strong in fourth place in one of the hottest classes of the show. The awards:

Exhibitors: Frank B. Anderson, Sacramento; Anita M. Baldwin, Santa Anita; Bridgford Company, Patterson; V. F. Dolcini, Davis; H. E. Cornwell, Modesto; Jane Garden Farm, Sacramento; J. S. Gibson Co., Williams; Henderson & Company, Sacramento; W. J. Higdon, Tulare; R. E. Holmes, Modesto; J. Self, Williams.

Aged bulls—1, Bridgford on King Segis Alcartra Prilly; 2, Gibson on Segis Creamcup Pontiac Burke; 3, Higdon on King Korndyke Pontiac 20th; 4, Cornwell on Sir Johanna De Kol Rag Apple; Henderson Co. on King Lillian Walker Segis.

Two-year-olds—1, Henderson Co. on Model Domino Glista.

Senior yearlings—1, Higdon on Model Bonnie Fobes De Kol; 2, Henderson Co. on Manteca Korndyke Inka.

Junior yearlings—1, Henderson Co. on Bonita Sir Cornucopia Glista; 2, Dolcini on Tagus Sadie Vale De Kol.

Senior bull calves—1, Dolcini on Sir Aaggie Korndyke Mead; 2, Bridgford on King Hengerveld Alcartra Prilly; 3, Bridgford on King Adelina Korndyke Prilly; 4, Bridgford on King Segis Hengerveld Inka Prilly; 5, Bridgford on King Prilly Segis Pontiac.

Junior bull calves—1, Henderson Co. on Manteca De Kol Pierterje Inka; 2, Bridgford on King Pontiac Abbekerk; 3, Gibson on Prince Alcartra Korndyke 7th; 4, Holmes on Holmes De Kol Walker; 5, Jane Garden Farms on Jane Garden Omo Korndyke.

Senior champion bull—King Segis Alcartra Prilly.

Junior champion—Bonita Sir Cornucopia Glista.

Grand champion—King Segis Alcartra Prilly.

Aged cows—1, Bridgford on Spring Farm Pontiac Maid 2d; 2, Higdon on Mona Fobes; 3, Higdon on Model Bonnie Echo; 4, Henderson Co. on Colantha Ormsby 4th; 5, Henderson Co. on Model Pontiac Korndyke.

Three-year-olds—1, Henderson Co. on Klaare De Kol Korndyke; 2, Bridgford on Natalene Walker; 3, Higdon on Queen Pontiac Burke.

Two-year-olds—1, Cornwell on Ciruela Walker; 2, Bridgford Co. on Bos Cornucopia Butter Girl; 3, Henderson Co. on Manteca Fidessa Pontiac Inka; 4, Higdon on Fay Tritomia Hengerveld Walker; 5, Jane Garden Farm on Sadie Clothilde Vale.

Senior yearlings—1, Bridgford on Empress Pontiac Prilly; 2, Jane Garden Farm on Jane Garden Taploca De Kol; 3, Dolcini on Netherland Snowball; 4, Higdon on Miss Bracelet Fobes Korndyke; 5, Higdon on Blanch Nudene Clothilde.

Junior yearlings—1, Bridgford on Miss Orpha Pontiac Prilly; 2, Higdon on Miss Segis Alcartra Prilly; 3, Jane Garden Farm on Jane Garden Magnolia Korndyke; 4, Bridgford on Raphaella Pontiac Prilly; 5, Gibson on Aaggie Juliet Alcartra.

Senior heifer calves—1, Bridgford on Miss Konigen Pontiac Prilly; 2, Bridgford on Briar Aaggie Rag Apple Prilly; 3, Henderson on Manteca Segis Hengerveld; 4, Henderson on Manteca Piebe Clothilde; 5, Holmes on Holmes Silverton Alameda.

Junior heifer calves—1, Bridgford on unnamed; 2, Bridgford on Empress Pontiac Segis Prilly; 3, Gibson on Tilly Cornucopia Johanna; 4, Anderson on Juliana De Kol Mead; 5, Henderson on Manteca Walker Walker Colantha.

Senior champion cow—Springfarm Pontiac Maid 2d. Junior champion—Empress Pontiac Prilly. Grand champion female—Empress Pontiac Prilly.

Graded herds—1, Bridgford; 2, Henderson; 3, Henderson.

Young herds—1, Bridgford; 2, Jane Garden Farm; 3, Henderson.

Calf herds—1, Bridgford; 2, Henderson; 3, Jane Garden Farm.

Produce of cow (two)—1, Bridgford; 2, Bridgford; 3, Higdon.

Get of sire (four)—1, Bridgford; 2, Bridgford; 3, Higdon.

Dairy herd—1, Bridgford; 2, Jane Garden Farm.

The Jerseys

The steadily increasing demand for quality Jerseys was reflected in this year's show. There have been larger showings of the breed at this fair, but few that uncovered more satisfactory cattle. J. E. Thorp was a consistent winner, taking the grand championship on bulls and the much coveted first prize for five cows in milk, besides a number of other firsts in classes. Dr. Hand annexed the grand championship on females and was the closest sort of contender for first position in the class for five cows in milk. Guy Miller showed a herd that always finds many friends at the ringside and was a contender in most of the classes. S. F. Williams showed a number of entries from his good herd, showing only animals that were bred by him. E. E. Greenough made his initial appearance as an exhibitor and the favorable impression made by his herd indicates that it will be a factor in future shows. The awards:

Exhibitors: A. Cruikshanks, Sacramento; M. Fortini, Orland; E. D. Grecnough, Merced; Dr. H. W. Hand, Orland; L. J. Belknap, San Jose; A. M. MacKersie, San Jacinto; Guy H. Miller, Modesto; J. H. Sawyer, Galt; J. E. Thorp, Lockeford; J. E. Wherrell, Riverside; S. F. Williams, Chico.

Aged bulls—1, Thorp on Jolly Senator Raleigh; 2, Miller on Altama Interest; 3, Greenough on Fussy's Fern Noble 9th; 4, Williams on Golden Maidikins Boy; 5, Williams on Lucy's Warder Foss Boy.

Two-year-olds—1, Hand on Oxford Daisy's Keep On; 2, Hand on Blossom's Liberty Bond.

Senior yearlings — 1, Thorp on Golden Legacy's Champion; 2, Greenough on Opal's Golden Laddie.

Senior bull calves—1, Miller on Wanda's Altama Interest; 2, Thorp on Biddy's King of Mossdale; 3, Thorp on Salome's Idyl Boy; 4, Sawyer on Countess' Lad's Chieftain; 5, Hand on Oxford's First Prince.

Junior bull calves—1, Thorp on Jolly Ben of Mossdale.

Senior champion bull, Jolly Senator Raleigh.

Junior champion, Wanda's Altama Interest.

Grand champion, Jolly Senator Raleigh.

Junior heifer calves—1, Thorp on Queen Bess of Mossdale; 2, Greenough on Goldie's Golden Princess; 3, Williams on Chico Hope; 4, Miller on Fay of Venadera; 5, Thorp on Bettie of Mossdale.

Dairy herd—1, Thorp; 2, Hand; 3, Miller.

Aged cows—1, Thorp on Salome of Mossdale; 2, Thorp on Valet's Golden Biddy of L; 3, Greenough on Duchess of Lorina; 4, Thorp on Eminent's Wardress; 5, Hand on Imp. Brilliant Spray; 6, Miller on Goldie of Venadera.

Three year olds—1, Hand on Brilliant Jersey Queen; 2, Thorp on Naomi of Mossdale; 3, Miller on Angela of Venadera; 4, Williams on Aita La Foss.

Two year olds—1, Hand on Lumas Lola; 2, Hand on Birdie's Agnes; 3, Thorp on Pansy of Mossdale; 4, Miller on Cantata of Venadera; 5, Greenough on Goldie of Sunshine Farm; 6, Williams on Aleta Beau.

Senior Yearlings—1, Thorp on Goldie's Nehalem Cowslip; 2, Thorp on Fair Salome of Mossdale; 3, Thorp on Bonnie of Mossdale 2d; 4, Cruickshanks on Cionlee Rosalind; 5, Greenough on Beauty of Sunshine Farm; 6, Greenough on Patsy of Sunshine Farm.

Junior yearlings—1, Williams on King Hanford's Anna Girl; 2, Hand on St. Mawes Rosalind; 3, Miller on Daphne of Venadera; 4, Thorp on Marcella of Mossdale; 5, Miller on Arla of Venadera.

Senior heifer calves—1, Fortini on Jewel of Tintagel; 2, Hand on Aaggie of Tintagel; 3, Hand on Brilliant Spray's Glorianna; 4, Miller on Dagmar of Venadera; 5, Miller on Melba of Venadera; 6, Thorp on Naomi of Mossdale.

Senior champion cow, Brilliant Jersey Queen; champion, Jewel of Tintagel; grand champion female, Brilliant Jersey Queen.

Graded herds—1, Thorp; 2, Hand; 3, Miller. Young herds—1, Miller; 2, Thorp; 3, Williams.

Calf herds—1, Miller; 2, Thorp.

Produce of cow (two)—1, Hand; 2, Thorp; 3, Williams; 4, Thorp.

Get of sire (four)—1, Thorp; 2, Miller; 3, Williams; 4, Hand.

(Other awards later.)

The dairy cattle awards were made by Hugh Van Pelt, editor of The Dairy Farmer, Waterloo, Iowa, in a manner thoroughly businesslike and to the satisfaction of all exhibitors.

THE SHOW OF SWINE

By B. S. Bennett

Seventeen breeders of Duroc Jersey swine from all parts of the state were exhibitors at the state fair.

It was their universal opinion that the show was the largest numerically, something over 200 head being shown, of any previous fair and showed a decided improvement as to the quality of the animals exhibited. The recent railroad strike was responsible for the absence of a number of good herds, but even this was no deterrent to the Winsor Ranch. Located a few miles from San Diego and being unable to ship by rail, the hogs were trucked to San Diego harbor, loaded by derrick onto the boat and came all the way to Sacramento by the water route, arriving just in time for the opening of the fair.

In the opinion of a number of breeders the outstanding feature of the Duroc Jersey show was the aged sow class, although the junior yearling boars had a number of supporters.

Previous to the judging this class was the most freely discussed, and many predictions as to the winner were made. This class included the $3000 Mammoth Sensation 2nd from the herd of Diamond Bar Ranch, Johnson's Defender, Jr., from Greenwood Farm, Freddy You'll Do, from the herd of J. E. Thorp and Natoma Defender from the Hazel Louise Farm. The three last named boars were all by the same sire, Johnson's Defender, the

Blackhawk Shires Win Again

At the recent California State Fair Shire horses bred, owned and exhibited by the Blackhawk Ranch won every first prize in classes entered. Anwick Arthur, at the head of our stud was made Champion Stallion and Blackhawk Chessie, was Champion Mare. Our exhibit called forth the remark from the Judge that few breeding establishments in America could show an equal class of Shires. For the best in Shires use Blackhawk breeding. We have a number of young stallions of serviceable age that we can offer at prices in keeping with their quality.

Blackhawk Shorthorns

Hold to the same high standard set by our Shires and while not shown at the State Fair they will be seen at the later shows. The herd has been carefully selected and founded on the most popular and proven Scotch families of the breed. Those in the market for bulls will be serving their own interests when they investigate this herd before buying.

Visitors are always welcome at the Ranch and correspondence is invited.

Holstein Cows for Cheese Making

They are large, vigorous, and easy to care for, and on coarse feed they produce a large quantity of milk of a quality especially desirable for invalids and infants.

Their great yield contains a higher total of fat than any other breed can produce, and in the cheese and condensary trade their earnings almost double those of breede whose milk capacity has been eacrificed to get a large percentage of fat. If interested in

last two being litter mates. With four such outstanding boars in the ring the judge immediately recognized the task cut out for him and examined each boar very carefully before making his decision. The final placing found Mammoth Sensation 2nd first, Johnson's Defender, Jr., second, Natoma Defender third and Freddy You'll Do, fourth. Johnson's Defender, Jr., was a strong contender for first honors and had the judge placed him first, his decision would have been unquestioned, although Mammoth Sensation boar was considered a little more typical of the breed as bred today. As strong as was this class the judge had to go into the aged boar class for the grand champion, placing his highest honor on Sensation Wonder 1st, shown by H. P. Slocum & Son. This boar was considered in a class by himself and deserving of top place. In the aged sow class the Winsor Ranch entry, Model Defender Lady, was so outstanding that all that remained for the judge to do was to select the winners for the four remaining ribbons. This sow was also made grand champion as she has been at all the other fairs where she has been shown. Coming to the senior sow pig class which many breeders asserted was the real sensation of the show, the Diamond Bar entry, the young sow Pathfinder's Very Best, has all the qualifications now demanded by the leading Duroc Jersey breeders and, meeting with no accident, she should develop into one of the most magnificent specimens of the breed yet produced.

Dwight C. Putnam of Tecumseh, Nebraska, did the judging and gave universal satisfaction.

The exhibitors were:

Exhibitors: L. J. Belknap, San Jose; W. V. Bennett, Nord; H. M. Berglund, Dixon; Jack Borge, Dos Palos; Joe N. Chinowth, Visalia; Henry Cummins, Visalia; Debban Brothers, Woodland; Diamond Bar Ranch, Spadra; El Dorado Duroc Breeders' Assn., Placerville; Elliott, Brant Rancho, Owensmouth; Fulgham & Sons, Visalia; F. Get of sire—1, Diamond Bar Ranch; 2, Thorp; 3, Winsor Ranch.

Produce of dam—1, Thorp; 2, Winsor Ranch; 3, Thorp.

Fat barrow—1, Diamond Bar Ranch.

Poland-Chinas

The Poland-China show at the state fair was considered by many of the breeders to be not only the largest but the most representative ever made. It consisted of nearly 300 animals selected from the herds of 21 breeders. Owing to the railroad strike a number of the prominent herds were unable to get to the fair. The judging arena was entirely too small to permit proper showing of the animals in a number of the classes, making it exceedingly difficult for the judge to work. Especially was this so in the junior yearling boar and sow, senior boar and sow and junior boar and sow classes.

The judging as a whole was fairly satisfactory.

The junior yearling boar class was the hottest contest of the show, 14 boars being driven into the ring. Considerably more time was spent by the judge in making these awards than in any other class. The winner was finally found in Chas. Gatewood's boar, Giant Bob, by Caldwell's Big Bob. This boar is typical of the breed as now bred by the leading Eastern Poland-China breeders, having a high arched back, plenty of length and depth, smooth and exceedingly large bone. He has plenty of size for age and if properly carried on until maturity will make an extremely large boar. This boar was later made grand champion. In the junior yearling sow class 20 head were driven in, and it is seldom that a show of this quality and number is seen at any state fair. This class caused a wider divergence of opinion than any other class in the show.

The blue was awarded to the Young & Clark's sow, Smooth Josie. McCarty and Starkweather produced the first prize, senior and grand champion sow in Big Mary 3rd by Big Fred. This sow is one of those long, deep, smooth motherly sows and was deserving of all the honors bestowed upon her.

In the senior boar pig class of 14, Fred Gatewood won first and reserve junior champion, while J. F. Lehman was placed first, second, third and fourth in a class of 28 junior boar pigs. It would be hard to find a more evenly balanced lot of young sows than those that made up the class of 22 senior sow pigs. This class also caused the judge considerable trouble before the winner was found in Nugget Nell, by Kansas King, from the herd of McCarty and Starkweather. The largest class of the show, 42 head, was that of junior sow pigs, J. F. Lehman winning first and junior champion on Lady King by Golden State King.

The largest individual winner was J. F. Lehman. Thos. Shattuck of Hastings, Nebraska, was judge.

The exhibitors were:

Exhibitors: M. & A. L. Bassett, Hanford; Geo. V. Beckman & Sons, Lodi; Buckland & Son, Fresno; J. H. Cook, Paradise; Cross Brothers, Merced; W. T. Dice, Hanford; L. E. DeForest, Susanville; Chas. Gatewood, Fresno; Fred Gatewood, Fresno; Johnnie Glusing, Winton; J. H. Hansborough, Modesto; N. K. Horan, Lockeford; Clyde Horr, Susanville; Robert W. Jickling, Elmira; J. F. Lehman, Lodi; Linderman & Robinson, Esparto; H. I. Marsh, Modesto; Marshall & Son, Sebastopol; McCarty & Starkweather, San Francisco; H. D. McCune, Lemoore; J. F. McSwain, Merced; Eugene Miner, Lodi; P. E. Mitchell, Atwater; Fred D. Ross, Hanford; C. A. Vaughn, Hanford; J. W. Wakefield, Acampo; W. A. Young, Lodi.

The awards follow:

Aged boar—1, Beckman & Son on Matchless Big Bob of U. F.; 2, Horan on Big Bone Bob; 3, Horan on Clark's Wonder.

Senior yearling—1, McSwain on Big Model Fellow; 2, Bassett on King's Timm; 3, Marsh on Big Model; 4, Jickling on Justo Bos; 5, Bassett on King's Gerstdale Jones.

Junior yearling—1, Gatewood on Giant Bob; 2, Elliott & Shinn on The Californian; 3, Young on Barton's Big Korver; 4, Young on Long Big Bone Jr.; 5, McCarty & Starkweather on King Jones Over.

Senior boar pig—1, Gatewood on Fresno Boy; 2, Glusing on King George Big Bone; 3, Bassett on Golden Model; 4, Bassett on J. B.'s Model; 5, Beckman on Governor.

Junior boar pig—1, Lehman on Big Bone Bob; 2, Lehman on Queen's King; 3, Lehman; 4, Lehman on Prince's Big Bone; 5, Bassett on Model Timm.

Aged sow—1, McCarty & Starkweather on Big Mary 3rd; 2, Bassett on Hopeful; 3, McCarty & Starkweather on Model Riverina; 4, Cook on Mollie Wonder 2d; 5, Horr on Katie Fisher.

Senior yearling—1, Cook on Forest View Bess; 2, Bassett on Big Model Maid; 3, Gatewood on Blue Valley B.; 4, Marsh on Wonder Alice 2d.

Junior yearling—1, Young on Black

Beauty C.; 2, Beckman on Belle's Beauty; 3, Beckman on Lady Wonder; 4, Young on Black Beauty 5th; 5, McCarty & Starkweather on Liberty Girl 3d.

Senior sow pig—1, McCarty & Starkweather on Nugget Nell; 2, Marshall & Son on Polly; 3, McCarty & Starkweather on Long Prospect; 4, Johnnie Glusing on Lady Washington's Model; 5, Bassett on Big Princess Model.

Junior sow pig—1, Lehman on Lady King; 2, Lehman on Lady Bob; 3, Bassett on Gerstdale's Best; 4, Gatewood on Polandale Bettie; 5, Cross Bros. on Letty C.

Senior champion boar, Gatewood on Giant Bob. Reserve, McSwain on Big Model Fellow.

Junior champion boar, Lehman on Big Bone King. Reserve, Gatewood on Fresno Boy.

Senior champion sow, McCarty & Starkweather on Big Mary 3rd. Reserve, Young on Black Beauty C.

Junior champion sow, McCarty & Starkweather on Nugget Nell. Reserve, Young on Black Beauty C.

Grand champion boar, Gatewood on Giant Bob. Reserve, McSwain on Big Model Fellow.

Grand champion sow, McCarty & Starkweather on Big Mary 3rd. Reserve, Young on Black Beauty C.

Aged herd—1, Young; 2, Beckman; 3, Bassett; 4, McCarty & Starkweather.

Young herd—1, Lehman; 2, McCarty & Starkweather; 3, Young.

Herd bred by exhibitor—1, Lehman; 2, McCarty & Starkweather.

Get of sire—1, Lehman; 2, McCarty & Starkweather; 3, Young.

Produce of dam—1, Lehman; 2, Young; 3, McCarty & Starkweather.

Chester Whites

The Chester White show at the fair this year, while not as large as that of other breeds, attracted considerable attention.

Six breeders made up the list of exhibitors, four of which were making their first show. C. B. Cunningham, one of the oldest and most prominent breeders, had the largest number of entries and won the largest share of the ribbons. Professor J. I. Thompson judged the classes.

The following were exhiibtors:

Exhibitors: C. B. Cunningham, Mills; L. P. Dorsey, Jr., Applegate; E. E. Fulton, Fair Oaks; Hiram Henderson, Fair Oaks; Mrs. L. M. Yore, East Auburn; R. L. Anderson, Placerville.

The awards follow:

Aged boar—1, Cunningham on Wildwood Boy; 2, Anderson on Big Sensation.

Senior yearling—1, Cunningham on Bonnie Model.

Junior yearling—1, Dorsey on Royal Wonder; 2, Yore on Ursa.

Senior boar pig—1, Cunningham on The Gambler; 2, Cunningham on Crescent Dick; 3, Yore on Merak.

Junior boar pig—1, Cunningham on Silver Top; 2, Cunningham on Silver Heart; 3, Yore on (unnamed); 4, Dorsey on Placer Boy; 5, Fulton on (unnamed),

Senior champion boar, Cunningham on Wildwood Boy.

Junior champion boar, Cunningham on The Gambler.

Aged sow—1, Cunningham on Billiken Belle; 2, Henderson on Wonder Bernice; 3, Cunningham on Lady Lenora; 4, Yore on Mary Lou.

Senior yearling — 1, Cunningham on Emily Wing; 2, Dorsey on Myra's Girl; 3, Yore on Myra 2d.

Junior yearling—1, Henderson on Betsey Wonder; 2, Cunningham on White Queen 2d; 3, Yore on Molly O.

Senior pig—1, Cunningham on Echo; 2, Cunningham on Miss Creation; 3, Cunningham on Irma; 4, Cunningham on Grace; 5, Yore on Tania.

Junior pig—1, Fulton on (unnamed); 2, Cunningham on Silver Patria; 3, Cunningham on Silver Paula; 4, Dorsey on Lucy M.; 5, Yore on (unnamed).

Senior champion sow, Cunningham on Billiken Girl Junior.

Junior champion sow, Cunningham on Echo.

Aged herd—1, Cunningham; 2, Yore.

Young herd—1, Cunningham; 2, Fulton; 3, Cunningham.

Herd bred by exhibitor—1, Cunningham; 2, Cunningham; 3, Yore.

Get of sire—1, Cunningham; 2, Cunningham.

Produce of dam—1, Cunningham; 2, Dorsey.

Fat harrow any age—1, Cunningham; 2, Cunningham.

Pen of barrows—1, Cunningham.

Grand champion boar, Cunningham. Reserve, Cunningham.

Grand champion sow, Cunningham. Reserve, Cunningham.

THE BERKSHIRE SHOW AT THE CALIFORNIA STATE FAIR

By W. S. Guilford

Another creditahle showing of Berkshires was made at the 1919 California state fair. About 100 head were shown, and not a poor one in the lot. Hogs were shown by 14 exhibitors; several of them represented for the first time.

Wyman N. Lovejoy of Roscoe, Illinois, a judge of national reputation, judged, and his work was satisfactory to all, breeders and ringside talent alike being pleased with his placings. He goes over the entries carefully but awards the ribbon quickly, a feature that gives satisfaction to spectators, exhibitors and the animals in the ring. There has never been a judge of any breed on the California state fair grounds who did a better joh tban did Mr. Lovejoy. "It is better than the show at the Illinois state fair and a credit to the breed. As good Berkshires are bred and developed on the Pacific Coast as are grown in the world," he said.

Prices were divided among many exhibitors. It seems impossible for any one or two herds to annex all of the ribhons in Western Berkshire shows, and this feature adds interest to every Berkshire exhibition. A dark horse from a new breeder is apt to show up at any time and claim distinction.

The Western Berkshire prizes for new hreeders making higgest winnings went first, Muddox; second, J. A. Parker; third, Italian Vineyard Co.; fourth, S. A. Brittain; fifth, Fair Oaks Ranch. Prizes for the hest boar and sow bred hy exhihitor went to Sandercock and Humphrey on their grand champion. In the aged boar class Rincon Leader, a son of Grand Leader 2nd won for Muddox. He is a hig, long-bodied, stretchy one with lots of hone, a fine upstanding kind of a boar. He was not in high flesh, just in breeding condition. The second prize aged hoar, Grape Wild Emblem, a son of Solano Emhlem, is a thick, low set one, the best fitted and conditioned boar in the ring. He is not only wide hut long and has a splendid short, wide head. The Murphy boar, Wilsonia King Laurel is a very pleasing type. He is good all over and would not be out of place at the head of a ring. Frank B. Anderson's hoar, Ideal Royal Lee, was shown "in his working clothes." He has splendid feet and legs and lots of length. The fifth prize hoar was another good one, not highly fitted, but in splendid breeding condition. His owner, G. F. Donsing of Rio Linda, is a new man in the Berkshire husiness. Two senior yearling hoars were shown, both sons of Royal Superbus. The Humphrey hoar was placed first—but hoth are thick, long and meaty.

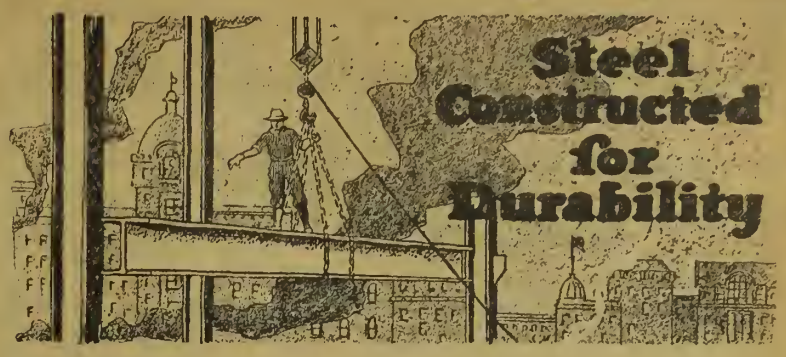
The junior yearling class hrought out the grand champion of the show, one of the best Berkshires that has ever been produced on the Pacific Coast. He is long, smooth, even, has a wonderful arched back, a short, wide head, the best of legs and feet and he is a real big type Berkshire. He was sired by Baron Duke 201st. Natomas Baron Duke was selected by Mrs. E. A. Hardy and Ruland Hardy as the kind of a hoar needed in the Anchorage Farm herd at Orland and was purchased from Mr. Sandercock for $1,000. He goes to one of the best herds in America. The Italian Vineyard Company of Guasti, near Los Angeles, presented a splendid boar in this class. Their first show at Sacramento was a very creditable one, and Choice Goods is a well fitted boar, wide and thick and carrying a full, well rounded ham. S. A. Brittain showed another long, stretchy "big type" son of Baron Duke 201st in third place. A good son of Epochal, deep and long and mellow, but not highly fitted,was placed fourth for H. S. Teesdale of Nevada, another breeder showing at this fair for the first time. The Anderson boar, Natomas Royal Lee, by Ideal Royal Lee, that was placed fifth, was in hreeding condition and not fitted enough for a higher placing.

There were six entries in the senior boar pig class. Humphrey had first and second on two sons of Majestic King 6th. They are long bodied thick ones and well grown. Castleview Ranch, owned by J. Francis O'Connor, was third on a good one by Ames Rival 102d. H. C. Muddux & Son had fourth and fifth on the two good sons of Mayfield Rookwood 2nd.

Eleven junior boar pigs kept the judge busy in the small ring, but he soon placed first and second on two sons of Big Type, shown by Humphrey. Another good son of Mayfield Rookwood 2nd was third for O'Connor, a well grown one, and an even smooth fleshed pig. O'Connor is producing some of the best stock grown anywhere and is a developer of Berkshire trade second to none. Muddox had fourth and fifth on two very fine sons of Rincon's Leader.

The aged sow class at the California state fair is always sensational. This year was no exception. Any one of the 12 splendid animals shown are worthy a place in the best herds in the world, and to be outside the money was no disgrace. Mr. Lovejoy expressed himself as being very much pleased with the first prize sow, Grape Wild Rose,

Conitnued on Page 354



The ACME Cutter

The Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine

When a piece of steel is set in place, securely riveted and hraced as in the frame of the Acme, it "stays put."

The frame cannot "settle" nor the boxes come out of alignment and cause hot bearings.

Steel has made it possible to build the Acme lower so that it can easily be controlled while standing on the ground; to set the blower inside the frame, thereby strengthening that important part and to turn out a machine that is more generally efficient in every way and with a lower upkeep cost.

In other words, you will find the Acme to he the sturdiest, strongest huilt, most durable and dependable ensilage cutter you can buy.

Catalog and sample of meal mailed free upon request.

DE LAVAL DAIRY SUPPLY CO.

61 Beale St., San Francisco

Dispersal Sale Ayrshires

At Public Auction
State Fair Grounds
Sacramento, California
Tuesday, Sept. 16, 1919

This will be a complete dispersal sale of the herd of registered Ayrshires owned by Preston School of Industry, Ione, California, which was founded some years ago with females selected from some of the best known herds in the United States and Canada. These females have been bred to high class bulls of the breed, and in addition to the many good young cows there are many very desirable bred and open heifers, and heifer calves.

60
Registered Cows, Heifers and Bulls

will be approximately the total number in the sale, and besides the females mentioned above there will be the two herd bulls, and several others ready and nearly ready for service. Among them are several that should be attractive to breeders, while dairymen will find a good selection of young bulls.

Every animal guaranteed to be a breeder; every animal over six months old tuberculin tested.

SALE STARTS PROMPTLY AT 10 A. M.—CATALOG ON REQUEST

Dairymen---Farmers---Livestock Breeders

It pays to put a sire of character and individuality and an animal that will reproduce himself at the head of your herd. I have always believed it. The history of livestock breeding shows it. But this year, my winnings at the California State Fair proved it conclusively.

The Giant fifteen months old Berkshire boar, Natomas Baron Duke, was the grand champion of the show. He was pronounced by Judge Wyman Lovejoy of Roscoe, Illinois, as one of the best individuals he ever had seen. Immediately after the show Ruland and Mrs. E. A. Hardy, Manager of Mark Requa's Anchorage Farm at Orland, purchased the winner from me for $1,000.00. He has found a home in a herd of splendid foundation sows.

Natomas Baron Duke is the son of Baron Duke 201st—my herd sire, who was Grand Champion at the Omaha National Swine Show. The blood that he carries is the result of thirty years of constructive breeding by the greatest of all breeders, Nick Gentry. Natomas Baron Duke's dam was Natomas Rookwood, on my farm and rebred to Baron Duke 201st, a sow of royal breeding, in the pedigree of which are to be found many prize winners at shows all over the United States.

To breed hogs that will return the most profit to the dairyman or farmer you must have outstanding sires to cross on your grade or scrub sows. The new or old breeder must also have outstanding sows if he is going to breed prize winners.

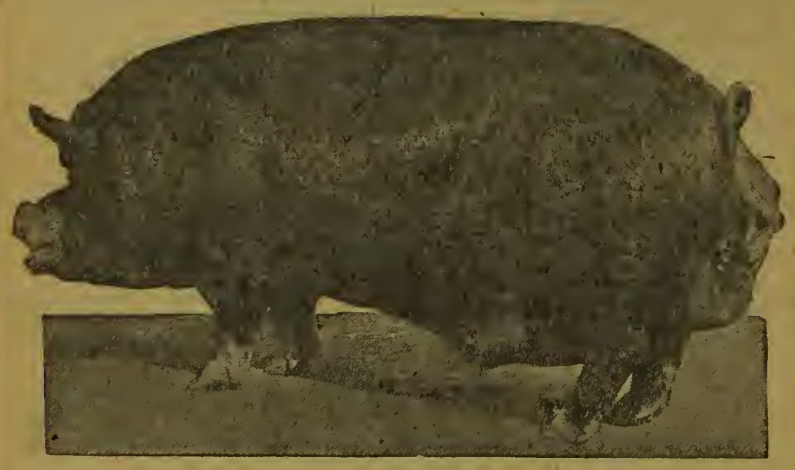
There is more world and national championship blood in my herd of sows than any other herd in the world. A big statement, but true. My sows have been selected regardless of cost, first for excellence of the individual, second on their record as producers of big litters of large, easy feeding pigs—third on their breeding and show record.

Only 600 and 700 pound sows that will farrow twice a year and raise at least seven pigs of each litter are retained in the herd.

This was my first year to show animals actually bred and raised on my farm, yet Baron Duke 201st's offspring won the following prizes: On Boar, Grand Champion, Senior Champion, First Junior Yearling.

Sows: First Junior Yearling, Reserve Senior Champion, Reserve Grand Champion, First Junior Sow Pig and many other lesser prizes.

The three most important prizes are Grand Champion Boar, Aged Herd (three sows and boar) and Get of Sire (three sows and boar), all of which were won by me with Baron Duke 201st pigs.



Baron Duke 201st No. 200001
Grand National Champion, The Sire of Champions

A new folder printed just prior to this Fair and now ready for free distribution to those interested has many pictures of my hogs and gives much detailed information about my Berkshire Herd. The following are excerpts from this folder giving the opinion of the man who bred and raised my 780-pound herd sire, Baron Duke 201st, the $1,100.00 Grand National Champion:

"If Baron Duke 201st is not a good one, I am no judge. His smooth shoulders, great back, width and hams, together with splendid bone and feet, should be appreciated by any judge. I never saw a better width of loin than he has. If more breeders would produce the type of BARON DUKE 201st, there would be many more Berkshires raised and sold. The fact that as good a judge as W. E. Spicer made Baron Duke 201st Grand Champion at the National Swine Show is proof of his superior quality, and there are a good many other leading breeders of the same mind. Every animal on both sides in pedigree of Baron Duke for many generations back was a good one—every one of them. His size, his heart girth, his very smooth shoulders, his back and loin, legs and feet are hard to equal in one animal. If he is not a good one and a well bred one, there is no other. I am glad to give you my opinion of Baron Duke 201st."

N. H. GENTRY, Sedalia, Missouri.

Judge W. E. Spicer said after the National Swine Show:

"Baron Duke 201st is the old-fashoined kind that farmers must have and will have, and will do his part to put Berkshires on every farm."

Wyman Lovejoy, the judge at the 1919 State Fair, said: "I was particularly impressed with the good, heavy bone, great size, spring of rib, large hams, easy feeding characteristics and the uniformity of Baron Duke 201st pigs. They would be hard to beat in any show ring."

The Grand National Champion Baron Duke 201st—the sire of Champions—and his winning daughters are on my ranch and there are a hundred of his sows and boar pigs ready to go into your herd or onto your ranch and help your hogs to gain more meat on the same amount of feed. The prices are no higher than those asked for ordinary pure bred hogs. All of the hogs are immunized for life, with Purity Serum and Mixed Vaccine, against cholera. A letter will bring tho new folder and any Borkshires that you might purchase must be entirely satisfactory or they must be returned at my expense.

W. F. Sandercock

Sandercock Land Co. 23 Montgomery St. San Francisco, Cal.

In Charge of Natomas Land Sales

THE CAROB AS A STOCK FEED

Some owners of hillsides of comparatively waste lands have been interested in the carob as a possible live stock feed producer, and questions continue to come to this office regarding its value and the feasibility of planting, especially on these waste lands. We may say that some are so enthusiastic that they think even a medium priced land could be used, but this would probably not be the general belief, at least not until years of production show what the carob tree will do. It must be borne in mind that the bean, or St. John's bread, varies greatly in sugar and protein content, that is, it seems to be necessary to plant only grafted or budded trees in order to secure bearers of a high quality product.

Fred K. Howard, when still horticultural commissioner of Kings County, secured a fund of information regarding the carob and its feeding value. From that portion of his report touching upon its value we quote:

"Horses, cattle, sheep and hogs take readily to the pods, and turkeys soon learn to fly into the tree, tear off the pods, break and eat them. Chickens will readily feed on the pods when broken up. The carob is the main forage for the English cavalry horses in Malta and for the tram horses in Naples, while it is a common sight to see the London cabby give his horse a feed of the brown pods while waiting for a customer. The Island of Cyprus grows large quantities of this forage and it constitutes its largest export. The carob is a splendid avenue tree, and hundreds of California farmers could add very materially to their forage supply by planting these trees where shade and ornamental trees are desired.

Feeding Value

"Dr. F. W. Woll, professor of animal nutrition, University of California, at the Davis Farm, carried on a feeding test with calves. One bunch of calves received as their grain portion, ground milo and ground barley, half and half; the other bunch received an equal amount of crushed carob pods and ground milo, half and half. This experiment extended over a period of 13 weeks, and at the close of the period those fed on milo and barley had averaged a gain of 1.70 pounds per day; while those fed on carob pods and milo averaged 1.81 pounds. Those fed carobs required more hay than the others so taking it altogether, the carob showed values equal to ground barley.

"The seeds come readily. By planting the seed pods on edge, close together in a sprouting box, with a slight covering of soil there will be a succession of seedlings covering two or three years. This method seems to protect the young seedlings from the damping off fungus that otherwise causes a great loss in plants. There seems to be a ferment in the pod that protects the early growth. Seeds stripped from the pod and treated with hot water come quickly, but these young plants are very susceptible to the damping off fungi.

"Eighteen degrees of frost will not injure the carob to any extent. Frost conditions that did marked damage to citrus trees made no impression on carobs growing within a few feet of them.

"And what more can be said? Do we advocate planting carobs instead of grains? Shall we plow up our alfalfa and put in this thrifty tree? Are we proposing to revolutionize present good systems of farm procedure? Not at all. But we do urge and expect that the good sense of those who may read this will induce some of them to make a respectable planting of the tree in places where now there is small return and watch the development."

LEGUMES A SUBSTITUTE FOR GRAIN

That profits may sometimes be increased by the substitution of legumes for a large part of the concentrates in the dairy ration is brought out by cow testing association records obtained by the dairy division of the Unitcd Statos department of agriculture. The records from six associations where alfalfa formed a large part of tho dairy ration were compared with the records from eight associations where legumes were fed sparingly with the following results:

In the alfalfa district the cost of grain was 16 per cent of the total feed cost, and in the other district the cost of grain was 41 per cent of the total feed cost. The average milk yield of the alfalfa-fed cows was 6805 pounds and the average yield of butter fat was 281 pounds. In the other district the average milk yield was 5234 pounds and the average yield of butter fat was 238 pounds. For the alfalfa-fed cows the average inoome over cost of feed was $73 and for the grain-fed cows the average income over cost of feed was $37.

The alfalfa fed cows may have been better cows and the climate may have been better adapted to dairying, but as both districts are favorably known for their dairy products it may be assumed that the cows were of good quality and well cared for in both districts. It seems fair, therefore, to conclude that the higher production and greater income above feed cost of the alfalfa-fed cows was due largely to the feeding of home grown legumes. In any case it is well worth while for the farmers in one district to study the feeding practices of other districts. If legumes add to net profits, why not grow and feed more legumes? If the soil is not adapted to legumes it may pay to add lime or manure or whatever else it lacks in order that the dairy herd may be supplied with an abundance of home grown legumes.

ARIZONA STOCKMEN WANT GRAZING LANDS UNDER FEDERAL CONTROL

Fifteen years ago the forest service of the United States department of agriculture tackled the big job of administering the national forest area. This area contained much of the finest grazing land in the country. Naturally its administration brought up many questions which incited tho discussion and often times criticism of the stockmen. The newness and the vastness of the enterprise naturally at the beginning resulted in many mistakes while the big forestry grazing policies were being evolved.

Stockmen of 13 western grazing states met in conference in Salt Lake City recently and a resolution was passed, almost uanimously, asking congress to provide for administration by the United States department of agriculture of all public lands of the country after somewhat the same fashion as the forest service is now administering grazing land within the national forests.

During the Southern Arizona tour of the live stock squad of the agriculture extension service of the University, cattlemen were interviewed all along the line to obtain their viewpoint on this question. Only one of some score of large or moderately large cattle outfits, where the owner or managers were interviewed, expressed opposition to federal control of the public grazing lands. This is a splendid vindication of the forest service grazing policy.

FOR CURING MEAT

Ten quarts of salt.
Three teacups of black pepper.
Three tablespoons cayenne pepper.
Five pounds cane sugar.

Put in a large pan and heat, stir and mix thoroughly while warming. Then take this mixture to where you are going to pack your meat. Take one joint at a time and put it in the pan, rub salt mixture on well. Use only clean boxes or clean salt barrels. This amount is for ten hogs, weight from 250 to 275 pounds.

Four weeks are long enough for the sides and five to six weeks for the joints to remain in salt before taking up. Now have a kettle of boiling water ready; dip each piece of meat in it and lay on a table to dry. When thoroughly dry, rub with powdered borax and black pepper, oqual parts. Your meat is now ready to smoko.

Clean cobs, or hard wood is the best thing to smoke meat with. Be sure and put one to two tablespoons of sulphur on tho smoke fire once each day.

Why dream of the future when you can grab right hold of the forelock of today and ride anywhere?

HOW

The Paraffine Companies Inc. helped develop the oil and asphalt industry of California

The tremendous growth of the oil and asphalt industry of California was due in a measure to The Paraffine Companies, Inc.

How?

"Black Paraffine" Apparently Worthless

In the early days, oil experts from the Pennsylvania fields, thought that the black viscous residue left after the lighter oils had been distilled from California petroleum was "black paraffine." But it was not like the paraffine they knew, and they considered it worthless.

For a long time the oil industry was handicapped by the large quantity of this black residue.

Its Great Value Discovered

Then came Beardsley, an Eastern oil expert, and Pierce, a chemist, who resolved to find a use for it. They experimented ceaselessly without result, until one day by accident they discovered that this "black paraffine" would dissolve readily in that evil-smelling liquid known as carbon bisulphide. Their search was at an end. They had made a paint which dried quickly and withstood the action of acids and alkalis.

As a result of this discovery The Paraffine Paint Company was formed to manufacture the now famous "P & B" paints and a small plant was established in Oakland in 1884.

Oil Was Distilled to Get the Asphalt

During the early life of The Paraffine Paint Company there was difficulty in securing enough "black paraffine," or what was later discovered to be asphalt. The oil companies had trouble in supplying it, because it forced them to distill a large quantity of the lighter oils in order to get the residue. And, they stated, there was little or no market for the distilled products! Thus, for a time, asphalt was the main product and the lighter oils the by-products. A curious situation in the light of present-day conditions.

Growth of The Paraffine Paint Company

Through the company's success in making paint, other uses for asphalt were sought and found, and it gradually extended its business. New products were brought out from time to time, such as "P & B" roofings—the original ready roofing—building papers, specialty paints and wall-board, and later, floor coverings.

The Paraffine Companies, Inc., Organized

Built upon a solid foundation and a policy of high quality always, the Company grew and expanded until in November, 1917, The Paraffine Paint Company with other companies was merged into The Paraffine Companies, Incorporated. Today this organization is one of the largest industrial concerns in the West and the products of its fourteen great plants are distributed throughout various parts of the world.

Everybody on the Pacific Coast who has ever had anything to do with building construction knows the names of the "P & B" products, Malthoid and Ru-ber-oid Roofings, as the standards of ready roof

MONEY MAKING HOLSTEINS
AT PUBLIC AUCTION

Registered Holsteins are harder to buy today than they have been before in many years, for never before have owners been holding on to what they already have as closely as they do now, because of the more substantial basis upon which the dairy industry is being placed all over the country.

HENDERSON COMPANY, Sacramento, Calif., now have a herd of registered Holsteins numbering 333 head, which is about the present capacity of their ranch, and they are therefore now in position to offer good breeding stock regularly.

BONITA STOCK FARM, Lodi, Calif., the property of J. M. Henderson, now has 160 registered Holsteins in its herd, which is also about the capacity of the farm, and surplus breeding stock will be sold from this herd regularly.

These two herds will be represented in a combination sale at public auction of

65 Registered Holstein Cows, Heifers and Bulls

Stockton, Calif., Thursday, September 18, 1919

Every female in this sale that is of breeding age, and practically all of them are, either fresh or heavy in calf to a high class bull. A very large number are bred to King Pontiac Segis Inka, whose offspring were winners at the recent State Fair; King of the Black and Whites, the famously bred bull who has more A. R. O. daughters than any other bull on the Pacific Coast; King Lillian Walker Segis, son of King of the Black and Whites; and Supreme Glista Pietje, the richly bred bull that sired the junior champion bull at the California State Fair this year.

Consider The Worth of Their Calves

Both herds are selling some splendidly bred and high producing cows and heifers, many with official records. There is no reasonable doubt that many of them will sell for less than their calves will be worth by these great sires. It is therefore an opportunity that can hardly be overestimated for the purchase of foundation animals at modest investment.

BULLS IN THE SALE

The sale will include MODEL DOMINO GLISTA, who was first prize two year old at this year's State Fair, a splendid individual of excellent breeding. A very desirable selection of young bulls will be offered, with the breeding and type that will breed quality into the best dairy herds. They are all in good condition and many are about ready for service.

Every animal guaranteed to be a breeder

No animal in sale tuberculin tested

Sale will be held at DARBY'S BARN, corner Pilgrim and East Lafayette Streets, Stockton, California, Thursday, September 18, beginning promptly at 10:00 o'clock A. M.

50 Registered Holsteins 50
at Public Auction

Having leased their ranch, Agee Bros. will sell at public auction 50 registered Holstein cows, heifers, and bulls, at

Holtville, Imperial County, California
Wednesday, October 8, 1919

This is a well bred offering, and the females are practically all in calf to the richly bred bull Toyon Fayne Valdessa, who is by the 41 pound bull King Valdessa and out of a 30 pound 4 year old daughter of King Hengerveld Aaggie Fayne.

The offering of bulls is an excellent one, and should be particularly attractive to dairymen in Imperial and other southern counties, for it is not often that so desirable a lot is offered at auction so close to home.

Catalog in preparation. A copy free on request.

THE BERKSHIRE SHOW

Continued from Page 351

afterward grand champion. She is a daughter of Grand Leader 2nd and just fills the eye of anyone looking for Berkshire perfection. She is big and has lots of quality. She is long, has widely sprung ribs, deep side, a wonderful ham, the best of feet, plenty of bone, and everything else a grand champion sow should have. Another, Grand Leader 2nd, sow of the same kind was second, and a sister to Barkers Real Type was third. The fourth prize went to Daisy Lee 11th shown by Fair Oaks Ranch. Sandercock had fifth on a smooth evenly turned daughter of Ames Rival 100th, a well fitted show sow, not so large as some of the others.

Four senior yearling sows were shown. Humphrey had first and second on daughters of Royal Superbus; Muddux was third on a real show sow that at the close of the fair was raising ten pigs. O'Connor had fourth on a daughter of the Rival Champion boar brought to the Coast some time ago by A. W. Foster, and Muddux was fifth on a daughter of the same boar. There were seven junior yearlings—and the class was headed by Dukes Natomas Princess, a daughter of Baron Duke 201st, that was afterward made junior champion and reserve grand champion. This sow is big and long and has lots of quality. Humphrey had second on a daughter of Solano Emblem, third on a daughter of Humphrey Grand Leader and fifth on a Fashion Longfellow 27th sow. Another Baron Duke 201st sow was fourth for Sandercock.

There were 16 entries in each of the sow pig classes. In the senior class O'Connor had first and junior champion on a daughter of Iowana Rival Champion 4th, Humphrey had second and reserve junior champion on a Big Leader pig.

A number of pig clubs were shown in the junior class. Both of these classes were very creditable.

O'Connor showed the winning barrow, a pig sired by his boar, Mayfield Rookwood, the sire of the champion barrow at the 1919 Berkshire congress.

The awards follow:

Aged boar—1, Muddux on Rincon Leader; 2, Humphrey on Grape Wild Emblem; 3, Murphy on Wilsonia King Laurel; 4, Anderson on Ideal Royal Lee; 5, Donsing on Ames Rival Natomas.

Senior yearling—1, Humphrey on Escalon Superb; 2, Barker on Escalon Grand Royal 2d.

Junior yearling—1, Sandercock on Natomas Baron Duke; 2, Italian Vineyard Co. on Choice Goods 10th; 3, Brittain on Barrows Baron Duke; 4, Teasdale on Nevada Epochal; 5, Anderson on Natomas Royal Lee.

Senior pig—1, Humphrey on Escalon Type; 2, Humphrey on Escalon Type 2d; 3, Castleview Ranch on Castleview Rival 2d; 4, Muddux on Meadowview Rival; 5, Muddux on Wiesendenger Prince.

Junior pig — 1, 2, Humphrey on unnamed pig; 3, Castleview Ranch on Castleview Rival Duke; 4, Muddux on Meadowview Rival 3rd; 5, Muddux on Meadowview Rival 2nd.

Aged sows—1, Humphrey on Grape Wild Rose; 2, Humphrey on Leader's Jeannette 2d; 3, Sandercock on Wilsonia Princess Laurel; 4, Fair Oaks Ranch on Daisy Lee 11th; 5, Sandercock on Live Oak Laurel.

Senior yearling—1, 2, 3, Humphrey on Escalon Blue Belle, Royal Polly 2d, Live Oak Belle; 4, Castleview Ranch on Hopland Iowana Princess 4th; 5, Muddux on Hopland Grand Lady.

Junior yearling — 1, Sandercock on Duke's Natomas Princess; 2, Humphrey on Emblem's Escalon Belle; 3, Humphrey on Grape Wild Rose 3rd; 4, Sandercock on Baron Duke's Princess 11th; 5, Humphrey on Escalon Majestic Fashion.

Senior pig—1, Castleview Ranch on Premier Belle; 2, 3, Humphrey on Grape Wild Rose 6th, Leader's Artful Bell 8th; 4, 5, Muddux on Meadowview Duchess 4th and Meadowview Duchess.

Junior pig—1, Sandercock on Double's Duchess; 2, Castleview Ranch on Castleview Rival Duchess; 3, 4, Humphrey on Grape Wild Rose 8th, Escalon May 11th; 5, Sandercock on Natomas Symboleer Belle.

Senior champion boar, Sandercock on Natomas Baron Duke. Reserve senior champion boar, Muddux on Rincon Leader.

Junior champion boar, Humphrey (unnamed). Reserve, Humphrey (unnamed).

Senior champion sow, Humphrey on Grape Wild Rose. Reserve senior champion, Sandercock on Duke's Natomas Princess.

Junior champion sow, Castleview Ranch on Castleview Premier Belle. Reserve junior champion sow, Humphrey on Grape Wild Rose 6th.

Grand champion boar, Sandercock on Natomas Baron Duke. Reserve grand champion, Muddux on Rincon Leader.

Grand champion sow, Humphrey on Grape Wild Rose. Reserve grand champion sow, Sandercock on Duke's Natomas Princess.

Aged herd—1, Sandercock.

Young herd—1, Humphrey; 2, Sandercock; 3, Castleview Ranch; 4, Muddux.

Herd bred by exhibitor—1, 2, Humphrey; 3, Sandercock.

Get of sire—1, Sandercock; 2, Humphrey; 3, Muddux; 4, Castleview Ranch.

Produce of dam—1, Muddux; 2, Humphrey; 3, Sandercock; 4, Castleview Ranch; 5, Anderson.

THE SHORTHORNS

By R. P. Royce

Four herds of Shorthorns, two making their initial show at Sacramento, staged one of the best shows seen in recent years. There have been shows where more herds were represented, but few shows have brought together such a uniformly good lot of cattle as were placed before Judge Burns. The judging was postponed until Wednesday out of courtesy to the Dibblee herd, delayed on account of the strike. It was the initial show of this firm at the state fair. Their arrival added strength to the show.

Only one aged bull was shown. Hallwood Flash from the Dibblee herd was presented in splendid condition. He has done well since the show at Los Angeles last December and there was little opposition to him for senior champion until he was stopped at the top by his young stable mate.

The two two year olds were rated as they stood at Los Angeles last year, the white Pacheco Marshall, from the Pachcco herd, winning over the roan Matchless Elite shown by Glide. The white bull is smoother in his covering than the Glide entry, especially is he smoother at the tail, but he is scarcely so thick. His more attractive head added to the margin he held over the second bull.

The senior yearling class furnished the junior and grand champion in the Dibblee entry, the white Basham Augusta, junior champion as a calf at Los Angeles last fall. This youngster has come on wonderfully and his pleasing front, straight lines and remarkable smoothness and quality carried him through to the top. He is not as highly fitted as the Pacheco entry that stood second over a bull from the Glide herd, but is wider on top.

Wm. Bond, showing for the first time, won the junior yearling class with Cumberland Gloster. Pacheco Lad 145th was second with more size and a more attractive front than the winner but he was not so even on top or at the tail head nor was he as strong in the heart.

The four senior calves were headed with the red, Cheerful Count, shown by Glide. He is a calf of even balance, quite smooth in his covering and particularly better in his flank than Pacheco Cumberland in second place with more scale. The two Dibblee entries were calves of different type from the two ahead of them, both being put up on shorter legs. The third calf was a soggy youngster but was rather plain in his rear conformation. The Pacheco and Glide junior calves divided honors and were placed as named.

Glide showed the only aged cow, Spicy Lady, a white, of beautiful character, level on top, thick and very smooth. She is the sort that can stand a lot of competition.

The five two year olds constituted one of the strongest classes of the show and brought out a line-up that would look well most any place. There was slight question as to the top, furnished by Glide in Little Sweetheart, regarded by many as one of the best Shorthorn females ever seen at Sacramento. She is a beautiful red, with a bit of white, and from front to rear is hard to fault. Front with a head combining character and sweetness set on a neck that blends into the shoulders almost faultlessly, extremely wide and thick in the crops and along the back and with exceptional depth, she carries her width fore to aft and down into her quarters to a degree rarely seen. Barring a slight roughness about the tail she is not to be criticized.

The Pacheco entry in second was Pacheco Lass 118th, a winner at last year's fair. She would have looked well at the head of a class with a top less outstanding. She was somewhat handicapped by reason of the fact that she is raising a calf which accounted for her plainness behind as compared with the winner. She looked well above the light roan Dibblee entry, heavy in calf and scarcely so thick, but quite smooth and sweet in front. Bond was third with Mayfield Victoria, hardly so large and a bit harsh to the touch. Pacheco was fifth with a roan

of scale, but lacking the levelness, quality and character of those above her.

The senior yearlings, with four showing, met strong competition in the thick, well balanced, light roan shown by Glide. Dibblee Estate had the three remaining places. The second heifer, a red, had more size than the winner, but was not so strong on top. The third calf had an easy time annexing her place.

Glide was again at the front in the junior yearling, with a thick roan heifer that was not so smooth as the attractive red shown by Bond but with more size. Pacheco was fourth, Dibblee fifth.

With nine senior heifer calves, Judge Burns did an artistic job of rating. He found his top in the outstanding white calf shown by Pacheco, a lovely little lady that was a regular block of meat, yet sweet and well balanced with a hide a trifle thick. Dibblee was second with a smooth light roan of good lines, lacking a bit in character. Pacheco was third with a rich coated roan. Glide was fourth and another Pacheco entry was fifth and one from the Dibblee herd sixth.

The three juniors had a Glide entry in first place, Pacheco second and Bond third. The awards follow:

Exhibitors: Alexander & Kellogg, Suisun; Leon F. Douglas, San Rafael; Thos. Harrison, Santa Rosa; C. A. Murphy, Perkins; Chas. L. Weaver, Tulare.

Aged bulls—1, Harrison on Foothills Pioneer; 2, Harrison on Daisy's Lad.

Two year olds—1, Alexander & Kellogg on Westward Ho; 2, Weaver on North Star.

Junior yearlings—1, Murphy on Mary's Chief.

Senior bull calves—1, Harrison on Count Tickford; 2, Murphy on Frantic Chief 2d; 3, Weaver on The Westerner.

Junior bull calves—1, Harrison on Brighton Gloster; 2, Alexander & Kellogg on Innisfail Favorite; 3, Douglas on Pedro Forrest; 4, Alexander & Kellogg on Innisfail Hettie; 5, Alexander & Kellogg on Kelmscott Charles.

Senior champion bull, Foothills Pioneer.

Junior champion, Count Tickford.

Grand champion, Foothills Pioneer.

Cow having official record—1, Alexander & Kellogg on Bellevue Daisy; 2, Alexander & Kellogg on Carperby Dairy Maid 2d.

Dairy Herd—1, Alexander & Kellogg.

Aged cows—1, Alexander & Kellogg on Lady Beatrice; 2, Alexander & Kellogg on Bellevue Daisy; 3, Harrison on Naomi 2d; 4, Weaver on Idlewood 12th.

Two year olds—1, Alexander & Kellogg on Carol; 2, Alexander & Kellogg on Alma.

Senior yearlings—1, Harrison on Glen Dorothy; 2, Harrison on Welfare's Belle; 3, Alexander & Kellogg on Annabel; 4, Alexander & Kellogg on Rose Fairfield.

Junior yearlings—1, Harrison on Rose Duchess 2d; 2, Alexander & Kellogg on Innisfail Dairymaid; 3, Alexander & Kellogg on Roan Lily; 4, Weaver on Bonnie May.

Senior heifer calves—1, Harrison on Santa Rosa Queen; 2, Alexander & Kellogg on Valley Belle 6th; 3, Alexander & Kellogg on Beggar Maid's Beauty 2d; 4, Harrison on Wild Eyes Princess 4th; 5, Harrison on Lady Christiana 12th.

Junior heifer calves — 1, Harrison on Frantic Beauty.

Senior champion cow, Lady Beatrice; junior champion, Glen Dorothy; grand champion female, Lady Beatrice.

Graded herds—1, Alexander & Kellogg; young herds—1, Alexander & Kellogg.

Produce of cow (two)—1, Alexander & Kellogg; 2, Alexander & Kellogg.

Get of sire (four)—1, Alexander & Kellogg; 2, Alexander & Kellogg.

Exhibitors: T. S. Glide, Davis; Estate of Thos. Dibblee, Lompoc; Pacheco Cattle Co., Hollister; Wm. Bond, Newark.

Aged bulls—1, Dibble Estate on Hallwood Flash.

Two year olds—1, Pacheco Cattle Co. on Pacheco Marshall; 2 Glide on Matchless Elite.

Senior yearlings—1, Dibblee Estate on Basham Augusta; 2, Pacheco Cattle Co. on Dalmeny Count; 3, Glide on Hillcrest Amaranth.

Junior yearlings—1, Bond on Cumberland Gloster; 2, Pacheco Cattle Co. on Pacheco Lad 145th.

Senior bull calves—1, Glide on Cheerful Count; 2, Pacheco Cattle Co. on Pacheco Cumberland; 3, Dibblee Estate on Baron Lancaster; 4, Dibblee Estate on Orange Villager.

Junior bull calves—1, Pacheco Cattle Co. on Pacheco Barmpton; 2, Glide on Spicy Count.

Senior champion bull—Hallwood Flash.

Junior champion—Basham Augusta.

Grand champion—Basham Augusta.

Aged cows—1, Glide on Spicy Lady.

Two year olds—1, Glide on Little Sweetheart; 2, Pacheco Cattle Co. on Pacheco Lass 118th; 3, Dibblee Estate on Meadow View Village Girl; 4, Bond on Mayfield Victoria; 5, Pacheco Cattle Co. on Pacheco Lass 111th.

Senior yearings—1, Glide on Kings Countess; 2, Dibblee Estate on Princess Royal; 3, Dibblee Estate on Lancaster Lady; 4, Dibblee Estate on Lavender Green.

Junior yearlihgs—1, Glide on Village Lassie; 2, Bond on Ormondale Maid; 3, Pacheco Cattle Co. on Pacheco Lass 141st; 4, Dibblee Estate on Ruby Avon.

Senior heifer calves—1, Pacheco Cattle Co. on White Pacheco; 2, Dibblee Estate on Lucy Lee 5th; 3, Pacheco Cattle Co. on Pacheco Blossom; 4, Glide on Village Rose; 5, Pacheco Cattle Co. on Pacheco Bloom; 6, Dibblee Estate on Orange Blossom A.

Junior heifer calves—1, Glide on Countess Fortuna; 2, Pacheco Cattle Co. on Pacheco Doris; 3, Bond on Cumberland Maid.

Senior champion cow, Little Sweetheart. Junior champion, King's Countess. Grand champion female, Little Sweetheart.

Graded herds—1, Dibblee Estate; 2, Glide; 3, Pacheco Cattle Co. Young herds—1, Glide; 2, Pacheco Cattle Co.

Calf herds—1, Glide; 2, Pacheco Cattle Co; 3, Dibblee Estate; 4, Pacheco Cattle Co. Produce of cow (two)—1, Dibblee Estate; 2, Glide; 3, Glide; 4, Pacheco Cattle Co.

Get of sire (four)—1, Glide; 2, Pacheco Cattle Co.; 3, Dibblee Estate; 4, Pacheco Cattle Co.

The Guernseys

The Guernsey show was crippled in more ways than one. The Dupee herd was unable to show, owing to the tie-up of railroads in Southern California, and the car containing the splendid exhibit of Elliott-Brant Rancho was derailed on the way up and practically every animal showed at least a scratch or two. The herds of Elliott-Brant Rancho, L. D. Smith and A. B. Humphrey made a strong showing for the breed even under handicaps. The awards:

Exhibitors: A. B. Humphrey, Escalon; Elliott-Brant Rancho, Owensmouth; H. K. Fish, Santa Barbara; L. D. Smith, Berkeley; James Marwick, Santa Barbara.

Aged bull—1, May King of Fern Ridge, Elliott-Brant Rancho; 2, Bullion of Edgemoor, Humphrey; 3, Mysie's Duke of Claremont, Smith; 4, Brookmead's White Face, Elliott-Brant Rancho.

Two year olds—1, Escalon Challenger, Humphrey; 2, May King of the Rancho, Fish; 3, Palo Boy, Smith; 4, Mysie's Prince of Claremont, Smith.

Senior yearling—1, Mysie's Laddie of Claremont, Smith; 2, Mysie's Linden Boy, Marwick.

Junior yearling—1, Nobleman of Maple Hill, Humphrey; 2, Lady Red's White Face of the Rancho, Elliott-Brant Rancho.

Senior bul calf—Admiral of the Rancho, Elliott-Brant Rancho; 2, Escalon Beauty Boy, Humphrey; 3, Prince Mysie of Claremont, Smith.

Junior bull calf—Escalon Truetype, Humphrey; 2, Syivester of the Rancho, Elliott-Brant Rancho; 3, Warrior of the Rancho, Elliott-Brant Rancho; 4, Glen's Fawn of Claremont, Smith.

Cows, four years old or over—1, Princess of Meadowbrook, Elliott-Brant Rancho; 2, Pet's Pansy of Pine Grove, Elliott-Brant Rancho; 3, Fair of Alfalfa Farms, Saylor; 4, Mysie's May of Claremont, Smith.

Three years and under four—1, Elsie of the Rancho, Elliott-Brant Rancho; 2, Corfu of Hillside, Elliott-Brant Rancho; 3, Mysie's Hope of Claremont, Smith; 4, Mysie's Star of Claremont, Smith.

Two years and under three—1, Dorothea of Green Lodge, Elliott-Brant Rancho; 2, Jeanie of Green Lodge, Elliott-Brant Rancho; 3, Calla Grove Itchen May, Humphrey; 4, Mysie's Moon of Claremont, Smith; 5, Lady's Bettie of Claremont, Smith.

Senior yearling—1, Redwing of the Rancho, Elliott-Brant Rancho; 2, Escalon Evangeline, Humphrey; 3, Mysie's May of Claremont 2nd, Smith; 4, Escalon Bopeep, Humphrey; 5, Mysie's White May of Claremont, Smith.

Junior yearlings—1, Butternut Queen of the Rancho, Elliott-Brant Rancho; 2, Little Queen of the Rancho, Elliott-Brant Rancho; 3, Calia Grove Merry Princess, Humphrey; 4, Mysie's Poppy of Claremont, Smith.

Senior heifer—1, Rosemary of the Rancho, Elliott-Brant Rancho; 2, Escalon Lassie, Humphrey; 3, Escalon Maggie, Humphrey; 4, Jilda of the Rancho, Elliott-Brant Fancho; 5, No Name, Smith.

Senior champion bull—May King of Fern Ridge.

Junior champion bull—Escalon Truetype.

Senior champion cow—Princess of Meadowbrook.

Junior champion — Redwing of the Rancho.

Grand champion bull—May King of Fern Ridge.

Grand champion female—Princess of Meadowbrook.

Aged herd—1, Elliott-Brant Rancho; 2, Humphrey; 3, Smith.

Young herd—1, Elliott-Brant Rancho; 2, Humprey; 3, Smith.

Calf herd—1, Humphrey; 2, Elliott-Brant Rancho; 3, Smith.

Get of sire—1, Humphrey; 2, Elliott-Brant Rancho; 3, Smith.

Produce of dam—1, Elliott-Brant Rancho; 2, Humphrey; 3, Elliott-Brant Rancho.

Dairy herd—1, Elliott-Brant Rancho; 2, Smith.

CATTLEMEN'S BANK

The California Cattleman, organ of The State Cattlemen's Associataion, suggests a bank which shall be financed and controlled by the cattlemen of California. It says:

"The suggestion came originally from H. A. Krohn of Coarsegold, Madera County, and at the time he made it there was available from his community upwards of $100,000 for investment in such an institution. There is no gainsaying the fact that a bank, whose policies were to be directed by the cattlemen for the benefit of the cattlemen, would become a tower of needed strength. No better paper than cattleman's paper exists, and no more honorable cattlemen than the genus Californicus may be found."

PRINCE RIVERSIDE WALKER

OUR SENIOR HERD SIRE

His Sire: PRINCE GELSCHE WALKER, whose daughters have broken more state and world's records than the daughters of any other single sire in California, and whose get have outsold the get of any other sire in the west.
His Dam: AAGGIE ACME OF RIVERSIDE, who recently completed her second yearly record with 1053.14 pounds butter from 20,354.8 pounds milk beginning her record at past 11 years of age. She is dam of the world's official yearly record cow Aaggie Acme of Riverside 2nd, 1331.78 pounds butter in one year, who in turn is dam of the sensational junior two year old heifer Miss Aaggie Acme Burke who promises to make right around 1000 pounds butter in one year at first oalving.
A son of PRINCE RIVERSIDE WALKER out of one of our good cows is first class insurance against unproductive cows in your future herd. Let us describe and quote one to you.

OUR ENTIRE HERD IS TUBERCULIN TESTED.

Club Work Keeps Boys on the Farm

By Robert W. Hodgson, Farm Advisor for Los Angeles County

ONE of the pressing problems confronting American agriculture at the present time is that of keeping our country boys on the farm. History teaches us that the rural population ultimately furnishes the ruling class for our cities. The reason is that the average family in the American city is not large enough to take care of repopulation. Our cities have grown and will continue to grow at the expense of the rural sections. If America is to remain for Americans it is of the utmost importance that boys of the Angio-Saxon stock remain on the farms of this country.

One of the main reasons why the American boy has left the country for the city is that he early receives the impression there is little or no money to be made in farming. While he toils and sweats at pitching hay or plowing, for which he receives nothing, his city cousin is holding down a job at the corner drug store at a dollar a day or better. Dad is the only man on the farm who ever sees any money, Johnny only occasionally being given a 50-cent piece or a dollar when the circus comes to town. It is no wonder that early in life the average country boy decides that when he grows up he will move to town to live. His reason for his feelings may well be summed up in the following lines:

"Why did you leave the farm, my lad,
Why did you bolt and quit your dad?
Why did you beat it off to town,
And turn your poor old father down?"
Thinkers of platform, pulpit, press,
Are wallowing in deep distress;
They seek to know the hidden cause
Why farmer boys desert their pa's,
Some say they long to get a taste
Of faster life and social waste;
And some will say the silly chumps
Mistake the suit cards for their trumps,
In wagering fresh and germless air
Against the smoky thoroughfare,
We're all agreed the farm's the place,
So free your mind and state your case.
"Well, stranger, since you've been so frank,
I'll roll aside the hazy bank,
The misty cloud of theories,
And tell you where the trouble lies.
I left my dad, his farm, his plow,
Because my calf became his cow;
I left my dad—'twas wrong, of course—
Because my colt became his horse.
I left my dad to sow and reap,
Because my lamb became his sheep.
I dropped my hoe and stuck my fork,
Because my pig became his pork,
The garden truck that I made grow,
'Twas his to sell, but mine to hoe.
It's not the smoke in the atmosphere,
Nor the taste for life that brought me here;
Please tell the platform, pulpit, press,
No fear of toil or love of dress,
Is driving off the farmer lads,
But just the methods of their dads."

As an organized effort to face this problem of the country boy leaving for the city just as soon as he can break away from dad, Boys' Club work was instituted some five years ago under the Smith-Lever act. The work has proven immensely popular. Boys' clubs of all kinds from potatoes to pigs have been organized in the grammar schools and high schools all over the country, some under the supervision of district club leaders who are high school teachers employed part time for this work, and others under county club leaders working out from the office of the county farm adviser.

Los Angeles County is one of the few counties in California fortunate in having a county club leader in the person of Assistant Farm Advisor W. G. Waterhouse. Mr. Waterhouse has been in the field only a little over six months but in that time has organized and directed the efforts of nearly 20 boys' clubs in this county.

Club work is really nothing more than commercial farming on a small scale under the supervision of a trained man. The main object of the club project is to make money, and to be successful in club work a boy must make a good profit. The boys are required to keep accurate records of all expenditures for materials and to keep track of the time they put in, charging current rates for it. To be successful a club project must show a profit on the right side of the ledger after all proper charges against the business have been made. At the end of the contest each boy is asked to write a short story of his experiences, a number of which are reproduced here. In Los Angeles County the pig club has proven very popular and the boys have raised some excellent individuals. Once shown that there is money to be made in farming and that the country is a desirable place to live, there can be little doubt but that more of our country boys will plan on following the profession of farming.

* * *

I was discouraged with my pigs at first because they did not eat as much as I thought they should. They seemed content and well but they would eat a little and then curl up in the straw and go to sleep. I would sometimes have to waken them to get them to eat. But perhaps it is as natural for little pigs to sleep as it is for pups. They got over this drowsiness before long and it soon became a problem to keep them in feed. I fed them twice a day and at noon gave them a bath by throwing several buckets of water on them. They seemed to enjoy this a great deal and would run and lie down in the trough whenever they saw me coming with a bucket. In the mornings and evenings they would stand with their front feet up on the tops of the fence and squeal for their feed. In selecting a pig to raise I would advise selecting a prettily marked or well shaped pig. Mine had the Hampshire markings and they sure were pretty pigs. They seemed quite content with their pen and were exceptionally clean and practically odorless.

In feeding them I tried to make their meals as tempting and agreeable as possible. I know I get tired of one kind of grub so why shouldn't a pig get tired of beans, beans, beans. So with the idea of getting them to enjoy their feed and consequently eat more I varied their rations as much as possible and gave them plenty of green feed. On the whole, I am very well satisfied with my undertaking. I and my pigs have grown to be great friends. They love to have me rub and scratch them and I enjoy playing with them and sometimes teasing them a bit. I also enjoy showing them to my friends. And they bid fair to bring me a good profit for time and money invested and a great deal of satisfaction and pleasure in caring for them.—George M. Schwn, Jr., age 19, Puente.

* * *

I am a member of the pig contest. I joined it because I thought I might make some money. One day when I came home from school I found a little black pig in the pen. My mother got it for me while I was at school. I named him Rastus because he is black. I got a Poland-China because I like that kind of a pig. I think green feed is good for a pig because it carries the substances that make bone and muscle. My pig did not drink very much water but he liked to lie in water. When I got my pig I weighed him on some 50-pound scales. I put him in a barley sack to weigh him. I feed him three times a day. I feed him bran and slop in the morning and night, water and green feed at noon. I spend my time feeding and cleaning out his pen. I made a pet out of him. Mr. Waterhouse came and told me how to take care of my pig. I have never had the opportunity to attend the pig show or a prize contest. Well-bred pigs are much better than scrubs because the scrubs don't grow so fast. I am planning on winning first prize next year. I think that if you keep the pig's pen clean he will try to help to keep it clean also. And you don't want to feed your pig too much or not enough. A boy that takes care of his pig and keeps up-to-date in his work is the kind of a boy that makes a good pig club member.—Delbert Johnson, age 13, Whittier.

* * *

Mr. Waterhouse gave a talk on pig clubs at school so I joined and got a pig. We looked at several but thought this was best. As I could not let my pig run on pasture I cut green alfalfa and pig weed for him. My pig did not drink much water. My scales would not weigh over 50 pounds so I used a strap around the pig and the scales till it go so big the scales would not weigh it any longer. I fed my pig three times a day. I fed him corn,

shorts, alfalfa, barley and milk and what waste I could find. I also carried water for my pig to lie in during the hottest part of the day. I spent my time feeding my pig, cleaning the pen, carrying water and putting a mixture on to kill lice. Also my pig was a fairly good pet. I selected this breed because I liked it best and had read about it.

Mr. Waterhouse told me how to care for my pig and told me how to keep my records. I did not go to a fair, but Mr. Waterhouse took up to a nearby ranch and we saw some prize winning show pigs. They were Duroc-Jerseys. We also saw the method of taking care of pigs. Well bred pigs are better than scrubs for results. Scrubs are often sick and do not grow as fast. If I can I should like to join a contest next year. But I would rather have the contest longer. I have learned that pigs need all they want to eat and drink, lots of exercise, a clean pan, good care and they have to be watched for lice. In hot weather they should have a place to wallow but water should not be poured on them. They also need a variety of feed and a warm place for cool nights, and a pig if posible should have a pasture to run on. If this cau not be had, then green stuff should be got for them. A pig club member ought to know something about a pig to begin with and he should be willing to take care of them and take care of his records and read the papers sent out by the government to him.—Waldo Smith, Pomona, age 14.

* * *

I am a pig club member because Mr. Waterhouse came around to school and started a club. I bought my pigs with money from raising potatoes. I named my pigs Betty and Jack because they were supposed to be named. I selected the Duroc and Hampshire breed because I thought they were good. Pastures and green feed are good because green feed furnished some protein, which is necessary. My pigs drink considerable water. When my pigs were small I weighed them in a sack but later had to use a crate. I fed my pigs in a trough, a self feeder would be better. I fed my pigs three times a day. I fed my pigs shorts, wheat middlings, tankage, skim milk and rolled barley. I spent my time with my pigs feeding them and cleaning the pens. My pigs didn't become pets. Mr. Waterhouse visited me and told me how to care for my pigs. Pure bred pigs are better than scrubs because they have been bred and selected to consume more feed and put on the gain in the part most valuable to the butcher. They will also gain faster. Pure bred hogs are much more valuable than grade hogs. I am planning to join the pig club next term because it is a very good thing. I have learned lots about pigs, the club having visited some of the large hog ranches we learned their methods of hog raising. I have also learned considerable from the circulars and bulletins. A boy that takes interest in his pigs makes the best pig club member.—Chester Irish, Norwalk, age 15.

* * *

One day when I was at school I heard about the pig club. So I thought I would join because it would be a good way of making some money and also learn how to raise a pig. I found a place where I could get a good pig very reasonable so I got it. It was a Hampshire and I like that kind very much. It was a pure bred hog so I got it registered because if I keep it for a brood sow I can sell the little pigs better. Being in a fattening contest I though I would get a large formed hog as it would put on fat better than a small one. When you are making the size of the pig one good thing to feed is green alfalfa. When I got my pig I could not come close to the pen without it would run to the other side. But now when I come to the pen it will come right up to where I am standing. When you are buying a pig it is better to get a pure bred than a scrub because you can sell them better. I have learned lots about raising pigs since I entered the contest and hope they have another soon.—Harold Comber, Burbank, age 14.

RATION FOR DAIRY CALVES

On farms selling whole milk it may be found advantageous to raise the calves for the dairy herd on calf meal instead of whole milk. The meal or gruel is added to the ration in increasing amounts beginning when the calf is two weeks old. A feeding plan which will work out fairly well with calves of average size is presented in Station Circular 88 of the University of Missouri college of agriculture. The feeds used are whole milk, calf meal, grain and hay. Calves receive whole milk until they are two weeks old. For the next week the quantity of milk is reduced and a pound of gruel added. In the foruth week the calves receive nine pounds of milk, three pounds of gruel, a little grain and some coarse hay or alfalfa. From thirty days to six weeks the ration consists of six pounds each of milk and gruel together with a little grain and hay. The milk is then discontinued and the calves receive 12 pounds of gruel, a half pound of grain and a small amount of alfalfa hay. At two months of age the calves are getting 14 pounds of gruel, one pound of grain and have free access to alfalfa hay. The gruel is discontinued after the fourth month, and the grain is gradually increased until by six months the calves are getting four and one-half pounds of grain and all the alfalfa hay they will eat.

Gruel feeding may be continued after the fourth month if desirable or it may be discontinued at three months of age and the calf be put on a hay and grain ration.

Remember that calves will probably be less fat and smooth when fed on calf meals than when fed on milk. However, they should be of practically the same size and in a good thrifty condition. Milk is preferable as a feed and at equal costs should be given in preference to substitutes. The use of calf meal is valuable only when the selling price of milk makes the use of milk prohibitive.

All of the precautions to be followed in feeding whole or skim-milk must be observed when using calf meals.

Do not overfeed.

Give feed in a clean, wholesome condition.

Have all utensils scrupulously clean.

Feed regularly and in small quantities.

Always feed at a temperature of 95 to 100 degrees Fahrenheit. Use a thermometer—do not use your finger.

Give the calf water to drink.

Be regular in everything.

Give the calves exercise in the open air during good weather, but do not expose them during cold, rainy weather.

Provide clean, well-lighted pens with plenty of bedding.

Whenever possible give each calf a separate pen and limit the feed of each animal. If a separate pen is not possible, stanchions must be used. Especially is this true when raising calves without skimmilk.

GET THE SILO READY BEFORE FILLING

The silo should be inspected thoroughly before filling is started for openings in the walls where air might enter and spoil the stored crop and for rough places which might prevent the proper settling of the corn. The hoops on stave silos should be tightened sufficiently to close all cracks but they should not be tight enough to buckle the staves. The staves will absorb some moisture from the silage; consequently, the hoops should be released somewhat a few days after the silo has been filled to prevent the swelling staves from buckling and from breaking the hoops. The walls of masonry silos should be inspected for cracks, sand pockets and rough places. Some owners give the inside surface a thin coating of rich cement with a whitewash brush. This is not necessary unless the surface of the wall has become roughened. Metal silos frequently need fresh applications of specially prepared paints to prevent corroding.

A careful inspection of the cutter machinery and corn binder previous to starting work is also recommended by the University of Missouri college of agriculture, in order to save unnecessary stops and repair bills. Have the machinery all in good running order and provide enough teams and wagons to keep the cutter running steadily. Ten or twelve men idle at one time rapidly increases the cost of silo filling.

Once Again!!

CATTLE

AUCTION SALE
110 EXTRA HIGH GRADE HOLSTEINS
A complete dispersal of the Roeber Company herd on their farm, 4 miles north, 1½ miles west of Maxwell, Colusa County, California. Irrigation of nearby rice fields has raised the water level of the alfalfa fields, curtailing the crop to such an extent that this sale is necessary. One of the finest herds in California. High class Wisconsin cows and their daughters by one bull whose sire is out of a cow that made over 18,000 lbs. milk and over 776 lbs. butter in one year, and by one whose sire is a grandson of Tilly Alcartra out of a dam that made over 17,900 lbs. milk and over 702 lbs. butter in one year. One of the very best herd of grade Holsteins ever sold in northern California. Date of sale, Tuesday, September 23, beginning promptly at 10 a. m. Auctioneer, Col. Ben A. Rhoades, Los Angeles. Sales manager, C. L. Hughes, Sacramento.

AUCTION SALE

To make way for an enlarged herd of registered Holsteins, Brookhollow Ranch, Hollister, Calif., will disperse its entire herd of high grade Holsteins consisting of 135 cows and heifers. Private milk record of every cow will be announced at sale. About seventy-five per cent of heifers are granddaughters of Juliana King of Riverside. This is a very choice herd of grade Holsteins. Auctioneer: Col. Ben A. Rhoades, Los Angeles; Sales Manager, C. L. Hughes, Sacramento.

BUTTE CITY RANCH
Shorthorn Cattle, Shropshire Sheep, Berkshire Hogs, Shetland Ponies, Bronze Turkeys, White Plymouth Rocks. Stock for sale at all times. Third sale at the Ranch—all breeds—April 17, 1920. W. P. Dwyer and W. S. Guilford, Box C, Butte City, Glenn County, California.

Shorthorns bred for Range Purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome, information cheerfully given. T. T. Miller, Hollister, California.

FERTILIZER

For Sale—Chicken manure in carloads. Cheapest and best fertilizer. MacDonald Sons Phone 101 Watsonville

The New 16 Valve

Twin City Tractor

Pays Big Dividends

For the first time in the history of the tractor industry, the 4 cylinder, 16 valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16 valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

Life of Blackberries

How long will blackberries bear successfully? — Subscriber, Owensmouth.

With good care a blackberry should produce well for about eight years—J. W. M.

Mealybug on Grapes

How can a person make grapes affected with mealybug marketable? Also, what can we do to check the pest for next season?—Subscriber, Stockton.

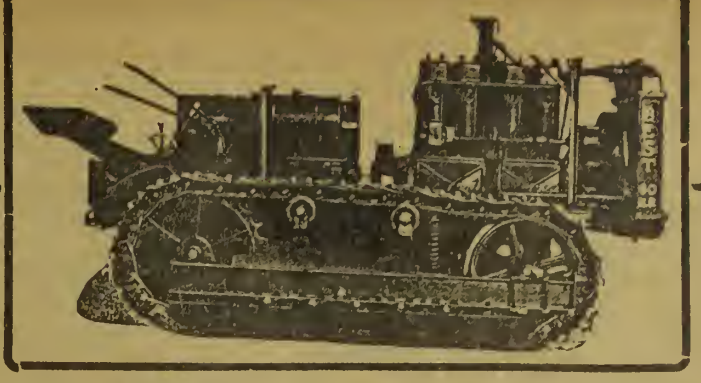
There seems to be no way to save this crop now affected with the mealybug, that is, to save it as a first class article. In drying raisins the pest seeks the lower side of the grapes where it still is in the shade and continues to grow and multiply during the ten days until the time comes to turn the grapes over. It exudes its "honeydew" which affords a medium for the growth of fungus and even causes a portion of the decay of large fine bunches. The only way to save the table grape is to clip off the affected portions, and in badly affected vines this means that practically every bunch and sometimes the entire bunch is spoiled. To prevent an attack another year, fumigate. As to methods, these will be given later, together with methods of spraying by the department of agriculture for California. Prof. Nougaret, who has just become connected with the department, is taking up this particular question, as are others both with the department and with the university. Treatment should be after the dormant period. When the leaves have dropped tents may be thrown over the vines and a heavy charge of hydrocyanic acid will destroy the pest. Spraying is not effective with this particular pest because of the habit of the insect seeking hidden crevices under bark often out of the reach of sprays. As may be noted in "Honeydew Grapes" on page 300 of last week's issue, Director Hecke, of the state department, is calling a conference at the University Farm School, Davis, for the purpose of formulating quarantine regulations. He, with Prof. Nougaret, is giving attention to this pest.

Fence Law Muddle

The state laws touching upon fencing are explained by Mr. Stanton in the legal queries in the issue of the California Cultivator of July 19, page 63. However the fence situation is one involving many legal technicalities. There is a state law; besides that nearly every county in the state has its own fence law; and again many of the municipalities. It would be impossible to give a review of all of these or even to touch upon the great diversity of them. There should be a general clearing of the situation by consistent legislative action which would give protection to both fruit producer and live stock owner.

Wild Turkeys for Breeding

Replying to a subscriber who asked for name of some one who could get him wild turkeys for breeding, M. E. Bemis of Phoenix, Arizona, answers: "This will be a rather difficult proposition and one which would have to be handled through our game warden. I am referring your letter to the state game warden, Joe V. Prochaska, and feel sure if there is any chance to get hold of some wild turkeys for breeding purposes that he will put you in touch with the right parties. I think there are more wild turkeys in the White Mountain region than any other section and very likely Mr. Prochaska can refer you to some one in that section who will be able to trap them for you."



THE BEST EXHIBIT

AT THE TRACTOR SHOW

TWO NEW TRACK LAYER MODELS

TRACKLAYER

C. L. Best "60" Track Layer

Best "60" Tracklayer like the "25," the ultimate in tractor construction. Thirty-seven anti-friction Hyatt and Timken bearings. Weighs 17,500 pounds. Does the work of 35 horses. Will stay on the job as long as it is given reasonable care and attention. This tractor is scientifically lubricated; easy of access. Built like a draft horse throughout. Requires minimum attention.

C. L. Best "25" Track Layer

Best "25" Tracklayer. An anti-friction tractor driven by a heavy duty slow speed Best motor. Designed to meet the conditions under which this tractor must work. Built to last a lifetime with proper care and attention. Pulls its width in plows—runs on the land, not in the furrow.

The Famous Hardie Junior is a Real Power Sprayer

It has sufficient capacity for two lines of hose. It has plenty of power for high pressure effective spraying. It is little in first cost, weight, and upkeep. It is big in real value, engine power, pump capacity and ability to do successful spraying. We believe this is the greatest small power sprayer ever manufactured, and placed on the market with phenomenal success in every fruit section in United States and vouched by thousands who own the Famous Hardie Junior. Equipped with 1½ horsepower engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of four gallons per minute with a steady working pressure of 200 pounds, and two 25-foot of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

All for $315. ***Delivered anywhere in this state***

If truck is not needed, deduct $55.00.

These prices are subject to change without notice. The wise buyer will place his order now.

This low price is made possible by big production.

If you are interested in other types and sizes of the HARDIE POWER SPRAYER, write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufacturer.

The HARDIE ORCHARD GUN is $12.00, none better. Every one is guaranteed to give satisfaction to the user, or his money refunded.

The Hardie Spray Hose is the safest hose to buy.

The Latest on Grape Syrup

By W. V. Cruess and Jean W. Christie

THE manufacture of grape syrup from wine grapes may yet prove to be the most practicable method of utilizing the crops from our wine grape vineyards when national prohibition becomos permanent. Compared with dried wine grapes, the only other product seriously considered by wine grape growers, grape syrup, has several advantages. It can be used for wine making much more readily than can raisins because no soaking, crushing and pressing are necessary. It is even superior to raisins for wine because it is possible to make a grape syrup with a full fresh grape flavor and intense red color: qualities difficult to attain in dried wine grapes. The syrup is excellent for high class sherbets or water ices and, finally, is well suited to soda fountain use in ice cream sodas, on ice cream specials and in fountain beverages.

Several methods of preparing grape syrups have been described in Bulletin 303 of the University of California experiment station, but the methods therein discussed have been very greatly improved upon as the result of experiments completed since its publication. A number of different types can be made, but only three will be discussed. Theso will be takcn up in order of their importance, the most desirable being considered first.

Red Syrup of High Flavoring

The flavor of grapes consists of a number of volatilo compounds which are lost from the juice or syrup during the ordinary process of evaporation. This loss occurs at any temperature used, even if tho juice is made into syrup by drying in the breeze, because these flavors are more volatile than the water which must be removed to rcduce a juice to syrup. For this reason all syrups made by the usual methods of evaporation aro deficient in flavor.

However, it has long been known that maple sap and other sugary liquids may be concentrated by allowing the liquid to freeze slowly. Pure water first separates in the form of ice crystals. When these crystals are removed the residual liquid is much enriched in sugar and flavor. Apparently, this process does not injure the flavor, which tends to concentrate in the unfrozen syrup rather than in the ice.

This process has been developed in Italy by Eudo Monti of Turin, who has invented several machines that carry on the process in a continuous manner. Juice flows into one part of the apparatus and syrup from another. One of his machines is described in U. S. Patent, 955,659—1910. Royalties must be paid if his particular machine is used. H. C. Gore of the United States department of agriculture in 1914 experimented with this process and obtainod a patent which has been donated to the public for use without royalty or charge of any kind. His process consists essentially of the following steps:

The juice is frozen to a solid mass at 10-20 degrees Fahrenheit. It is then broken in an ice crushing machine. The crushed ice is placed in an ordinary sugar centrifuge and the syrup separated from the ice by centrifugal force. The syrup is thrown through the small holes of the centrifuge basket and the ice remains in the centrifuge. The syrup so obtained is again frozen at 0-10 degrees Fahrenheit to a mushy mass of ice crystals and syrup. By centrifuging this mixture a syrup of 55 to 60 degrees Balling is obtained. A small amount (about 1 per cent) of sugar is lost in the ice. Gore's work was done upon apple juice.

The writers repeated Gore's experiments but used Muscat grape juice instead of apple juice. A syrup of 55 degrees Balling was as rich a syrup as it was found feasible to produce with the equipment used. The syrup was therefore not sweet enough for general use and would ferment quickly unless sterilized. Even a 60 degree Balling syrup is too "thin" and will not keep long. A 60 degree Balling syrup is the sweetest syrup recorded as having been produced by this process.

Therefore, it was found necessary to blend with this syrup obtained by freezing, a syrup of 70-75 degrees Balling made in an ordinary vacuum pan. The blend of 65 degrees Balling was very rich in flavor and far superior to any syrup that had previously come to the writers' attention. A syrup very much sweeter than 65 degrees Balling has been found to crytallize badly; therefore the syrup should not exceed 70 degrees Balling.

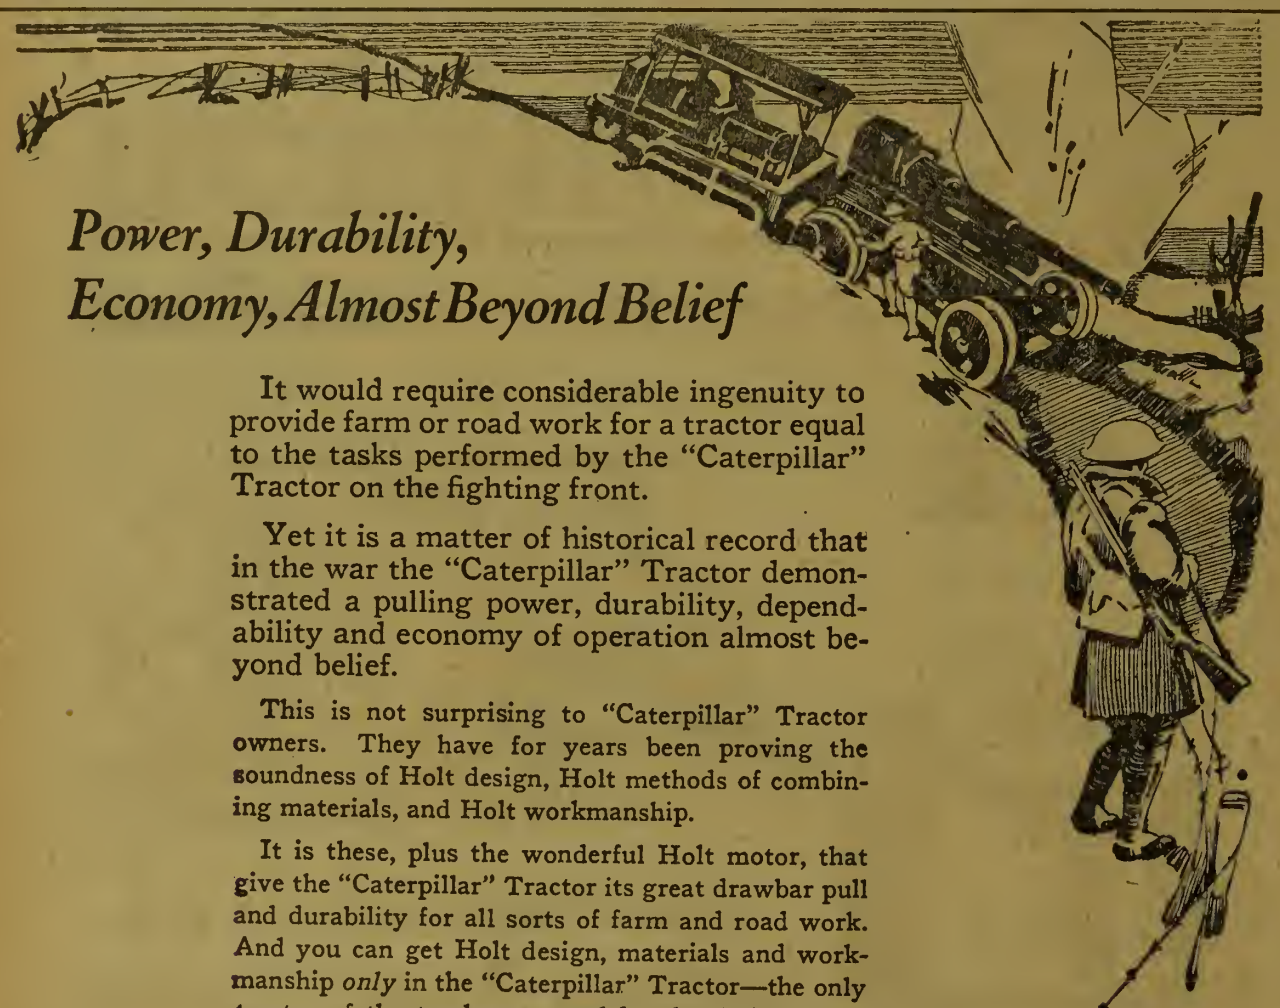
It was noted that the ice left in the centrifuge was sour in taste. When melted it was found to contain 75/100 of one per cent of cream of tartar and a similar amount of sugar.

On concentration of a sample of this liquid to a small volume most of the cream of tartar was recovered in a quite high state of purity. This suggests the possibility of obtaining cream of tartar as a valuable by-product.

In addition to flavor and a concentration of 65 degrees Balling, it is desirable that the syrup possess a red color. The color of most red grapes is located entirely in the skins and is insoluble in the cold juice. The juice must be heated in order that the color may be extracted. The most suitable method has been found, to consist of crushing and pressing the grapes: heating the juice to 130 degrees Fahrenheit, returning the hot juice to the skins and allowing juice and skins to stand eight to ten hours and pressing. Petite Sirah, Zinfandel Carignane and other red wine grapes give a juice of deep red color by this method. Alicante Bouschet grapes will, of course, produce a red juice without heating, but the Alicante's color has been found to be less permanent than that of other grapes. Only thoroughly ripe grapes should be used. The red juice obtained in this way should be heated to 160 degrees Fahrenheit and allowed to settle over night to cause coagulation of the proteins which would otherwise cause the syrup to become cloudy. The settled juice should then be filtered. It may then be concentrated in a vacuum pan to 70-75 degrees Balling. During concentration, use a vacuum of 25 inches or better, and do not leave juice in the pan longer than one and one-half hours. This syrup would then be blended in about equal proportions with the syrup obtained by freezing. The vacuum process syrup furnishes color and sugar and the syrup made by freezing furnishes flavor. The syrup tends to caramelize in the vacuum pan if heated too long: under no consideration should more than one and one-half hours be used for each charge. The shorter the period of heating the better the color and quality.

In heating grape juice, only tin lined, silver lined, glass lined or aluminum apparatus can be used. Copper and iron dissolve rapidly in the hot juice. A large Eastern manufacturing company has made cooperative tests with the authors and obtained excellent results in the concentration of grape juice in a glass lined vacuum pan. This material is commonly used in boiling down tomato products, fruit jams and other products in canneries. It consists of cast iron heavily enameled with a very resistant glass like coating, which is actually fused with tho iron. This ware is made in the form of kettles, tanks, vacuum pans, pipes, etc., and would be well adapted for uso in grape syrup manufacture.

The juice to be concentrated by freezing would not be heated upon the skins, because the long period at a high temperaturo upon the skins results in a great loss of flavor. The grapes would be crushed and pressed. The juice so obtained would be heated in a continuous wine pasteurizer to 160 degroes Fahrenheit, and cooled at once as is done in pasteurizing wine. The juice would then be allowed to settle to permit coagulated protein to separate. It would next be filtered. Tho filtered juice would be frozen slowly at 10-20 degrees Fahrenheit to preferably a heavy mixture of large



Power, Durability, Economy, Almost Beyond Belief

It would require considerable ingenuity to provide farm or road work for a tractor equal to the tasks performed by the "Caterpillar" Tractor on the fighting front.

Yet it is a matter of historical record that in the war the "Caterpillar" Tractor demonstrated a pulling power, durability, dependability and economy of operation almost beyond belief.

This is not surprising to "Caterpillar" Tractor owners. They have for years been proving the soundness of Holt design, Holt methods of combining materials, and Holt workmanship.

It is these, plus the wonderful Holt motor, that give the "Caterpillar" Tractor its great drawbar pull and durability for all sorts of farm and road work. And you can get Holt design, materials and workmanship *only* in the "Caterpillar" Tractor—the only tractor of the track-type used by the Allies in the great war—chosen and proved by severe and prolonged tests.

Get your "Caterpillar" Tractor now. Send for Catalog 403.

SAN FRANCISCO California

ice crystals and syrup. The mixture would be whirled in an ordinary sugar house centrifuge and the syrup drawn off. The ice crystals in the centrifuge basket would be lightly washed with a spray of water to remove adhering syrup. The ice would be transferred to tanks; allowed to melt and the liquid would be boiled down to recover the cream of tartar. The light syrup from the centrifuge (about 40 degrees Balling) would again be frozen at 0-10 degrees Fahrenheit and again centrifuged to give a syrup of 55-60 degrees Balling. The ice would be treated as in the first centrifuging. The syrup of 55-60 degrees Balling would then be used to blend with the red syrup of 70-75 degrees Balling obtained by vacuum concentration.

The blend, which should be 65-67 degrees Balling, is then allowed to settle for three to four weeks in clean vats or tanks to permit separaration of excess cream of tartar. The settled syrup is then drawn off, strained or filtered, and is put in bottles or cans. The filled containers should then be sealed and placed in a pasteurizing tank which is next filled with cold water. The water is heated by steam coils slowly to 160 degrees Fahrenheit and kept at this temperature 30-35 minutes to destroy yeasts and molds which would in time cause fermentation or molding. After removal from the pasteurizer and cooling, the syrup is ready for marketing.

In order that a comprehensive view of the whole process may be had, the reader is referred to the following outline:

Red Syrup of Fresh Flavor

I.—Color Syrup by Vacuum Process: 1—Crush and press ripe red wine grapes. 2—Heat juice to 130 degrees Fahrenheit in glass lined, tin lined or aluminum pasteurizer or kettle. 3—Mix hot juice and skins in convenient vat and allow to stand 8-10 hours. 4—Press. 5—Heat to 160 degrees Fahrenheit and allow to cool and settle over night (12-15 hours). 6—Filter. 7—Transfer to vacuum pan and concentrate under vacuum of at least 25 inches to 170-75 degrees Balling. Do not leave liquid in pan longer than one and one-half hours from time juice enters pan. Blend with syrup from II.

II.—Flavor Syrup by Freezing Process. 1—Crush and press grapes of good flavor. Muscat grapes preferred. 2—Heat juice to 160 degrees Fahrenheit in wine pasteurizer and cool at once. 3—Allow to settle over night. 4—Filter. 5—Freeze at 10-20 degrees Fahrenheit until thick mass of syrup and ice crystals form. 6—Centrifuge in sugar house centrifuge. Rinse ice with a little water. Melt ice and recover cream of tartar by boiling down and cooling. 7—Freeze syrup at 0-10 degrees Fahrenheit to mass of crystals and syrup. 8—Centrifuge as in "6." Blend syrup so obtained with syrup from I. (by vacuum). Recover cream of tartar from ice as in "6."

III.—Blend of I. and II. 1—Mix thoroughly and allow to settle in clean tanks 3-4 weeks. 2—Draw off and strain. Recover cream of tartar from settling vats. 3—Bottle or can the syrup and seal containers. 4—Place in water and heat to 160 degrees Fahrenheit for 30 minutes. 5—Remove and allow to cool.

As previously stated, this syrup is deep red in color, of fresh grape flavor and of a pleasant acid taste. It is an excellent table syrup, soda fountain syrup and is much superior to dried wine grapes for wine making purposes. It has greater possibilities than any of the syrups described later.

The pomace (i. e., skins, seeds and stems) from the presses contains a large amount of sugar and cream of tartar. These values may be easily and simply recovered by leaching with water, followed by concentration to a syrup by one or both of the methods previously described. The leached pomace may be pressed and dried; the seeds separated from the dried skins by screening; and oil recovered from the seeds by crushing and pressing in seed oil presses. A ton of grapes will yield about 60 pounds of seeds and a ton of seeds about 200 pounds (about 30 gallons) of oil suitable for table use when properly refined. The pomace by-products should not be neglected.

Red Syrup of "Jelly" Flavor

A syrup of deep red color and very pleasing "blackberry jelly" like flavor has been made repeatedly from five gallon lots of juice of red wine grapes in our experimental vacuum pan at Berkeley. No freezing process is employed. We have found the secret of success with the vacuum pan to lie in keeping each "batch" of syrup in the pan as short a time as possible. Prolonged heating destroys the grape color and drives off the flavor.

Very briefly the process is as follows: a. Crush and press ripe red wine grapes and if posible add a small quantity, 10 to 25 per cent, of ripe Muscat grapes. b. Heat to 130 degrees Fahrenheit and return to skins for 8-10 hours to extract color. c. Press. d. Heat to 160 degrees Fahrenheit and allow to cool and settle overnight. e. Filter. f. Concentrate in tin lined, glass lined or aluminum vacuum pan at 25 inches vacuum or better to 65-67 degrees Balling. Do not allow syrup or juice to remain in pan longer than one and one-half hours for each run. g. Allow to settle 3-4 weeks. h. Draw off syrup and bottle or can. Cream of tartar may be recovered from the tanks after settling of syrup. i. Pasteurize in water at 160 degrees Fahrenheit for 30-35 minutes.

Or the syrup may be heated in a suitable continuous pasteurizer to 170-175 degrees Fahrenheit and filled into cans hot and sealed at once. If to be used for wine making, it may be concentrated to 72 degrees Balling and filled into barrels, cans or bottles without pasteurizing.

This syrup is a very good table syrup and can be used to replace either jelly or syrup. It has been fermented in a small way after dilution with water and found to give excellent results. It can be made more cheaply than syrup No. 1, made by combined freezing and vacuum and its manufacture requires less outlay for equipment. It is undoubtedly the most practical syrup, the manufacture of which would be undertaken by the average wine maker.

White Table Syrup of Fresh Flavor and Low Acid

This syrup has been made in the laboratory, using five gallon lots of Muscat juice concentrated by the freezing process to blend with a white syrup of low acid made by the vacuum process. The finished blend is light amber in color; of a slightly more acid taste than the usual table syrup and with a full rich Muscat flavor.

To produce the neutral syrup, the following steps were carried out. Ordinary white wine grapes (Burger chiefly) were crushed and presesd. The juice was clarified by heating and filtering as previously described for red juice. The acidity was determined by titration by the method used in all laboratories in the analysis of fruit juices. Enough precipitated chalk (calcium carbonate) was added to reduce the acidity of the juice to between .15 and .20 per cent acid calculated as tartaric acid. The juice was heated to about 165 degrees Fahrenheit to cause reaction between the chalk and fruit acid to take place. The juice was cooled over night and filtered to remove the calcium tartrate, which settled to the bottom of the containers. The filtered juice was then concentrated in vacuo to a moderately heavy syrup and blended with the syrup obtained by freezing. It was found that 25 per cent of the syrup made by freezing (that is, 1 to 3) was sufficient to give the desired flavor. Some cream of tartar and calcium tartrate separate from the blended syrups on standing. The blended syrup should, therefore, be allowed to stand three or four weeks before canning and pasteurizing in the way described for other syrups. It should be filtered before canning.

Cream of tartar and calcium tartrate are recovered as valuable by-products.

It was found that syrup neutralized with chalk as described above contains .34 per cent lime, which is considerably more than that contained in syrup not so treated. The precipitation of calcium tartrate enriches the syrup in soluble potash salts, chiefly potassium tartrate, but not to such an extent that the flavor of the syrup is affected.

The syrup produced by this method is superior in flavor to the syrups dis-

Are Equipment on All Fairbanks-Morse "Z" Engines

FAIRBANKS-MORSE famous "Z" kerosene engines for the farm are now equipped with Champion Dependable Spark Plugs.

These sturdy, economical engines are making work easier for more than 250,000 farmers. Ranging in size from 1½ horsepower to 15 horsepower, they are adapted to countless power jobs. They run cream separators, milking machines and washers. They operate electric light plants and water systems. There is hardly a power need that is not met fully and capably by one of the reliable Fairbanks-Morse "Z" kerosene engines.

Fairbanks Morse "Z" engines hold an enviable reputation for performance, economy and quality. The choice of Champion Dependable Spark Plugs as standard equipment for this line of engines, means still another important step in insuring their satisfactory operation under all conditions.

Champion Dependable Spark Plugs have proved their worth in all weather and in all climates on every type of internal combustion engine. Their adoption by Fairbanks-Morse is but one more proof of the high esteem in which they are held.

'19	66½	66	65½	66	68
'18	63	64	63½	..	..

Rcts. wk. ending September 8, 315,778 dozen.

POULTRY

Hens, W. Leghorns, 28@32; colored, 35@36; roosters, young 35@36; old, 19@21; broilers, 30@34; fryers, 33@34; squabs, 2.50@4.00 dozen; ducks, 25@27; geese, 23@25; broiler turkeys, 40@47.

Belgian hares, live, 15@16; Jackrabbits, 1.50@3.00 doz.

LIVE STOCK

Western Meat Company prices are:

Cattle: Grass steers, No. 1, weighing 950 to 1000 lbs., 10@10½; do, 1100 to 1300, 9½@10; do, second quality, 8@8½; do, thin, 6@7.

Cows and heifers: No. 1, 8@8½; second quality, 6¾@7½; common to thin, 4@5½.

Calves: Light weight, 12½@13½; medium, 12@12½; heavy, 10½@11½.

Lambs: Yearlings, 10; milk, 12@12½.

Sheep: Wethers, 8½@9; ewes, 6½@7.

Hogs—Hard, grain-fed, 100 to 250 lbs., 16½, do, 250 to 300 lbs., 16; do, 300 to 400, 15.

Moran & Co's. live stock market, delivered and weighed off cars at their plant in South San Francisco:

Cattle—Good grass steers, 1000 to 1200 lbs., 10@12½; medium to good grass steers, 950 and over, 9@10; good heifers, 1000 and over, 8½@9; good cows, 1000 and over, 8@8½; medium to good cows, 900 and over, 7½@8; canner cows, 4@5; good bulls, 5@6½; calves, light, 12.

Hogs—Top packer hogs, hard and well finished; 175 to 250 lbs., 16½; 150 to 175 lbs., 16; 250 to 300 lbs., 16; over 300 pounds, 16; under 150 lbs., 16. Usual dock and price discount for other weights and kinds.

POTATOES

Potatoes: Per 100 lbs.: River, choice 1.85@2.00; fancy 2.00@2.40; sweet, lb., 5@5½.

ONIONS

Onions: Onions, fancy, 2.00@2.15; choice, 1.85@2.00; Garlic, 20@21.

VEGETABLES

Wholesale selling price:

Beans: String, 3@3½; Blue Lake, 4½@4¾; Wax, 3@3½; Pole, 2¾@4; Limas, 4@6½; Italian, 3@4½.

Cabbage, doz., 40@55.

Celery, doz., 20@25.

Cucumbers: Large box, 60@75. Pickling, lb. 6.

Corn, doz., 10@20; sack 1.25@1.75.

Eggplant, southern, fy., 50@65.

Lettuce, doz., 25@35.

Peppers, Bell, lb., 75@1.00; Chili, 7@11; Wax, bx. 33.

Peas, lb., 6@7½.

Radish, 7@9 doz. bunches.

Rhubarb, Strawberry, lb., 6, Mammoth, bx., 1.25@1.50.

Spinach, 75@1.25.

Tomatoes: Sacramento River, 50@1.00; Bay, 50@90.

Squash: Summer, cr., 50@65; Italian, 50@75 bx.

CITRUS

Wholesale selling price:

Per box: Lemons, fancy, 6.50@7.00; choice, 5.50@6.00; standards, 4.00@4.50; lemonettes, 4.00@4.50; grapefruit, fancy, 3.00@5.00; choice, 3.00@4.00; oranges, 4.00@4.50.

FRESH FRUITS

Wholesale selling price:

Apples: New crab, 1.20@1.50 for 20-lb. box; Gravensteins, 2.50@3.00 bx.; ch. 1.75@2.25; Alexanders, 1.75@2.25 bx.; Grecnings, 1.75@2.25; Fall Pippins, 2.00@2.25.

Bananas, 7@8.

Blackberries: So. 8.00@9.00.

Cantaloupes: Per crate, 50@1.25; pony crate, 35@60; flats, 25@35; Honey Dew Figs, double layer: 1.50@2.00 bx.; Brunswick, 75@1.00, single layer.

Grapes: Thompson seedless, 75@1.25 per box; Malaga, 75@1.25, Los Angeles lug; Fontainbleau, 75@1.00 per crate; Rose Peru, 75@1.00.

Why:::::::

Norwalk Tires
wear longer

1. Non-skid covers 80 per cent of the tires wearing surface.

2. The rubber by actual test is tougher than any other.

3. 529 rubber rivets to each square inch of fabric.

4. Norwalk deckle splice prevents air pockets.

5. Hand-made construction.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards, the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

For Sick Chickens

Preventive and curative of colds, roup, canker, swelled head, sore head, chicken pox, limber neck, sour crop, cholera, bowel trouble, etc. Mrs. T. A. Morley of Gallen, Mich., says: "Have used Germozone 17 yrs. for chickens and could not get along without it." Geo. F. Vickerman, Rockdale, N. Y., says: "Have used Germozone 12 years; the best for bowel troubles I ever found." Frank Siuka, Chicago, Ill., writes: "I have lost but 1 pigeon and no chickens in the 3 yrs. I have been using Germozone." C. O. Petrein, Moline, Ill.: "I never had a sick chick all last season." Bernard Hornfng, Kirksville, Mo., says: "Cured my puniest chicks this spring." Ralph Wurst, Erie, Pa., says: "Not a case of white diarrhoea in 3 yrs. I raise over a thousand a year." Good also for rabbits, birds, pet stock.

GERMOZONE is sold generally at drug and seed stores. Don't risk a substitute. We mail from Omaha postpaid in new 25c, 75c and $1.50 sizes. Poultry books free.

GEO. H. LEE CO., Dept. 415 OMAHA, NEB.

TiziT TiziT

WHY?

In one district in Los Angeles County where Tizit spray has been used for five years there are twenty growers using it where one used it before. Why?

Because—

Tizit has met every claim we make for it.

Because—

The grower who has looked on and waited to see what was going to happen to the other fellow—spending the while twice as much in his unsuccessful efforts to clean his own trees—has awakened to the fact that for years he has been passing up "inverted commerce"; that for years he has been passing up the best friend the citrus grower has ever had in his many years of fighting the pests that infest his trees.

Why Don't YOU Make a FRIEND of TIZIT?

Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.
Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00 @54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of September 10, Scott, Wagner & Miller says:
Receipts past week 2809 tons. Labor Day no work was done in the line of loading or discharging cars or boats and the arrival of the Fleet caused many to come to the city allowing shipping to wait their return. This, in conjunction with the shortage of cars which is becoming more stringent daily, has had the effect of cutting down receipts. During the week the government received bids for about four thousand tons of hay for shipment to Manila and Honolulu. This hay to be double compressed. In all probability award for this hay will be made to San Francisco bidders. Other than this call, there has been no particular demand, and hay has not moved to as good advantage as it did during the previous weeks. This would indicate that consumers are becoming stocked up with their winter supplies. Fancy wheat and red oat hay, which usually arrives by rail, have been somewhat scarce and therefore in demand. There is no inquiry for straw and heavy offerings of same are being made without many sales being effected.
We quote today wholesale prices in carload lots as apnear from dealers' transfers upon the Hay Market—for prices to consumer, charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay (light 5-wire bales)	17.50@19.00
No. 1 Wheat or Wheat and Oat Hay	15.00@18.00
No. 2 Wheat or Wheat and Oat Hay	12.00@15.00
Choice Tame Oat Hay	15.00@18.00
Other Tame Oat Hay	12.00@15.00
Wild Oat Hay	10.00@14.00
Barley Hay	12.00@16.00
Alfalfa Hay	17.00@22.00
Stock Hay	8.00@12.00
No. 1 Barley Straw, bale	50@80

Citrus Markets

Los Angeles, Sept. 10.

Valencias going forward satisfactorily after the strike. Owing to reduced stocks in markets Eastern prices are somewhat higher. Demand is good.
Lemons occasionally commanding long prices.

Shipments

Shipments of citrus fruits to date since November 1, 1918; Southern California: Oranges, 31,329 cars, lemons 8884, total 40,213. To same date last season: oranges, 13,453, lemons 5362, total 18,815. Central California this season: oranges, 4427, lemons 354, total 4781. To same date last season: oranges, 2539, lemons 115, total 2654. Northern California: oranges, 244, lemons 2, total 246. Last year same date: oranges, 203.

Some Potato Diseases

By Charles L. Fenton

IT is just the plain simple fact that potato growers all over the country have been sleeping while fiendish bacteria and impish bugs have combined to try to drive our unprepared spud clear off the earth.

But now we are awake. Our live-wire state director of agriculture, George H. Hecks, sent out the S. O. S. at Riverside recently, and it was voted unanimously to sound the call for all potato growers to join the fight against potato diseases.

Now, down to a few plain words about bugs and bacteria:

Spindling Sprout

This is just plain weakness of constitution due perhaps to running out of the race. The seed has, mayhap, been grown too long in the same unfavorable conditions. It sends forth a lot of slender weak sprouts, grows to a dwarfed top and presents a poor yield of scrub spuds.

The remedy is seed selection from best yielding, most robust plants and best yielding high grade tubers for several years until a pedigree is established. Some immediate good will result from testing the seed before planting and discarding such seed as throw out the spindle sprouts. If the tubers have been kept cool and dark and well ventilated in storage they are more apt to hold their vitality.

Curly Dwarf

This disease is also inherited. Most spuds have been propagated from slices off the parent so long that strength from the original source is sometimes lost. The plants are dwarfed, with leaves crinkled and rolled downward. Tubers are few and small.

The remedy is hill selection of seed from best plants or by destroying the affected plants as soon as discovered. If the whole field is affected, pocket the loss but don't plant seed pieces from that field for the next crop and don't sell the mongrel stock to some innocent grower, explaining that they are a little under sized but just right for seed.

Two Blights

There is early blight, or leaf blight, and late blight which may affect leaf, stem and tuber. Late blight is not common in this section. Early blight is indicated by brown spots on the leaves. The whole plant is sometimes killed before the tubers are half grown.

The remedy is to spray with Bordeaux; four pounds bluestone, five pounds quicklime, to 50 gallons water when plants are six inches high and repeat two or three times as needed.

We are fortunate in not having the Colorado potato bug and not much blight but we have fusarium wilt which is a bad actor.

Fusarium Wilt

This disease appears in yellowish brown rings around the inside of the tuber, starting at the stem end. There are wilted blackish spots just before rot sets in. It appears on the stems under ground and above ground, causing the plants to turn yellow and die quite rapidly. There is no stopping the disease on a plant except to destroy the plant. That does not add any immediate profit to the grower's pocket but it may pay in the long run to go through the field and rogue out the affected plants.

Prevention is possible if cure is not. Select seed free from the disease at time of cutting. Practice hill selection, of course watching lest the least trace of the disease is found on the hills chosen for seed. If this disease gets established in the soil the fiendish bacteria will stay there for six or seven years even when no potatoes or tomatoes are grown there. If one continues to supply the bacteria with potato plants the soil will continue to get sicker. In some sections it is already sickest and spuds are strangers there.

Potato Scab

This "scab" belongs to the union of diseases which fights the capital of the grower by lowering the market price of the spuds it joins itself to. It is simply a scabby, scaly surface, and like a cancer eats down so that a lot of peeling has to be done to properly dress or undress Mr. Spud.

The remedy is dipping the seed in corrosive sublimate solution four ounces to 30 gallons water for one and one-half to two hours in a wooden vessel and cutting and planting immediately. In heavy damp, poorly drained and poorly aereated soil the scab acts its worst. Practice crop rotation.

Rhizoctonia

This satanic member of the combination chooses to disguise himself as wart like dirty specks on the tubers that will not rub off because they are more than "skin deep." It does not hinder the cook as much as scab but it lowers the yield more because it affects the stem of the plant, causing it to turn brown and shrivel and the foliage to turn yellow before the crop is mature.

The remedy is dipping in corrosive sublimate the same as for scab and also seed selection at time of cutting, plus crop rotation.

Flea Beetles

Some insect members of the enemy of potatoes, need arresting. The first are flea beetles. These small brown jumping imps eat holes in the leaves and thus prepare the way for their allies, the fungus diseases. The young of the beetles as larvae or worms feed upon the roots and stems under ground.

The remedy is to spray with a combination spray of Bordeaux, as recommended above for blight plus about 7 pounds of lead arsenate paste to 100 gallons of the Bordeaux solution. Repeat if necessary. The arsenate poisons the leaf eaters while the Bordeaux tends to drive them away.

Leaf hoppers are sometimes found on potatoes, especially near alfalfa fields. They are small, slender, quick jumping insects which feed on the undersides of the leaves. They do not often get serious enough to require spraying. They are controlled when numerous by spraying with an angle mist nozzle, using Blackleaf 40 one pint; fish oil soap, five pounds; water 130 gallons, or in small amounts one teaspoon of Blackleaf 40 to one gallon of soapy water.

Tuber Moth

The tuber moth lays its egg on the potatoes at night. The eggs hatch and the worms bore into the tubers. The damage is serious in many sections.

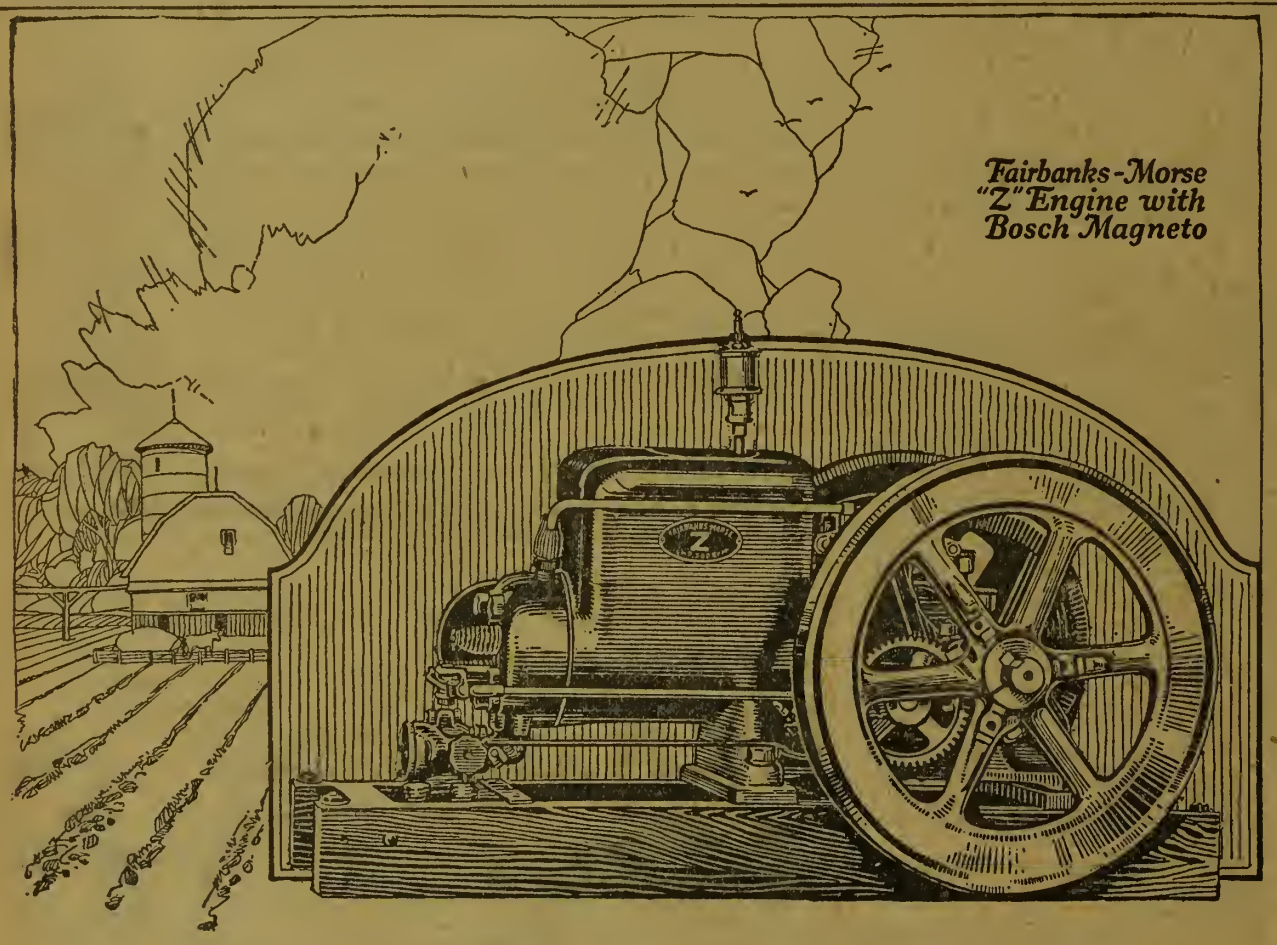
Care must be had to keep the potatoes well hilled up in the field. The moth will crawl down into the cracks and will discover any exposed tubers. At harvest time potatoes must not be left exposed after sundown. Covering with vines or straw is not sufficient. They must be covered closely with sacks or with canvas. Fumigating the potatoes in storage with carbon bisulphide gas will destroy the larvae.

Wire Worms and Nematodes

Wireworms are tough yellowish jointed worms from one to two inches long which attack the tuber. The adult form is the black click beetle. Starve them by summer and fall plowing and harrowing. Dry fallow may starve them but is expensive and produces no crop. Practice crop rotation and clean up all trash in the field which might give shelter for the adults over winter.

Nematodes are minute worms (eel worms) not seen with the naked eye. They cause a rough warty appearance of the tubers. They work on many plants in light sandy soils, producing knotty roots.

There is no method of control except to vary the crops, planting grasses, alfalfa, etc., the roots of which are not badly attacked. Letting the ground dry out and plowing and cultivating dry for two seasons is pretty expensive but in extreme cases is necessary.



SINCE the "Z" was put on the market, over 250,000 farmer buyers have pronounced it the greatest farm engine value. ¶ We felt the same way about it. ¶ But following our policy to improve our product whenever possible, we are highly pleased to announce a new Fairbanks-Morse "Z" with Bosch Magneto—high tension ignition which adds the one possible betterment. ¶ Call on the "Z" dealer near you—see this world's greatest engine—understand the full meaning for you of the engine service which over 200 Bosch Service Stations give, in co-operation with every "Z" dealer, to every "Z" engine buyer. ¶ Prices—1½ H. P. $75.00—3 H. P. $125.00—6 H. P. $200.00—All F.O.B. Factory.

Fairbanks, Morse & Co.
MANUFACTURERS CHICAGO

THE LATEST ON GRAPE SYRUP

Continued from Page 361.

cussed in Bulletin 303. It is believed that its commercial production warrants serious consideration.

Existing Plants Can Be Utilized for Grape Syrup Making

The large wineries possess ample crushing, pressing and filtering equipment, tanks and vats. They could install the necessary vacuum pans, pasteurizers, and canning equipment to produce a red syrup described under "2" or a neutral white syrup as described under "3." The red syrup could be sold as such or used for blending; while the white syrup would be used for blending with Muscat syrup made by the freezing process.

Existing breweries would with slight additional crushing and pressing equipment be well adapted to manufacture syrup by the freezing process. All large lager beer breweries are fully equipped with refrigerating and ice making machinery, as well as large freezing rooms, tanks, etc. All have large steam plants as well, so that vacuum pans could also be installed and syrup be made by both processes. The field is worthy of the attention of California brewing companies.

Summary

It has been proven by repeated experiments upon a large laboratory scale that a red grape syrup of fresh grape flavor can be made from wine grapes by combining grape syrup made by the freezing process with that made by concentrating red juice in a vacuum pan. If for table use, Muscat grapes may be used to excellent advantage to furnish flavor.

A red syrup of deep color and jelly like flavor and suitable for table use and wine making, may be made from wine grapes by heating the juice and skins to extract the color and then concentrating the filtered juice in a vacuum pan.

An excellent white table syrup of strong Muscat flavor may be made by partially neutralizing with chalk, filtering, and concentrating in a vacuum pan, juice from wine grapes and combining this syrup with 25 per cent of its volume of Muscat syrup produced by the freezing process.

Success of the vacuum process depends upon leaving the liquid in the vacuum pan as short a time as possible; never to exceed one and one-half hours. Long heating destroys color and flavor and induces caramelization.

Red grape syrup is much smaller in bulk than an equivalent amount of raisins; is of less weight; is very convenient to dissolve and dilute with water; possesses more of the fresh grape flavor and color than raisins and has a greater range of uses. For these reasons grape syrup should supplant dried wine grapes, even for export for wine making purposes.

Existing wineries and breweries already possess the most expensive parts of the buildings and equipment needed for the manufacture of grape syrups. Their commercial production should, therefore, be seriously investigated by such organizations with a view to turning the otherwise idle plants to profitable use.

Raising Small Fruits in California

By J. W. Mills

NEARLY all parts of California will grow small fruits, but there are soils and climatic conditions which raise them to perfection. This is especially true in the warm belt along the coast. If grown on a large scale one must have a ready and not too overburdened market as the fruit perishes so quickly. Then, again, as the season of ripening is short, be sure of the labor situation.

Cultivation

Successful growing of all small fruits depends upon the care given.

Give a thorough cultivation of the soil before planting and frequent shallow cultivation after, in order not to injure the roots. Keep the weeds down as the moisture must be conserved.

Propagation

Small fruits are very easily propagated, which is an important factor to the man of small means.

Blackberries and red raspberries are propagated in two ways, by suckers and root cuttings. The former is the better way for family use.

Loganberries, dewberries and the black raspberries are propagated by tip layering, that is, bending down a cane and covering lightly with dirt until it roots.

Strawberries are propagated by means of runners.

Gooseberries and currants are obtained from cuttings or layerings.

Planting

Blackberries should be set out in February in rows from six to eight feet apart with the plants four to six feet apart in the rows. The trailing varieties, such as the Mammoth, require from seven to eight feet apart and eight to sixteen feet apart in the rows. The same is true of the loganberries.

Raspberries are usually planted the same as the blackberries but may be profitably grown nearer together.

Strawberries are usually grown in raised beds in double rows.

The furrow between the rows serves as an irrigation ditch and a walk. This prevents the picker from tramping the soil around the plants. Strawberries require greater care in planting than any other of the small fruits. Young plants must be used and not allowed to dry out while planting. The strawberry bed is usually a permanent bed.

Gooseberries and currants are usually planted in rows two and one-half feet apart to five feet apart in the rows and the rows from five to six feet apart. Currants do well between certain orchard trees, as the cherry, apple and pear.

Pruning

Blackberries, raspberries, dewberries and loganberries produce fruit once on canes of one season's growth. Hence, after fruiting, all old canes should be cut out. New canes come up around the crown as suckers, but they should be thinned out to five or seven strong healthy canes. This should be done during the winter. These canes may be tied to upright stakes or trained to run on wire trellies.

Pruning of currants and gooseberries is entirely different. They grow more compactly than the brambles and may be pruned to a tree form or allowed to grow bushy which seems to be the better way as the borer does not trouble the bush so much in that form. Remove all dead wood and thin the new shoots. In the summer pinch the new growth in order to cause a dense foliage which is necessary to secure the best fruit. Most of the fruit is borne from short spurs on two and three-year-old wood.

Bearing

Blackberries and raspberries usually produce some fruit the second season after planting and fruit profitably for about eight years, when they should be taken out.

Currants and gooseberries do not bear well until the third season after planting and reach their maturity about the eighth year.

Strawberries if well cared for will produce luscious fruit until the plants are ten years old, but are not a profitable crop after the fifth year.

Varieties

Blackberries: Lawton, Kittatinny, Early Harvest and Crandall are the best known varieties in California and the Mammoth for the trailing kind.

Raspberries: The Cuthbert (red variety) is most extensively grown and has been found to be a constant bearer. Of the black variety, the Gregg seems to be most in demand, but only for family use as there is no market for them.

Strawberries: There are a number of varieties to choose from in the strawberry list. Marshall, Sharpless, Prolific and Gold Dollar seem to be most widely grown.

Currants and Gooseberries: The Cherry currant and Fay's Prolific have the preference in the currant line; Houghton's Seedling, Berkeley Champion are the most favorably known of the gooseberries.

More Than a Yard Every Second

When You Use This Handy

MERRY GARDEN AUTO CULTIVATOR

THINK what it means to cultivate your crops at the speed of from 120 to 200 feet per minute—more than a yard every second! And not merely scratch up the surface, but really work down deep—five or six inches and within one-half inch of the plants — without the push, pull or bearing down that wears you out. That is the kind of service you get from the MERRY GARDEN AUTO CULTIVATOR.

Saves the Work of Three Men

Actual tests prove one man with a MERRY GARDEN does more work and does it easier and bettter than four men do with hand cultivators. It works uniformly without slighting a single row. Goes between wide rows and astride narrow rows.

Simple to Operate

The power is furnished by a reliable 2 h. p. gasoline motor controlled from the handles. Requires no pushing or pulling. Simply guide it along the rows. "It leads the way." When not used as a cultivator, the addition of a pulley frame furnishes power for small machine, such as the separator, churn, lawn mower, saw or grinder. Price of frame, $10 extra.

Sold on a Money-Back Guarantee

We allow a 5-day trial, backed by a rigid money-back guarantee. Order direct from this advertisement, as you are fully protected by this guarantee. If for any reason the MERRY GARDEN fails to do the work, purchaser in accepting same agrees to notify us within 5 days from receipt thereof. We reserve the right to send a demonstrator, and if machine fails, purchase money will be refunded. Price $185.00, f. o. b. Cleveland, Ohio. Terms 10 per cent, or $18.50, with order. Balance on delivery, with privilege of examination subject to five-day trial and guarantee. Shipping weight 250 pounds. For further information and particulars, address

The Atlantic Machine & Mfg. Co.
450 W. Prospect Ave., Cleveland, O.

Gentlemen: Find enclosed $18.50 for which ship the Merry Garden Auto Cultivator, balance to be paid on delivery. This order is placed subject to the terms of your money back offer.

Direct Drive Conserves Power *in*

12 H. P. on Draw-Bar

25 H. P. on Belt Pulley

THE HUBER Light Four

Draws three bottoms

Turns an acre an hour

TRACTOR economy and tractor power depend largely on the proportion of the power developed by the motor that is delivered to the draw-bar.

In simplicity and economy the direct spur gear drive of the Huber Light Four is unequalled. There are no bevel gears—simply a friction clutch and spur gear reduction to the driving wheels.

Other reasons why the Huber develops such large power in proportion to its weight are: the high wheels roll easier and afford a larger area of "traction grip"; center draft conserves power by avoiding "side pull"; high-grade extra strong materials reduce weight.

These features are the result of 20 years' development. They are behind the Huber reliability that has created thousands of satisfied Huber owners.

Weight 5,000 pounds; pulls three 14" bottom plows; 12 h. p. delivered to the draw-bar; 25 h. p. at the belt; Waukesha, four-cylinder motor; Perfex Radiator; Hyatt Roller Bearings; burns gasoline, kerosene or distillate; center draft; two speeds, 2½ and 4 miles per hour.

Write for "The Tractor in the Making". It tells the interesting history of tractor development.

MOLINE WIDE SPREAD SPREADER

With Straw Spreading Attachment

With this spreader you can drive through doors and narrow places, as the box is only 38 inches wide, yet you can spread the manure in a wide even sheet.

It is low down, easy to load, strongly constructed, light in draft, and the second beater thoroughly pulverizes the manure, spreading it in a wide, even sheet beyond the wheel tracks. One lever operates the entire spreader.

This spreader can also be equipped with a straw spreading attachment which is illustrated here. It is easily attached and spreads straw in a wide, even sheet, as thinly as you desire, even on windy days.

Straw is worth from $4 to $8 a ton as fertilizer and as a top dressing for winter wheat.

You can make more profit from your manure and straw with this Moline spreader.

See your Moline Dealer now about getting one or write us for full information.

More and Better Wheat

By Norman F. D'Evelyn

AS PLANTING time approaches our grain farmers, present and prospective, have to face the issue of what to plant. Many of them will find their answer in the slogan that has been sounded in a systematic, aggressive way for the last year throughout the grain growing districts of the state: "Plant More and Better Wheat." Last year's campaign and this year's harvest certainly have done much to dispel some pretty firmly held theories that have been used as arguments against more wheat, and these same factors have pointed out and proved out in impressive fashion the way to better wheat.

This year there will not be the same patriotic incentive that during the war was such a great factor in stimulating the maximum production of wheat. However, in spite of the remarkable increase realized last year California's production is still far below her consumption of wheat. The same economic reasons, therefore, should make the planting of wheat attractive to the grain farmer the coming season.

The headway made last year could be regarded as much more secure and permanent were it not for the present remarkably high price of barley. At the beginning of this year only the most optimistic could have realized that barley would reach the high price it commanded a few months later, and still commands. At the same time the thoughtless have been quick to jump at the conclusion that since the government guarantee is removed, the price of wheat will drop precipitately.

Besides the determination to follow up in a logical way the experimental and development work already done, these two—the respective future prices of wheat and barley—considerations, which have led up to what is regarded as false conclusions, have prompted the agricultural department of the Sperry Flour Company to renew in a systematic and thorough-growing way its "Plant More and Better Wheat" campaign. A series of weekly bulletins has been issued to a list of some 1600 wheat growers in California who were in touch with the department last year. The cooperation of the milling industry generally and of the commercial organizations, the press and other agencies, has been invited, and their participation has been suggested to the end that California's wheat production may reach a parity with her consumption.

The campaign is in charge of George R. McLeod, head of the department, who handled the program carried forward so successfully last year, and he will be assisted by B. D. Ingels, chief chemist, in charge of the company's wheat exhibit at the California state fair.

As to the prospects for barley, it is pointed out that California's principal market is Europe, but the approaching crop of corn, estimated at 72,000,000 tons for the United States, together with 25,000,000 tons of oats and barley, will provide an enormous supply from which Europe can draw, besides the 50,000 tons per week being shipped to Europe from Argentina. American farmers who raised wheat last year for patriotic reasons will again turn to corn, oats or barley and other crops more suited to their land, making for an increased production of coarse grains and a decreased production of wheat. There is every indication that next summer Europe will be in a position to buy her normal requirements of the coarse grains at a substantially lower price. On the other hand every factor points to a high price for wheat in 1920, a price that will be governed solely by the world's demand.

Bearing out this statement the following analysis compiled with extreme care is presented:

According to Mr. Hoover, Europe will require this year a minimum of 700,000,000 bushels of wheat and a maximum of 850,000,000 bushels. Recent estimates indicate that the United States will produce 940,000,000 bushels instead of a billion and a quarter as per estimates of May first.

San Joaquin County Way of Helping Feed the World

Field of early maturing wheat in San Joaquin County. George R. McLeod of Sperry's agricultural department is examining the wheat.

Our requirements for human consumption, for stock and poultry feeds, for carry over and for seed will amount to 700,000,000 bushels, leaving for export only 300,000,000 bushels.

The export surplus in Australia and Argentina amounts to 500,000,000 bushels, but recent reports indicate that 50,000,000 bushels of Australian wheat must be shipped to famine stricken India. Therefore the total world's surplus for export to Europe will be only 750,000,000 bushels. This is 100,000,000 bushels less than the maximum European requirements and makes no provision for shipments to the suffering millions of Russia.

The situation in 1920 will be little better. Russia cannot possibly get on her feet for several years. India will require most of her new crop to replenish stocks. The surplus in Argentina and Australia will be used up Europe must get her total wheat from the crop harvested in 1920.

Considering that Europe will increase her own harvest to equal her own increased consumption, due to high prices of other foods, we make the following tabuation of exports to Europe:

	Pre War	1920 Estimate
United States	100,000,000	300,000,000
Canada	92,000,000	100,000,000
Australia	50,000,000	100,000,000
India	51,000,000	None
Russia	162,000,000	None
Argentina	106,566,000	150,000,000
Total	561,566,000	650,000,000

One of the most encouraging aspects of the whole situation has been the convincing proof of the fallacy of the

theory that California wheat lands have worn out, for last year and this year many fields produced as big crops as they did 35 years ago. There have been many striking instances, too, of wheat growing alongside of barley and making the better crop, and farmers have become impressed with the fact that wheat will do better on land that is not well drained than barley will, and that wheat is better adapted to localities which have frosts than is barley.

No doubt the biggest factor in bringing wheat back into favor has been the introduction of early maturing wheats such as Early Baart and Bunyip, both developed on Sperry experimental farms. These varieties have made it possible to produce from ten to 14 sacks of wheat on land that would grow not more than six or eight sacks of Bluestem wheat. In view of the fact that there is insufficient rain in seven out of ten springs in California, the early maturing wheats have the advantage over what have been standard varieties of being far enough advanced to be less susceptible to drought.

Assuming that the grain grower has decided to plant wheat, there are a number of factors that must have serious consideration. Soil preparation is certainly not the least important. The soil may contain in ample quantity the ingredients making for fertility, but unless these are available the farmer is no better off than if he were farming on a barren plain.

Probably the most successful California method of rendering the insoluble ingredients of the soil available for wheat is by summer fallowing, and if his lands produce no crop next season the farmer should be comforted by a realization that the following harvest will have made the apparent sacrifice a mighty good investment. The land should be plowed in the fall after the first rains and allowed to stand rough through the winter. In the spring it should again be plowed and also harrowed to make a covering to retain the moisture.

If in the following fall there are early rains, it is best to allow the weed seeds, etc., to germinate and get a good start, and then plow these under and seed before November 15 if possible. If no early rains come the seed should be drilled in the dry ground so that it will be ready to germinate when the rains do come, and thus have a chance to get ahead of the weeds.

There are no practical methods of crop rotation that have worked to advantage in California. However, there have been marked improvements in the yield and quality of wheat grown on lands which have had two or more crops of beans or alfalfa on them. In fact old alfalfa land could in most cases be advantageously planted to wheat for a couple of years. Twenty sacks of wheat is no unusual harvest from an acre of good alfalfa land.

Wheat also makes a good crop to rotate with rice. The land is full of the weeds that grow with wheat. And two years of wheat will eliminate the water grass of the rice fields. Incidentally there is a decided increase in the yield of wheat, due to an improvement of the soil conditions by rice culture.

The principles of dry farming are very applicable to California wheat production. The conservation of moisture by so plowing the soil that it will hold the moisture and by so harrowing, and sometimes mulching the top dirt, that the moisture will be retained, is of vital importance.

Plowing loosens up the soil so that it becomes like a sponge and retains great quantities of water. Then by forming a blanket or covering of finely pulverized dirt over this reservoir, sufficient moisture is retained to assure plant growth during the months of April and May, which are so often without rainfall.

Certain clay soils have a tendency to form hard top crusts when this blanket is too finely divided. Especially is this true when the winter rains are very heavy. In such cases it is necessary to harrow the land in the early spring, and even if some of the wheat plants, three or four inches high, are destroyed, the remainder of the plants are so much benefited that the yield is very materially increased.

A hard crust not only keeps out the air which is just as essential as water for plant growth, but it also acts as a capillary evaporator and removes the moisture much more rapidly than otherwise.

On many farms the plow sole formed by plowing at the same depth for several years, becomes such an established condition that one does not realize the damage it does to his land. Practically all the plant food and moisture that the grain receives must be obtained from the soil above this pan—neither the plant roots nor water will readily penetrate it. The proper procedure is to break this plowsole up so that a larger reservoir of moisture can be formed and more food become available. Every low spot must be filled if a maximum yield is to be obtained. Ditches should be provided to carry off surplus water.

Finally, the wheat grower should bear in mind these essentials:

Select the variety that is adapted to the conditions under which the crop will be grown.

Get the best seed and clean it thoroughly.

Keep after the weeds. It may be necessary to pasture summer fallowed lands with sheep so that undesirable plants can not develop beyond the blossoming stage. It takes two years to overcome morning glory and some other weeds in this way. Black oats can be plowed under when three or four inches high in loose soil after fall rains. By cutting the wheat with a binder it is often possible to get rid of the weeds before their seeds mature. If a combined harvester is used see to it that none of the weed seeds get back on to the land. To harvest weeds means increased cost of bags, freight, storage and milling expenses

FINDING TRUCKS' EFFECT ON ROADS

To determine the destructive effect of heavily loaded auto trucks on highways and streets, and to meet the demand for data on the design of road surfaces and foundations to withstand such heavy traffic, a series of experiments is being conducted by the bureau of public roads, United States department of agriculture, at the Arlington experimental farm to determine the impact of auto trucks on roads.

The most striking single development in the highway field in 1918 was the tremendous increase in motor truck traffic. Five years ago heavy motor trucks were few in number and limited practically entirely to the paved streets of larger cities. These vehicles now comprise probably four or five per cent of the grand total of all motor vehicles and are to be found wherever traffic conditions permit profitable use. But very few roads were designed to carry any large volume of this class of traffic. Consequently, the cost of adequate maintenance was increased greatly during the year. In many places the damage due to the incessant pounding of these fast and heavy vehicles was so great as to require complete reconstruction.

TO COMPLETE OLD NATIONAL ROAD

A project under the federal aid road act, filed with the bureau of public roads, United States department of agriculture, which will undoubtedly hold the record for length and cost for some time to come, is of unusual interest aside from its great length and cost. It contemplates, after the lapse of nearly a century, the completion of the Old National Road, extending from the Potomac to the Mississippi, which already has been largely improved as far west as the Indiana line.

The proposed type of surface is monolithic brick and concrete pavement, the average cost of which is about $30,000 per mile.

Based on complete reports from 44 of the states cash expenditures on the rural roads and bridges of the United States for the calendar year 1918 amounted to $286,098,193. To this should be added the value of statute and convict labor, which can not be fixed with any great degree of accuracy but probably amounted to not less than $14,000,000, thus making the grand total expenditures for the year $300,000,000.

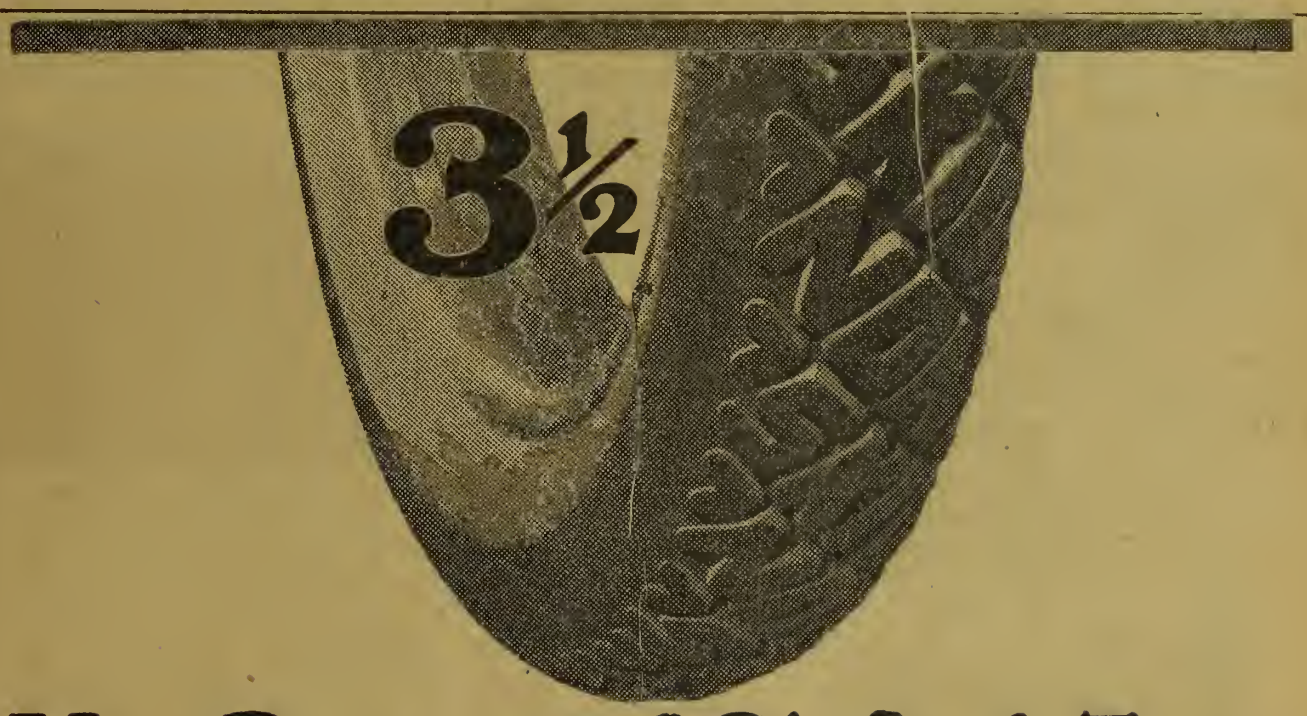
ACTING ON HIS TIP

A false charge had been brought at his court, and the magistrate remarked: "We are all liable to make mistakes. I thought I was wearing my watch, but I have just discovered that I have left it at home."

When he arrived at home that evening his wife said to him:

"I hope you got your watch all right. I gave it to the man from the court who called for it."—Dallas News.

Stocks of Egyptian cotton on hand in Alexandria, Egypt, July 18, according to the United States bureau of markets, totalled 261,000 bales as against 220,000 bales last year at the same date, and 84,000 bales two years ago. The total visible world's supply of cotton, all classes, July 18 was 4,927,937 bales, over one and a half million bales more than last year.



You Buyers of 3½ Inch Tires

You represent over half the tire buyers of the world. You deserve special consideration. Your volume of demand calls for the biggest value.

Recognizing this, Firestone has built a special $7,000,000 factory for you, designed special machinery for your tire and special looms to weave your fabric.

And this factory is operated by an organization devoted entirely to your requirements. The methods and machinery leave no room for errors or flaws. Result: This special molded tire is the nearest thing to a perfect tire that engineering can give you.

By saving from 10% to 30% on every factory operation, you get this tire at a price that some pay even for the "off brand" kinds. 30x3½, non-skid, $18; 32x3½, non-skid, $21.

You get a 6,000 mile adjustment basis, and you get it from Firestone—always in the front in value-giving and now years ahead of the field. Any one of the 42,000 dealers who bank on Firestone quality will put these money-saving tires on your car.

THE REAL MAN WITH THE HOE

These verses were written by Edward Berwick of Pacific Grove at the time of publication of Edwin Markham's famous "The Man with the Hoe." Mr. Berwich wrote these in protest against the Markham attitude.

We're tired of the drool and the drivel,
Lamentation and mourning and woe,
Supercilious Society's snivel
Daily fired at the man with the hoe.

Bipeds such as the painter has pictured,
And vast ink-shed has forced us to know,
May wear liv'ry of Gotham's "Four Hundred"
Full as oft as they're found with the hoe.

Crowns have circled slant brows of such creatures;
There are natures as bestial and low,
Demoniacs debasing God's features
In ranks that heap scorn on the hoe.

Such a man; such a hoe; stirs your pity;
Hoe and man are so surely "no go";
But you'll find just such men in your city,
Tho' they never set hands on a hoe.

The real man with the hoe is not hunting
Sham sentiment, maudlin and slow;
He's the man with true gun and bright bunting
Who goes when his country bids "go."

Boy in blue, he has ever been ready
When Columbia has needed a man
To stand in staunch ranks, firm and steady
Or fire-tip fierce charge in war's van.

This world's one relentless rude scrimmage;
Mad mortals amuck for "the dough";
But, when God planned a man in His image
He set him to work with the hoe.

Mother Earth can dispense with some classes.
Brush wielders, ink slingers may go;
But she can't spare that friend of the masses.
She must have the man with the hoe.

He's the "braw boy" our backbone is built of;
From his stock sturdy presidents grow;
Labor's King poets proudly may lilt of;
Hurrah for the man with the hoe!

THE PERFUME CLERK

(Continued from last week.)

"It's glorious to be at home," he resumed; "but I want to get back—as quickly as possible."

He looked at Alice, whose eyes had clouded.

"It's an awful thing—war," he said; "but now that it's come I don't want to miss my part of it."

A light that Alice had sometimes seen on his mother's face shot across his.

"Aren't you afraid of being killed, John?" Alice asked the question before she thought. She had not meant to say such a thing before his mother; but his mother smiled to herself in perfect peace.

"Of course I am sometimes," her son replied. "You see, that's something I don't fully understand. We always seem to be needlessly afraid of mysteries, and we're always finding out that they're harmless. I'm sure of this: if we knew about death, we'd know we were fools to fear it."

His mother broke in eagerly: "Yes, we won't think about it: we hide our heads, or we run away from it to lights and company; and when it comes, perhaps all it'll mean"—she looked at her newly returned son—"perhaps it'll be the face of some one we love."

WAYS TO FRESHEN WOOLENS

Washing with Soap and Water

Woolens may often be washed with lukewarm water and mild soap provided the color is fast.

Washing with Soap Bark

Soap bark is excellent for dark woolens which might streak or fade with ordinary soap (sailor suits and middy blouses, for example). It may be purchased cheaply at a drug store. Make a solution by boiling one cup soap bark (about three ounces) and one quart of water for five minutes; cool, strain, and mix with wash water like ordinary soap solution; or put the soap bark into a small thin bag and soak and squeeze it in the water. A little soap bark used in the rinse water gives the goods a slight stiffness.

Sponging and Pressing

Sponging and pressing are used to freshen garments or goods which are not soiled enough to need washing or will not stand it.

To remove wrinkles, use clear water.

To remove grease and dirt, use mild soap or soap bark dissolved in water, then clear water.

To remove shine, use one tablespoon ammonia to one quart water, then clear water.

Apply with a clean, soft, lintless cloth, a sponge, or a piece of the material itself. Sponge with light even strokes in the direction of the grain of the goods, using only a little moisture at a time.

Iron on the wrong side with a medium hot iron or press with a damp cloth over the right side. Brush up nap if too closely pressed down.

Steaming

Steaming is especially good for removing water spots. Work over a tub or bowl of very hot water or use one of the special steam spreaders which fit on the spout of a teakettle. Shake dry; or, in the case of outer garments dry on a hanger which holds the garment in shape.

Dry Cleaning

Dry cleaning is cleaning without wa-

TREES

By Clarence Ousley

Trees are the arms of Mother Earth lifted up in worship of her Maker. Where they are, Beauty dwells; where they are not, the land is ugly, though it be rich, for its richness is but greasy fatness and its gaudy raiment is but cheap imitation of forest finery.

Trees are the shelter of man and beast and bird; they furnish the roof above us, the shade about us, and the nesting places of love and song. They call children out to play; they entice sweethearts into leafy coverts to seal their vows with fond caresses; they console and gratefully reward old age. They are the fittest ornaments of wealth and the inalienable possessions of the poor who can enjoy them without having title to them. They are the masts that fly the flags of all nations and the sails of all the seas; they are the timbers that bridge forbidding streams; they bear the wires of the world's intelligence; they hold the rails that carry the traffic of the continents; they are the carved and polished furnishings of the home; they cradle the young and coffin the dead.

Trees are nature's prime sources of food; their fruits and nuts gave sustenance to the first tribes of men and are the sweetest and most nourishing of the earth's products.

Trees herald the spring with glorious banners of leaf and bloom; they clothe the autumn in garments of gold and royal purple; bared to the winter's cold, they are the harp of the winds, and they whisper the music of the infinite spaces.

Before the earth could be peopled it was set thick with trees; and when man has run his course and the race we know has disappeared in the completeness of its mission or perishes in the destruction of its trees, the earth will spring up again with new forests to shelter and sustain a new race of men and beasts and birds to work out a greater destiny. Perhaps if we are wise enough to replenish our wasting forests and to make ourselves worthy of the gift of trees we may be permitted to accomplish that greater destiny which the Mighty Forester, the Perfect Orchardist, the Loving Father requires in the fulfillment of His sublime purpose.

ter but not necessarily without liquids. There are two kinds of dry cleaning, one by the use of gasoline, benzine, or naphtha, which dissolves out the grease and thus frees the dirt; the other by the use of powders or meals which absorb it.

EGGS IN NEW WAYS

Some people do not like eggs, that is eggs plain fried, scrambled or boiled. But there are other ways of serving, ways that carry an appetizing addition that make the egg dish as satisfying as the still more expensive meat:

Spanish Eggs

Fry slices of bacon until brown and crisp; when done, remove to a hot plate. To the grease, add two tablespoons of honey and fry eggs in it, placing them, when done, on a bed of freshly boiled rice. Put a slice of bacon on top of each egg and turn over all a cup of thin cream sauce, smooth tomato sauce, or the fat and honey in which the eggs were fried

Eggs a la Lyonnaise

Boil some eggs hard, shell and chop coarsely and set aside. Peel and chop fine a small Spanish onion, fry in butter until lightly browned; then add a cup of rich broth, seasoning the chopped eggs; dredge with a little browned flour and stir, while the mixture thickens slightly, as it heats through. Turn on to toast slices and garnish with potato puffs.

Eggs in Overcoats

Scrub clean and bake medium-sized white potatoes; when done, cut off an end of each potato, scoop out the pulp with a small spoon, mash and season well; then fill the shells three-quarters full, standing them on end securely in a buttered pan. Break an egg in the top of each and set the pan in the oven long enough to re-heat the potato and set the eggs.

Anchovy Eggs

Boil the eggs hard. When cold and shelled, spread the eggs thingly with anchovy paste; then dip them in raw egg, roll them in crumbs and fry like croquettes. When done, drain them on paper, place on a hot plate and turn over them a cup of fish sauce.

Egg Fritters

Boil, peel and quarter the eggs lengthwise. Have ready a little plain fritter batter. Dip the egg quarters into the batter and fry them in deep fat. Then drain and serve with melted butter or any well flavored sauce.

French Poach

Cover the eggs with vinegar and let them stand over night. Rinse the eggs and boil them seven minutes. Take off the shell and lay the eggs carefully on slices of toast. Have ready a good cheese sauce, turn it over the eggs and garnish with sprays of fresh cress or parsley. The sauce is a rich cream, made not too thick with a quarter cup of grated cheese, added just before serving.

Syrian Eggs

Fry a minced onion in butter; when a delicate brown, add a half can of tomato and okra, first cutting the okra in small pieces. When the mixture is hot, add two and one-half cups of freshly boiled rice. Mix well, then turn the mixture into a shallow buttered dish. Break over the top as many eggs as there are persons to be served, making a little hollow with a teaspoon for each egg, so that they do not run off the top. Dust with pepper and salt, and put the dish in the oven long enough to set the eggs.

Eggs en Casserole

Boil the eggs until hard; peel, cut lengthwise, and devil the yolks, filling the white halves again and tying them together with a bit of thread Lay them in a buttered casserole with sausages, sliced potatoes and a sufficient quantity of brown sauce. Grate a little raw onion over the top, cover and cook in the oven for one-half hour.

To remove blood stains, soak in salt and water for some hours, then wring out and rub in a fresh supply of salt and water. Next wash in the ordinary way, with soap and warm water, boil, rinse and dry in sunshine

SUGAR SYRUP FROM HOME GROWN CANE

We often see the question asked: "How can I get the sugar out of the cane?" The answers are generally for large producers, and the home gardener who has raised a few hills to try what she can do gets little information.

Last year I thought I would try a way of my own, and it proved very satisfactory. I first cut the stalks into small pieces to handle easily. Then I peeled all the outside away from the pith and put the pith through the meat chopper, first with a moderate knife, then second and third times with the finest knife. There is always quite a quantity of juice comes out at the back of the grinder when using the sharpest knife, so to catch it all I put a cup on a chair and caught a cup full. This I put by itself. Then I covered the ground pith with water and boiled it till the sweetness was all in the water and the pith tasted like sawdust. I took it off the stove and strained it into another kettle, and when it had boiled till I thought the water was all boied out I put in the cup of pure juice and boiled it all together till it was the consistency wanted and it surely was a pure white syrup with no bitter or strong taste. I did not make it as thick as molasses. The longer you boil it the thicker it gets and the stronger it tastes. —A. E. W., Redondo.

HOT SCHOOL LUNCHES

Thirty-eight rural schools in Missouri are now serving hot lunches to their pupils, through the activities of home demonstration agents.

In many places the teacher and pupils made fireless cookers under the direction of the home demonstration agent, and at one school the boys made the kitchen table. Women in different communities donated oil stoves and cooking utensils, while each child provided his own dishes. In one instance the Ladies' Aid Society of a nearby church donated cups, spoons, and bowls. Cloak rooms have been converted into kitchenettes. The equipment was bought in most cases by the school board. When this was not possible, entertainments were given to buy equipment and supplies. In one district an entertainment was given by teacher and pupils and $75 was cleared. Twenty-five dollars was used to buy equipment and supplies, and the remaining fifty to buy a Liberty bond.

In Mississippi County a rural school of seven pupils, one boy and six girls raised a garden, canned and sold vegetables and bought an oil stove. The women of the community donated the remainder of the equipment. The hot lunches are supplemented by cans of vegetables that were kept for this purpose. A marked improvement in work, conduct and health, is reported in every school where the hot lunch has been tried.

Don't wait till you start to town to make out a list of the things that you want to get. Keep a penny pad and pencil hanging in the pantry and during the week jot down the needs as they become evident. A number of them will not be annoyingly forgotten then.

Don't be afraid of trying up to date methods—new ways of doing things. The new way may be an improvement on the old; if it isn't, it need not be followed again.

We may not at first see it, but almost always opportunities are hiding back of the difficulties—and it pays to hunt them out.

If you will hang your pictures facing the wall, then turn them over you will find that the crossed wire will keep them hanging straight.

Narrow white tape is more satisfactory than ribbon for at least the everyday corset covers. It is neat and strong and unharmed by innumerable launderings.

An excellent way to press mussed waists is to sprinkle your ironing sheet instead of the waist. The steam that rises as you iron will take out every crease.

With a table full of hungry men folks!

—mother is so *thankful* for her Great Majestic Range. It cooks the big dinners—with the baking, the boiling, the frying—all so conveniently, so quickly, and everything is done just wonderfully fine!

The Great Majestic Range is made in many styles and sizes. You may have *your* Majestic beautifully

Paneled with White or Blue Enamel on Doors and Splasher Back, if desired

Every Majestic has *all* the Majestic superiorities of construction: Body of charcoal iron, resists rust and lasts three times longer than steel; frame of unbreakable malleable iron, saves repairs; smooth nickel trimmings, stay bright; burnished cooking top, requires no polishing; air-tight oven, bakes perfectly, with little fuel. All parts *riveted*, and entire flue lining of pure ¼ inch *asbestos*, prevents waste of heat. Majestic prices the same everywhere, freight considered.

Go to your Majestic dealer and see the many other Majestic features, among them the Majestic Patented

Hot Water Reservoir

A Majestic dealer is in nearly every county in 42 states. There is one near *you*.

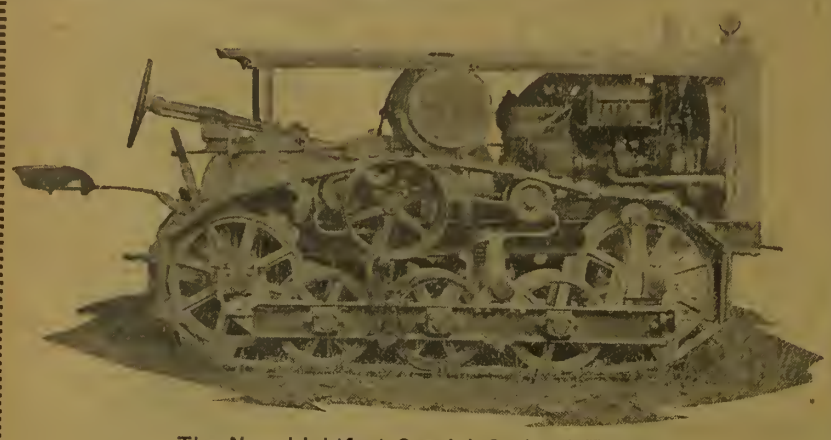
What? Buying

MONARCH Neverslip Lightfoot TRACTORS



The New Lightfoot Special Orchard Tractor

Why?

Because they are built in a size for every use or purpose Orchard or Farm, large or small, road or field, wet or dry adobe or sand. They plow the fields, market the crops and during the dull season level the sand hills and clean the Irrigation ditches. Truly a "Handy man" on the farm.

AND THEN

the track and truck repairs are eliminated because the shoe, track, chain and all other track wearing parts of tracklayers are eliminated and made In one inexpensive block of manganese steel which is practically indestructible and resists wear.

Besides, each size has an oversized heavy duty slow speed motor.

See us at our Warehouse and Sales Room 219-221 North Los Angeles Street, Los Angeles, California, as we will not be at the Demonstration.

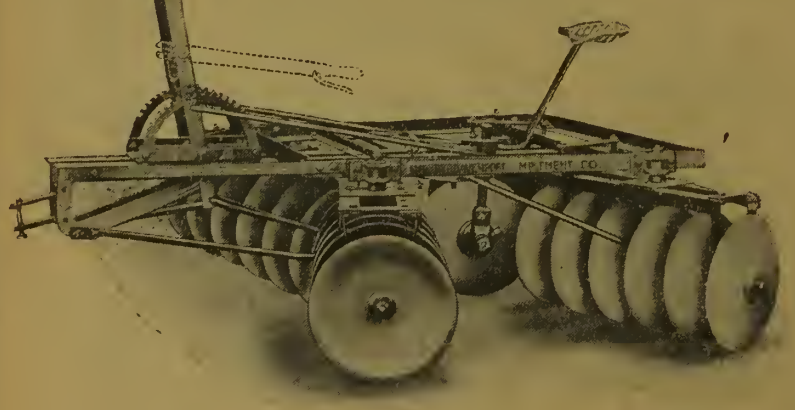
More Science and Less Draft
More Delivery and Less Power

The New Improved Davenport Doubleduty Disc is the last word in Disc construction for California Conditions.



Field operations—the actual performance and wearing ability of the Davenport Double duty disc harrow make it the most serviceable and dependable for California conditions. The above illustrates the improved model made in 6, 8, and 10 foot sizes for both horse and tractor power. No sturdier construction was ever offered.

The entire frame, excepting braces is of angle steel. The standards are one piece and are attached to slotted disc hangers permitting self adjustments.

The center disc is adjustable to any angle necessary to completely cut out the core. Bearings are of hard wood lubricated by grease which, forced in, keep dirt and grit out giving longer wear. All grease cups are easily accessible.

Levers are furnished either for tractor or horse power and special low levers are also furnished extra if needed to disk beneath trees.

Discs are standard 18 inch plain or cutaway pattern. There is no soil condition known in California suitable for farming under which this disc will not do satisfactory work and its especially sturdy construction is a guarantee of its wearing qualities that is backed by a factory that for years has been California's largest producer of disc harrows.

It is to your interest to buy implements of well known established home manufacturers, as you will be near the factory and receive prompt factory service.

A post card inquiry will bring an illustrated circular.

How One Woman Made Good

By Jean A. Koethen

WHEN Mrs. Clara J. Bell drifted from Chicago five years ago to California it was with the distinct purpose of making her home and her living here. Just how the latter end was to be accomplished she did not know, but surely in a country like this, so full of climate and sunshine, there must be a chance for everyone. As luck would have it, her fortune led her to Burbank, one of the many poultry communities adjacent to Los Angeles, and here Mrs. Bell found the chance she was looking for.

A good many women, she found, were making a fair living with poultry, not the easiest work in the world, but a business that always makes a living for the person who comes to it without prejudice and with sleeves rolled up. Mrs. Bell's sleeves were rolled up. "What one woman can do, another can," she told herself, and resolutely went to work.

But do not expect to hear that she started in with a thousand day-old chicks and made a fortune the first year. Mrs. Bell knew that she did not know very much about chickens. She began with eight old hens, which she bought for $1.25 apiece, just common hens, nothing more. They were kept in a Maltby coop, but in spite of confinement they laid, often eight eggs a day, never more, not often less. These eggs paid for their feed and provided the family with a tempting breakfast every day. Mrs. Bell figured: "If eight hens lay 200 each in a year, how many will it take to make me a living income?" and she thought she had the answer.

That fall she bought 250 White Leghorn pullets of good bred-to-lay stock. They were five months old and soon began to shell out the eggs so convincingly that she thought she might safely go a step farther. Early the next spring she took a real plunge and bought 2000 day-old chicks. She had now learned to feed layers for eggs and knew something about the care of brooder chicks, so the rest was fairly easy. From the 2000 chicks she raised 750 fine pullets. The cockerels, which were sold as broilers, paid for the chicks, with something over toward the keep of the pullets. When the pullets had been Hoganized, 700 standard-bred birds were left, and these were the foundation of a flock which now numbers 1200 and is housed and yarded on an acre of ground.

Mrs. Bell's birds are kept in two long houses, each 60 by 18, and divided into four sections, so that each section provides roosting space for 150 hens. These houses are of the open-front type so generally seen in California, and are equipped with cement floors, awnings on pulleys to let in the sun or keep it out, as the case requires, covered mash boxes accessible from both sides, droppings boards that are readily moved for cleaning and nest boxes with hinged tops which may be closed at night to keep stray broodies out. The double-yard system is followed, the hens being kept in one yard while a crop of Sudan grass or barley is grown in the other.

Sudan grass is found to be a very good summer green feed on this ranch. When it is planted in the individual yards it is cut four times for feeding before the chickens are turned in to finish it up. A patch is also kept just for cutting, and this patch, if well watered, yields crop after crop and is ready for cutting, with the right care, a month after planting. If left to itself it often grows as high as an ordinary person's shoulder.

One secret of success, Mrs. Bell believes, lies in constant culling. She does not, however, believe in culling by the color test nor by the late molting test, though she admits the hardest working hens are always the shabbiest looking. "The hens that molt fairly early and get to work again before fall," she declares, "are most valuable to me."

Mrs. Bell's layers have the usual ration for layers—a dry mash accessible at all times, a liberal feeding of mixed grains at night and cut greens at noon. For breakfast the hens usually get sprouted barley, sprouted three days, or just till the roots begin to show.

Once she makes sure that a hen is a good layer, she keeps her three years, but all slackers and laggards and imperfect birds are ruthlessly culled out month by month as she finds reason to doubt their vigor or prolificacy.

"Can a woman make a living at poultry keeping?" I asked Mrs. Bell. Her reply was emphatically affirmative. Not only have her hens made her a comfortable living, in spite of skyhigh feed prices, but they have bought her a little truck in which she does her own hauling. She loves her fowls and enjoys caring for them, and this has no doubt contributed very largely to her success.

Corning House at San Diego

Are we to understand by Mrs. Koethen's article, "No Yard House," published in August 16th number of Cultivator, that the Corning chicken house is not common in your section? As they are so common in this section I naturally presume they are in your section so will not go into much detail.

The upper picture shows exterior of one of mine, 100 feet long, 16 feet wide, 8 feet high in front, 6 feet high in back and built from 18 inches to three feet or over off the ground as contour of ground may require so that floor is level.

The lower shows interior. Dropping boards at right three feet off the floor, roosts hinged at back. At upper right is shown trolley line along which dump box, suspended from two barn door hinges, runs, for purpose of cleaning dropping boards. Feed troughs to left, above floor about 18 inches, and line of birds 'at it." Litter perhaps six inches deep on floor. Muslin curtains hinged and partly down shown in upper picture.

Nests are made "drawer" fashion and slip under dropping board and tight up to it so dropping board forms top to nest. Hens enter nests from back and front door lets down to gather eggs. These do not show as picture was taken before many nests were installed. This house was built in 1913 and has had chickens in it practically ever since, either given outside range or not as convenience might dictate.

Why "units"? Birds have full run of this house. House this size capable of accommodating 800 to 1000 birds. Faces south, windows also open on north side under dropping boards. Of course I know there has been agitation that birds do better in smaller flocks, and I am inclined to try this out as far as brooding is concerned. I have always brooded in large lots from 500 to 1200 odd, using a Buckeye coal stove or fuel oil stoves made in Petaluma.

But I believe if I were to build more laying houses they would all be made on this plan, in general, with possibly some detail changes. I can find you excellent laying records of houses of this kind—in one instance one 160 feet by 16 feet containing 1500 birds never out of the house.—Warren Roberts, San Diego.

* * *

I do not know just why the no-yard house is not in vogue in the section about Los Angeles. Perhaps it is because of a general feeling that in so warm a climate birds need to get into the real outdoors, or maybe it is because the poultry department of the University of California, which most of our poultrymen take as their guiding star, does not favor either this style of house or the keeping of hens in flocks of over 200. Possibly it is just sentiment. I wouldn't like to be shut up all my life; why should a hen like it? Be the reason what it may, outside of a very few men who are trying out the Charles Weeks system, which confines the birds in flocks of not over 25, Mr. Hawes is the only

A Corning Poultry House

Exterior above and interior below, showing a bunch of contented fowls. Description on preceding page.

e I have found using this type of ouse. Perhaps I might add that Mr. awes implored me not to give his ldress because he already had more sitors than he wanted.

Theoretically, the double-yard system is the ideal. Practically it never orks out as you think it is going to. he hens eat up the green crop too pidly, and then they have bare yards gain. As between bare filthy yards id none at all, the balance should rtainly be on the side of none at all. more spic-and-span cleanliness is quired in the no-yard house (at ast it is practiced); on the other hand, one person can care for a considerably larger number of hens when they are confined.

At the University, and I believe at all experiment stations, sentiment is against the large flock. But this proves nothing. The proof of the pudding has never been its recipe. While the hens in the large flock may lay a slightly smaller number of eggs, you can keep more hens with the same amount of labor, or perhaps with less labor. I hope I shall be able to investigate the San Diego system of housing more thoroughly before long.—J. A. K.

Storrs Egg Laying Contest

Storrs, Connecticut, August 29. Report for the forty-third week ending igust 28:

Reports from the egg laying contest Storrs show that in the forty-third eek the hens laid over 200 more eggs an in the preceding week, or a total 3107, as compared with 2995 for the eek before. This is not an unexcted gain; the only thing out of the dinary is that it came a week later an the management expected it ould. The records for the last five ars show that a similar increase in g yield has occured on the average ring the second and third weeks in igust of every year instead of the st week. This yield means then, at throughout the week each 100 ns average to lay nearly 45 eggs day as compared with only about eggs a day for the previous week.

From all previous records it may be fely predicted that this is the last crease in yield, as the production of e flock as a whole will decline from is time on until the end of the const in October. Another interesting ing in this connection is the fact at during the last five years August s without exception, been the month which the total number of eggs ld for the largest amount of money. iere are, of course, other seasons ring which considerably more eggs e laid, as in May and June for inance, and there are of course, times ien eggs sell at a higher price, as November and December; but the st combination has always come in igust.

A pen of White Leghorns entered J. Frank Dubois of East Lynn, assachusetts, won first place for the eek with a yield of 54 eggs.

The three best pens in each of the incipal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francais, 1652; Laurel Poultry Farm, 1619; Ingleside Farm, 1482.

White Wyandottes

W. Bradley, 1422; Curtis L. Allen, 1383; Merrythought Farm, 1255.

Rhode Island Reds

Laurel Hill Farm, 1570; Deer Brook Poultry Farm, 1493; Chas. H. Lane, 1436.

White Leghorns

Hilltop Poultry Yards, 1600; J. Frank Dubois, 1522; Kirkup Bros., 1523.

Miscellaneous

Chickatawbut Farms (White Rocks), 1422; Pequot Poultry Farm (Rhode Island Whites), 1364; Albert T. Lenzen, 1233.

Markets are necessarily placed on Page 362 of this issue.

SCALY LEGS

A bunch of scaly leg fowls add nothing to the attractiveness of the yards and certainly nothing to the profits. Clean it up. It's easy.

If the legs are dipped in kerosene or greased with lard every few days for a week or two the mites will be killed and the scales will gradually peel off. The fowl's legs should not, however, be left long in the kerosene—not more than a few minutes at a time, or the whole skin may become tender and sore on the fowl's legs. By dipping the legs in kerosene first, and then greasing with lard, one can make doubly sure of effective treatment.

Some flocks are allowed to go untreated for a long time, with the result that the legs become chalky where the birds have picked off the scales in their frantic efforts to get relief from the mites. It is downright cruel to permit fowls to suffer in this way.

Today's Dream—Tomorrow's Reality

Electricity offers to the farmer of the present the means of eliminating the monotonous grind from the day's routine.

G-E Motors Save Labor

You can free yourself from the physical exhaustion resulting from farm drudgery if you use G-E motor-driven machinery to milk your cows, separate cream, churn butter, cut feed and ensilage, saw wood, thresh grain, pump water and perform the many other tasks which make up the necessary activities of the working day. The cost for power is less than the wages of one farm hand. Ask your lighting company or our nearest office for full particulars.

The Big Four in the Money at California State Fair

Upper left, exhibit of Yolo County, winner of first prize. The three large bales in front of the exhibit are those of Turkish tobacco which grows remarkably well in that county. Upper right, exhibit of Fresno County, winner of second prize. Remarkable exhibit of fresh fruits, cured fruits, conserves and other fruit exhibits in glasses. San Joaquin County in lower left was the winner of third place; a wonderful exhibit of diversified farming, vegetables and fruit. Fourth prize winner was Kings County, lower right. The little cottage "painted" with milo and other sorghum grains was filled with fruits and neat enough for any housewife to live in.

California Fruits at California State Fair

By A. Layman

YOLO was first, Fresno was second, San Joaquin third, and Kings County, fourth in the big county competition at the state fair. This was in the special county prize contest, the hardest fought for at the state fairs since California put up her claim as the greatest fruit state of the Union, and this is pretty nearly always, at least so far as our own state fair is concerned. The big money in the first prize, $600, is one inducement, but by far the greater is the advertising value of "First Prize County" in California fruits and agricultural products.

As one entered the main agricultural or horticultural building Yolo County's exhibit was at the right. It was a remarkably fine exhibit and before the judges made announcement of their awards you heard often expressed the opinion that the award would rest between Yolo and Fresno. Both exhibits were exceptionally well arranged. Yolo's was in charge, and in fact the entire exhibit had been staged by, Fred Shaffer, secretary of the county chamber of commerce.

Next to Yolo was Calaveras, also in the prize money, its exhibit in charge of H. R. Barden and James B. Luddy. This was largely of minerals, though there were some very fine agricultural exhibits, and these minerals, in fact, account for Calaveras' exhibit being one of the winners.

Humboldt County made a fine showing of pears, apples, potatoes, wool and products of woolen mills. The center of her exhibit was a small model of a church built in cedar from material taken from an old church building erected by the Russians when they occupied the territory of Humboldt County in 1812. This timber which was resawed and used in the construction of this little model of the original church looked as bright and well preserved as if just made from the standing timber. This exhibit was in charge of J. F. Benton, R. L. Warner and V. C. Bower.

Next to Humboldt, and still in the south end of the building, was Alameda. In magnitude and careful selection Alameda hardly came up to some of her former exhibits, but for variety her exhibit was wonderful. In fact, it was split, for besides this one in the horticultural building a large tent was erected near the manufacturers building and in this was the exhibit of the manufacturers of Alameda County. She made most striking exhibit of the cotton mills, the largest of the West. Edwin Stearns was in charge.

Going down the east side, the first exhibit was that of Sacramento County. Sacramento was not in the money, in fact, not in the entries. For, as she has always done, she did the gracious hostess act and while making an exhibit told the others to go to it with their winnings, and she would be simply an onlooker. She had a fine showing of grains, fruits, both fresh and in glass. The most surprising exhibit, perhaps, in this collection was that of grapefruit. Sacramento County has one large grapefruit orchard in particular which claims to have the finest grapefruit grown in the world. The exhibit was in charge of Fred C. Brosius and C. A. Wilkins.

Siskiyou County made a wonderful exhibit of minerals, especially of gold nuggets. These were the genuine article, not gilded paste, and thousands of value was represented by them. They attracted continual crowds. Other minerals and mineral water made up the principal part of this exhibit which was in charge of W. L. Kleaver.

The center of the building under the rotunda was occupied by the war department exhibit of small arms; also by concessions for sweet cider, orange juice and other "fruit" drinks.

One of the most striking exhibits in the building was that of Solano County. Solano's long suit was plums. Possibly there were not hundreds of varieties but there were certainly scores. To be more definite there were exactly 80 varieties of plums in this one exhibit. One of the most striking ones being shown for the first time is the one which has been named the President. It is a new seedling produced by Millard Sharpe on his Vacaville place. There was a large number of other recently produced seedlings which gave an idea of the magnitude of the plum industry and its future importance. Other striking features in the Solano exhibit were specimens of ramie in all stages from the growing plant to the finely finished article as soft as silk. Solano's exhibit was in charge of Charles Wire and Millard Sharpe.

The Fourteen Counties Association, having to do largely with the counties of the Sacramento Valley, left most of the county exhibit work to individual counties. However, it took the opportunity to attract attention to the entire valley and its worth to producers.

The north end of the great building was given up to the state fish and game commission. A great panorama, made effective by various colored lights operated automatically, gave sunrise, noonday and sunset effects and included a view of California's mountains from Whitney to Shasta, with real waterfalls and running brooks alive with rainbow and other trout. These fish were shown in all stages of development from the egg to huskies a foot and a half long.

Going up the west side of the building the California State Exposition Building of Los Angeles was there entire, though in a small model. In fact, the entire exposition grounds were there and attracted attention to this wonderful exhibit place as a means of showing the worth of the agricultural products, the mineral products and all opportunities of the state. This exhibit was in charge of W. H. Fowler and A. Koach.

Los Angeles County was next. Oranges and lemons, apples and ostrich feathers, climate and health were all exhibited. Los Angeles County was proud of its winning on citrus fruits. The exhibit was not large but it was a little gem. It was in charge of Chas. Wilson and Avrian Green.

Tehama County exhibited the Iron Canyon project, or, rather, the Iron Canyon, project which is in Tehama County, exhibited itself and showed the wonderful possibilities from conservation of winter floods. The irrigable area of this proposed Iron Canyon lake was 225,000 acres. H. P. Hatfield, secretary of the Red Bluff chamber of commerce, was in charge.

John D. Maxfield, in charge of the United States forestry service with headquarters in San Francisco, had a most interesting exhibit, interesting because it was in motion. Artificial forests were constructed and causes of forest or mountain fires were shown. One scene was that of a passing train. A spark lights the tinder of a grain field and colored lights and real smoke give a most realistic effect. The machinery takes this view out of sight and presents a mountainside where a stroke of lightning, quite real, starts another fire. And so with the carelessly left camp fire and other fire causes.

Down the center of the building from the south end is Kern County with great exhibits of mineral oils, of milo and other sorghums, and great varieties of fruits in glass containers, in charge of C. F. Johnson and L. D. Culley, the latter being the designer of the exhibit.

Glenn County exhibited under difficulties. Her booth had been designed by an artist in Los Angeles and was ready for delivery when the strike started. Likewise the great exhibit of fruits, grains, especially rice, were in Glenn County, and found it hard to be removed from there, also because of the strike. Trucks were requisitioned and the artistic design was carted from Los Angeles to Sacramento in trucks.

Grapes, raisins, peaches, plums, figs, fresh, likewise cured, canned and preserved, were all exhibited by Fresno

Continued on Page 381.

Two Artistic County Exhibits at California State Fair 1919.

The feature exhibit at the left is that of Glenn County, one of the newer and one of the younger counties of California. It was one of the most artistic in the great horticultural building. Exhibit at right, that of Los Angeles County. While first on citrus fruit, citrus fruits entered but little into the general make up of the feature. The basket of peaches in this exhibit was declared by an expert to be the most perfect in color, form and flavor of any he had seen.

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The cover speaks for itself. The best part of it is that in doing so the Big Four, or the counties which were topnotchers in the winnings at the state fair, are speaking for other counties of the state for their exhibits are but an example of many others made at the same great show.

KILL THE DUCKS

Now comes the fish and game commission and secures the revoking of permits which have been granted to rice growers to kill ducks which are a pest in their fields.

Ducks may be of more value than rice to a few millionaires, but the rice growers and some other producers are asking serious questions as to the value of some of our state organizations which are putting sporting above feeding the world.

EVERYBODY STRIKE!

Now comes the Amalgamated Federation of Railway Mail Clerks and makes an appeal for immediate salary increase of $1,000, effective July 1, 1919, and $500 as a bonus for each of the years '16, '17 and '18. This looks exceedingly attractive, and we suggest that farmers and others appeal to the government for a bonus of $500 for the past three years because of losses incurred, or because of this or that or some other equally good and sufficient reason.

It is simply astounding how we are all getting the idea that our Uncle Sam has one long pocketbook and all of us are entitled to put in our fingers whenever we need additional cash. If we don't get it, of course we can all strike. The policemen are doing it, and now it is stated that the propaganda is being carried into the U. S. army, and soon we may have common desertion under the name of a strike.

THE TRACTOR SHOW

Tractors and their implements are being demonstrated at La Brea field this week. They are in the hands of experts and better work is being done than the average farmer will be able to do. Nevertheless there is an excellent lesson in this demonstration in the hands of experts, and many a farmer will get his first inspiration to do better and bigger farming than in the past. This demonstration may not be one of the biggest ever, but it certainly is one of the best in that tractors and implements are constantly being standardized and brought closer to perfection.

Unfortunately soil conditions at this period of the year are not such that the most attractive show can be made of power farming. The dust which rises from the hundreds of tractors and implements in operation is almost unbearable, but people are dressed and prepared for the job in hand and they are learning power farming—which means profitable farming.

WAR ON THE PRODUCER

The Retail Grocers' Association of San Francisco is endeavoring to divert attention from the abnormal profits of its members and turn it to the producers. It has held a meeting and resolved. In fact, it is charging that the producers are combined in one or several great trusts. This is the way the grocers put it:

"The California Rice Growers' Association has already announced an opening price of six and one-half cents a pound as against 4.32 cents last year. This will mean a retail price of 12 cents a pound to the consumer, the margin of profit to the retail grocer being the same as last year. In addition to this, the California Almond Growers' Exchange and the California Walnut Growers' Association are planning to announce increased prices in a short time. The former will announce tomorrow an opening price of 35 cents a pound as against 25 cents last year. The walnut growers on October 10 will announce an opening price of 35 cents a pound, the price last year being 25½ cents. It can readily be seen just what these increases will mean to the consumer."

Apparently the retailers enjoy passing resolutions. The ostrich is not the only animal which thinks itself perfectly safe once its head is covered in the sand.

STANDARDIZING

An agricultural fair is a place where optimism prevails. Every exhibit is presumed to be made with an idea of expressing: "See what we have done under California soil and climatic conditions with these big pumpkins, perfect grains, luscious fruits and various other products filling every nook and corner of this great agricultural building."

But there was one exhibit at the recent state fair which did not emphasize this optimistic tone. This was a part of the exhibit made by the state department of agriculture. There were crates of grapes, showing when the covers were lifted, great bunches of luscious fruit, but when the upper layer was taken off a vastly different condition was revealed. Grapes in various stages of decay, or so green and sour as to be absolutely uneatable, grapes with masses of honey dew producing mealybugs—the whole showing as far removed from standardized pack as was possible to make it. These grapes were taken from stands or from cars where they had been offered in regular trade. They were horrible examples which would in no way increase a liking for California products. Of course this exhibit was made by the standardization division of the department.

ELIMINATE GAMBLING

The Cultivator has referred in years past to some features of the state fair which were not strictly educational, for instance, the marriage in the lion's den, the selling of quack nostrums, and, years ago, the maintaining of a liquor bar. Nearly all of these objectionable features have been eliminated and we now have an educational agricultural fair.

It is evident that there must be opportunity for play and sport and entertainment for all members of the family, so spectacular events, fireworks, playgrounds, etc., are installed and aid in increasing gate receipts. One of these desirable features is located next to the womans' building. It is a playground which is so popular that it is already too small. There are swings, teeters, slides, sand boxes, practically everything dear to the hearts of the children, and all covered with an attractive tent. It is safely fenced to prevent youngsters from wandering. Yet directly across the drive from it is the zone or pike, or whatever it may be called, with concessions, some of them very objectionable. Most popular of these seemed to be the wheels of fortune. dice throwing, etc., where children are urged to pay "Five Cents for a Dollar Box of Candy"—or a Teddy bear or a kewpie. Many a youngster, seeing the sign promising big reward for small investment, does not appreciate the fact that he is taking chances, and when the dice are cast and he is informed that it is too bad his nickle did not win—and perhaps it was his last—he naturally leaves in tears or filled with resentment. We believe this to be the most fortunate ending of his venture, and he was far "luckier" than the child who wins the prize, that is from the standpoint of his future life. Some of the summer resorts of California have eliminated this form of gambling because of its vicious influence. Among other reforms which our state fair organization is initiating we believe it will be wise to bar these gambling devices.

MILLIONS FOR FAIR

President Roeding of the board of directors of the state fair association, speaking before the recently formed California Exhibitors' Association, urged that an annual state fair be held in Los Angeles in winter and, as heretofore, in Sacramento in the summer or fall. In addition he referred to the movement which has been started to secure a million dollar appropriation for improvement of the state fair grounds.

It seems to be fairly well settled that Sacramento shall remain the state capital and the center around which such activities shall revolve. Hence there should be no more delay than is unavoidable in the matter of fitting the grounds to give best service in the annual fair. At one time it was seriously discussed as to whether a state fair gave sufficient return to justify the expense. That question is settled, but the question now before us is: "Shall we hold two state fairs, one, as has been suggested, in the southern end of the state? The latter in order to give the vast number of tourists an idea as to agricultural possibilities north of Tehachapi; further, to give to the southern end of the state the advantages which come with such an exhibit of California's products. While the opportunity is to be given to Northern California agriculturists to exhibit in the South before winter tourists may be invaluable, yet the opportunity in Sacramento has not been of sufficient value to induce large numbers of southern producers taking their products 500 or 800 miles at a period when weather conditions are very hard on their live stock, fruits and other products.'

But in any case we believe it will be a wise move on the part of the producers to support the present movement for a liberal appropriation to fully equip the grounds at Sacramento.

A LITTLE RAIN

Prune, peach and raisin dryers were given an awful shock in a shower which visited some of the fruit drying sections of the state last week. The shock was given not because of the quantity of the rainfall but because of memories of last year's deluge and fears that this year's shower was but the beginning of a similar event. Fortunately a night and a day sufficed for the clouds and bright sunshine dispelled the fears and drying is going on under California's most glorous sunshine. Millions in gold will soon be coming Californiaward. Meantime, if more extended shower does come, here is a hint by Prof. Cruess:

"Prunes wet by heavy rains may be dried successfully, if they are exposed to the fumes of burning sulphur for two or three hours. This checks molding and fermentation and hastens drying; but action must be taken within five days after the rain has started, if the method is to be effective."

Last year's loss in prunes from rain, estimated to have been $5,000,000 could have been obviated by similar prompt action, acording to Professor Cruess.

Circular 213 of the College of Agriculture of the University of California, describing several types of prune evaporators, may be obtained free upon application to the state university."

BEANS UP

Beans are again back practically to the prices of a year ago. Manager Churchill of the Bean Growers Association anticipates the coming season's crop will sell for around 11 cents. Some new-crop sales have been made at $11.70. The United States over the total output will be little if any more than 50 per cent of last year's: Last year's disaster discouraged large planting, and this past season's shortage of rainfall are responsible for this great decrease. The disastrous slump in prices made possible by the cupidity of two or more officials in the food administration has cost the producers—likewise the consumer—millions.

Orchard Cover Crops

By G. W. Waterbury

COVER crops do two things; open up the top soil and prevent packing and washing by the winter rains (when there are any), and put nitrogen into the soil. Both are important but neglected by too many orchardists.

Cover crops are as necessary for deciduous orchards as for citrus. Nitrogen and humus are needed in all our soils in Southern California, which are strong in potash and fairly well supplied with lime and phosphoric acid. The only problem with the apple grower is how to get the picking of the late varieties through with in time to get a cover crop started before the warmth of the air and the ground disappears.

Summer cover crops planted in the inland districts, where the humidity of the air is very low, have not been a success. Frequent and deep irrigations are necessary in order to replace in the soil what the intensely dry air is removing from the ground through every added piece of vegetation.

Melilotus indica is at present the prime favorite, with Windsor beans, vetch and burr clover still used. What gives promise of soon surpassing all in popularity is the purple vetch, not now on the market but destined in the future for a long life of usefulness.

Purple vetch has been tried at the experiment station and on the Limoneira ranch at Santa Paula and has shown itself a hardy and rapid grower. The best stand I ever saw was a test plot grown by Mr. Culbertson on the Limoneira ranch some time ago.

In order to encourage the planting of purple vetch for seed, Mr. Barnes of the Fruit Growers Supply Company, has this year entered into contracts with seed growers in Oregon that will insure an ample supply to California Fruit Growers Exchange members in 1921. Mr. Barnes has guaranteed the price for this year's seed which is to be replanted by the Oregon seed men next year and the year following.

There are three ways of planting the cover crop in orchards. First sow before furrowing out and the land is then laid by for the winter. Second is to sow before furrowing out and again after the furrows are made but before the water is run in the irrigating ditches. The third way is to wait until after the irrigation, then work the land up and sow for the winter.

The first two ways are now the more popular, supplanting the former way of sowing after the irrigation when the land was laid by for the winter. The amount of seed sown is now from 20 to 30 pounds per acre for melilotus. Where the sowing takes place before and after the furrowing out process the amount is cut in two, half being sown each time. In orchards with wide spaces 30 pounds will bring a surer and thicker stand than 20 and is probably worth the difference in cost. The best time to sow in the inland districts is from the 10th of September to the 15th of October. Clover seed sown when the weather is dry and hot is often burned off at the top of the ground when starting and meets an untimely death. On the other hand cover crop seeds do not start readily in cold weather. They need heat to germinate.

The practice of splitting the monthly run of water without adding anything to the regular amount I have not found of particular advantage. The water remains nearer the surface of the land and perhaps helps the cover crop a little but does not percolate down deep enough into the soil to help the trees. Ideal weather conditions, of course, would favor breaking up the regular run, but the longer we gamble with ideal weather conditions the less we think of the business.

In lemon orchards in some districts a rapid growing, irrepressible thistle seems to thrive, encouraged by the shade of the wide spreading trees and the deeper shade from the sun's rays. Its rapid growth crowds out the slower clovers, and the nitrogen and humus are lost. A sprinkling of barley or rye with the clover is about all that can be done to head off and repress the noble aspirations of the thistle to rapidly possess the land.

Fortunately pickings in the orchards are very light when the clovers are beginning to grow, and thus tramping does not kill off a great proportion of the crop. In most orange orchards there is none at all and all thrifty orchardists have all their pruning done and the brush cut or hauled off before the cover crop goes in.

The apple orchardists are not so fortunate, and where late Winesaps or Rome Beauties are to be harvested the picking will probably be done after the cover crop is in. However if the roots have taken hold it is surprising how soon the stalks will grow after the beneficial fall rains come and favorable growing conditions are at hand.

The best way of sowing is undoubtedly by a small hand sower, which carries enough clover seed for about half an acre. This machine can be regulated to a nicety and if kept well oiled is easy to operate. There are three systems of caring for the seed when sown; one is to harrow as lightly as possible, the second to brush harrow the seed, and the third to leave without harrowing, depending on the irrigating water and the winter rains to wash the seed down into the soil and provide sufficient covering. A good portion of the seed will not be reached by the irrigating water and must wait for the winter rains to start. Fine clover seed will not start well, if at all, if covered with soil to more than slight depth.

Winter Cover Crop in the Citrus Orchard

By Robert W. Hodgson

DURING the last few years citrus growers in general have come to the realization that an adequate supply of readily decayable organic matter added to the soil at periodic intervals is of paramount importance in maintaining the trees in a healthy and thrifty condition. There are about three sources of active organic matter available to citrus growers at the present time, animal manures, bean straw and alfalfa hay, and the green manure or cover crop. The choice of the source which the individual citrus grower makes will depend naturally upon a number of factors. In some citrus sections bean straw and alfalfa are practically unavailable or cost too much to ship in, while in others the cost of transportation is practically nothing. In practically all sections manure has now reached an almost prohibitive price. The cover crop is not satisfactory under certain rather restricted soil conditions and does not amount to much in old orchards where the trees are close together. So that in selecting the source of organic matter the citrus grower has many things to consider. Where the cover crop is possible, however, we have considerable data to show that its use furnishes the cheapest and most efficient method of soil building in our citrus orchards. Its use is especially to be advised in young orchards, and particularly where soil conditions at the time of planting are not especially favorable. It seems possible by the judicious use of cover crops, both winter and summer, to build up the soil in a young orchard at the same time the orchard is being developed.

The emphasis has largely been placed on the winter cover crop on account of the natural rainfall occurring in that season of the year, and accordingly the last eight or ten years have seen the development and rapid spread of the practice of using winter cover crops in our citrus orchards. At one time or another a large number of different crops have been tried, but in the competition sour, or bitter, clover, Melilotus indica, has gradually demonstrated its superiority until at the present time it constitutes the most important winter green manure crop grown in Southern California. Second in importance ranks common vetch, Vicia sativa, closely followed by Canada peas, both of which, however, have serious drawbacks preventing their more extensive use, in that they are readily attacked by aphis and vetch, the latter also serving as a host plant for the cottony mold fungus. For these reasons the use of vetch and Canada peas as green manure crops has been decreasing year by year, although on certain of the more open and porous soils growers still feel that they constitute the only satisfactory winter cover crops on account of the difficulty frequently experienced in such soils in obtaining a satisfactory stand with the smaller seeded melilotus.

What Is Average Green Manure Crop Worth?

Although most citrus growers will readily admit that the addition of organic matter and nitrogen to the soil, such as is accomplished through the use of a green manure crop, is probably a desirable thing, especially if the cover crop be handed properly, oftentimes the question is brought up of just how great is the value received from their use. To answer this question among others, some 12 years ago the citrus experiment station began a series of experiments on the use of cover crops, the results of which are summarized in Bulletin 292 of the agricultural experiment station, by W. M. Mertz, issued only last year. This bulletin constitutes one of the most valuable publications ever put out from the citrus experiment station, and every orchardist would do well to have a copy which may be obtained by writing to Berkeley or Riverside.

In this bulletin Mr. Mertz, who until recently was a member of the citrus experiment station staff, and who had charge of the cover crop experiments for a number of years, shows by actual measurements that at the end of ten years there is a vast difference in the yield and quality of fruit on trees in the plots planted to green manure crops and those where winter cover crops were not grown, although given the same care in other respects. Moreover, there is a marked difference in size of trees and in general health in favor of the legume green manure plots. In fact the trees on the plots where legume green manures have been annually turned under were found to be superior in every way to those similarly fertilized where no leguminous green manure had been used. Green manuring was shown to result in a total yield at the age of ten years of 68 per cent more fruit. In addition there was 63 per cent more of the desirable sizes on such plots than on plots not green manured, showing a big difference in the size of the fruit. The trees on the green manure plots averaged 30 per cent larger. The legume green manure plots showed the most thrifty tree condition of all as evidenced by only three per cent "mottled" leaves during the 1912, 1913 and 1914 seasons as against 13.5 per cent for the trees on plots where legume green manures had not been used.

A series of plots using legume green manures as checked against plots using cereal winter cover crops, and in addition varying amounts of heavy nitrogen containing fertilizers, upon which various indicator crops were grown, showed that the use of an average green manure crop of Melilotus indica is equivalent to the application of between 500 and 600 pounds of nitrate of soda per acre. At present prices this would be adding nitrogen to the value of $30 to $40 per acre. The average increase in yields of the indicator crops following the use of legume green manures was found to be as follows: potatos, 39 per cent; corn, 45 per cent; cabbage, 44 per cent; sugar beets, 43 per cent; sorghum, 25 per cent, and Sudan grass, 18 per cent.

The Value Aside from Addition of Nitrogen

The $30 or $40 worth of nitrogen added to the soil, however, does not represent the total value of the incorporation of legume green manures in the soil. Of very considerable importance is the addition of the organic matter, entirely aside from its high nitrogen content. The necessity of adding organic matter to our soils to replenish that lost through oxidation and other agencies has been urged for years. A text frequently used at

Agricultural News Notes of the Pacific Coast

Northern California

Yolo County raisin growers report a crop of 1500 tons, dried.

Red Bluff will ship this year a total of $1,500,000 worth of fruit.

Rain has delayed the finish of hop picking in Northern California.

Anderson reports men and women there making $6.00 to $8.00 a day picking prunes.

Wine grapes in the Lodi district are bringing $50 a ton loaded on cars in lug boxes.

The University Farm at Davis exhibited 61 animals at the state fair at Sacramento.

Both early and late varieties of potatoes in the Stockton district will total 25,000 acres.

K. Myomura of Auburn was fined $50 last week for violation of the standardization law.

Sutter and Yuba raisin growers have announced prices raised slightly to produce a light profit.

Napa County grape growers still hold their crop and if prices are too low it will be fed to hogs.

The early September rains around Chico killed the red spider and benefitted the prune growers.

The annual fall conference of farm advisors will take place at Berkeley October 20 to 24 inclusive.

Grape growers of Napa County held a meeting about September 1 to discuss the future of their industry.

Shortage of cans on account of railroad strike caused the Yuba City and other canneries to close for a time.

Lodi shipped a carload of cantaloupes September 1, quite an event as that district is now mostly in grapes.

Oak farm center, Tehama County, conducted a house to house membership drive on September 11 in an effort to raise the bureau membership to 100 per cent.

The Libby, McNeil & Libby cannery at Sacramento last week prepared 179,000 cans of pears and peaches for the market, a record run consuming 170 tons of fruit.

Fourteen hundred vacant jobs are listed at the present time in the Sacramento Valley by the state employment bureau. There is a particularly strong demand for farm labor.

Nearly 300,000 sacks of potatoes and onions from the delta district of Sacramento County have been shipped into Sacramento City on river steamers and barges during the past six months.

Installation of equipment for the manufacture of powdered milk is being completed at the Northern California Milk Producers Association's plant in Sacramento and this branch of the plant will be in operation early in September.

A large shipment of dehydrated foods has just been made by the Horst Company of Sacramento to the Czecho-Slovak army in Siberia. It is claimed that the saving in transportation costs over ordinary canned food amounted to $20,000.

Children in attendance at the state fair were given all the ice-cold, pasteurized milk they wanted free of charge. It was "fresh from the farm," F. W. Kiesel having shipped 24 of his pure bred Holstein cows to the fair grounds to provide the youngsters with such a rare treat

Central California

California's rice fields doubled the world's output during the war.

Fresno County had over 200 varieties of deciduous fruits at the State Fair.

Aphids are reported very bad in Stanislaus County on blackeye beans.

Watsonville reports very little shortage of cars and apples are on the move.

Do not forget the San Joaquin County Fair opens at Stockton October 6.

Watsonville will pack 3,000,000 boxes of apples, 500,000 more than last year.

Lodi vineyards report no damage from .06 of an inch rainfall on September 7.

A big revival of interest in pheasants is manifested in several parts of California.

Zinfandel grapes at Fresno brought $65 a ton last week and prices are advancing.

A record price for hogs was established recently at Turlock, the price being $20.50.

Santa Cruz County has been suffering unusually heavy from forest fires this summer.

The melon growers about Watsonville are up in arms about the depredations of thieves.

More than 200 delegates attended the San Joaquin Valley Water Congress at Tulare.

Santa Cruz County reports a great scarcity of game. Tree squirrels are much reduced in number.

Apprehension is felt among growers in Fresno and nearby points over the apparent car shortage.

Of 10,000 farm bureau members who voted on the daylight saving law over 95 per cent were against it.

Patterson, Stanislaus County, cattle breeders have been heavy winners at the State Fair for the third successive year.

Three hundred and eighteen grape cars were asked for at Lodi and but 49 were delivered. The shortage is serious.

Merced County farm bureau is forming a marketing department to handle all products under a pooling system.

W. H. Brown, Canadian poultry expert for the government, says that all Europe is very much in need of poultry of all classes.

The California Poland-China Breeders' Association will meet October 3 at Modesto and later hold a winter sale at Davis.

A carload of wool shipped from Merced and Stanislaus Counties to the East brought 60 cents a pound at Boston recently.

Local organizations of walnut growers have been formed at Arroyo Grande, San Luis Obispo County, and at Chino, San Bernardino County. Both will affiliate with the California Walnut Growers Association.

Ground squirrel poisoning in San Mateo is at its height. Approximately 50,000 acres are involved in the operations. Quoting Commissioner Woodworth, "It has been some slaughter!" He also reports a great deal of damage by the gopher in his county, especially noticeable at this time when the dry peas and beans are on the fields.

Southern California

Honey in the south is bringing close to $300 a ton.

San Diego County fair will be held September 24-27.

Redlands shipped about 4,500 cars of oranges this year.

Redlands district reports a 2000 ton peach crop this year.

Riverside has its first wholesale grocery house in full swing.

Imperial Valley farmers are bidding for government hay contracts.

Fillmore wants a civic center but balks at a bond issue of $5500.

Reports from Ventura County still show a very poor bean crop in all parts.

President Wilson will look over his future home site at Santa Barbara this week.

A Santa Ana fumigator died last week from inhalation of cyanide fumes.

Balboa Park, the site of the San Diego Exposition, will be used for the county fair.

The La Verne Orange Association, recently formed, have already elected a manager.

On September 23 San Luis Obispo County will vote on $1,500,000 good roads bonds.

Phillip's Cling was awarded a $100 prize at Hemet for the best peach in the Hemet section.

The Imperial Irrigation District is short of funds and wishes to issue $2,000,000 in bonds.

A model cannery at Chino is under way, to cost $250,000. It will run throughout the year.

The Southern California potato crop for 1919 will be about 1200 cars, as against 1700 last year.

Orange County farmers must pay the county for the extermination of ground squirrels on their lands.

The Redlands district is turning largely to live stock, which bids fair to rival its orange output.

Twenty-five cars of Emperor grapes will be sent East from Strathmore, packed in redwood sawdust.

As the walnut harvest draws near the crop looks almost one-third larger than the best preceding year.

The Sims Cling peach is a growing favorite in the south and will be heavily planted in Riverside County.

Victorville ranchers are going to grow alfalfa for seed purposes, conditions there proving very favorable.

Bonds of Imperial County to the value of $1,500,000 were not sold at date set for no bids were received.

The August report of the Riverside-San Bernardino Cow Testing Association shows 21 cows giving more than 50 pounds of butter fat.

The highest producing cow for August in the Riverside-San Bernardino Cow Testing Association was Aralia, a registered Holstein belonging to A. R. Stalder.

Grape Day at Escondido was a big success as usual. This was the twelfth annual celebration of Grape Day, which always falls on Admission Day, September 9.

Prof. Bliss P. Brown, the new head of the agricultural department in the Pomona schools, addressed the Pomona Fruit Growers' Exchange last week, urging more cooperation.

The Coast and General

An apple grower near Prosser, Washington, has sold his Banana apples at $3.00 a box, orchard run.

China's rice supply is so short that experts say some of that shipped to the United States will have to be repurchased.

Some cotton experts estimate that nearly a half million dollars damage was done to the cotton crop of the Salt River by a recent storm.

Long staple cotton is coming on earlier this year in the Salt River Valley of Arizona than usual. Several gins began operations the latter part of August.

The Arizona State Fair is offering $20,000 in cash prizes for farm products, livestock, poultry and for the women's division at the 1919 fair to be held in Phoenix, November 3 to 8 inclusive.

A new bulletin by Prof. G. E. P. Smith of the Arizona college of agriculture has just been issued. It is entitled "Use and Waste of Irrigation Water," and the number is 88. Like all bulletins of the Arizona station it is free and may be had by writing State Experiment Station, Tucson, Arizona.

Practically all of the 10,800,000 acres of land given to the state of Arizona under the enabling act has now been selected by the state land commission. The last selection was made the latter part of August and consisted of 90,000 acres in Coconino County. Of the lands owned by the state 400,000 acres have been sold.

The County Highway Board of Maricopa County, Arizona, has arranged for a centrally located material plant for crushing rock to build the $4,000,000 system of roads. This plant will be located on the railroad, and rock, sand and gravel will be delivered within a short distance of the distributing points, effecting a saving, it is estimated, of about $1,000,000.

Land owners in Pinal County, Arizona, are united in a concerted effort to build a storage reservoir on the Gila River at what is known as the San Carlos or Box Canyon site. At a very enthusiastic meeting at Florence August 12, 4000 people met and appointed a committee of citizens to get signatures of land owners who would be benefited by such a project

Light to moderately heavy rains fell over the range section of Arizona during the week ending August 11. Temperatures were higher than during the preceding fortnight and the growth of forage plants has been very satisfactory. Without exception reports show continued improvement both in stock and range with an abundant supply of feed and water for the present and an excellent prospect for feed through the fall and winter.

L. M. Harrison, field agent for Arizona of the bureau of crop estimates, states that the present indications are that the values of the agricultural crops of Arizona, exclusive of live stock, will be $47,000,000 this year, an increase of $5,000,000 over last year

One of the big packing firms is to open a branch poultry and egg house in Phoenix. It is claimed that this will enable them to offer better prices than have hitherto been obtained for poultry products and will result in a stimulus of the poultry industry in the Salt River Valley.

Lemon Pruning Hints

By J. P. Englehart

One of California's best lemon tree pruners, that is, judging from results secured, from trees which he has pruned, is J. P. Englehart of Glendora. Mr. Englehart is one of our pioneers and is not advocating the Englehart system without fullest proof that his own trees which he has pruned for many years are real producers, though he frankly says that there are trees which by no system of pruning can be made to bear satisfactory crops. Some of the methods he follows were given before a meeting of citrus growers in 1913. They have been printed in booklet form and from this we quote fully:

MANY years of experience have taught me to select a young tree with a crown about two and a half feet from the ground. It is a good sign if it has two or three nodes or joints. This indicates that it is not soft wood growing rapidly, neither will it produce sucker growth continuously. Large, straggling, light colored leaves should be avoided. Small dark leaves mark the good bearer.

A tree grown in gravelly soil makes more fibrous roots than one grown in clay soil. The roots of the latter are coarse and when transplanted do not grow rapidly.

A few trees of good type planted on my place two years ago are coming up to my highest expectation. They require not a touch of pruning and possess only the absolutely essential leaf-bearing growth; the rest of the tree is fruit spurs properly placed. At three years such trees pay orchard expenses.

By endless attention to pruning, among other things, the average orchard even may be made to pay expenses in three years unless the original buds were absolutely worthless.

In one grove I am particularly unfortunate in having bought poor young trees of doubtful lineage. Such groves frequently look flourishing and even bear good fruit for two or three years. After that there is continued deterioration in quality. The fourth year I employed a reputable budder to rebud the entire grove to good stock. I cautioned him as to thoroughbred buds, but it proved to be of no avail.

The new wood did not look right.

Again the orchard bore good fruit for three years. Then came the gradual deterioration as before. When confronted with the facts the budder admitted that he had budded from sucker growth. He was still convinced that his buds were all right because everybody, as he said, demanded the showy, rapid growth that is characteristic of the water sprout.

Today I have this grove on hand to be once more rebudded. At this same time I had personally selected buds and done my own budding on 25 trees, and not one has failed to produce fancy summer fruit year after year.

Twenty feet apart is the best distance for Eureka lemon trees. The fibrous roots and rootlets that do the actual work invariably seek the open circle of light and the air away from the tree. This circle is narrow; no rootlets are found near the trunk.

If the tree is higher than 12 feet you shade this circle too much and deprive it of air currents. Besides this, the limited rootlets cannot possibly support a larger bearing surface than 15 feet in dlameter and 11 feet high providing you tax the trees still further by encouraging a low crown.

By bearing surface I mean fancy fruit bearing, as it is a well-known fact that fancy lemons are by far the most profitable to market, even when one allows for the extra care, water and fertilizer required to produce fancy fruit. The quantity of fruit is not nearly as important as the quallty. If I trained my trees higher than 12 feet, I should require them to be 24 feet apart.

The best bearing surface is near the bottom, where the wood is strongest. Therefore, I like a tree 15 feet across.

In my immediate neighborhood the sky-scraper idea for the Eureka lemon has been tried again and again and has been invarlably abandoned. Training the tree to a higher crown, say, from four to five feet from the bottom, has also been tried and abandoned by the writer. At Corona, for instance, one can see fine specimens of the Lisbon variety trained high with large bearing surface. These trees yield their fruit during the winter months mostly, at the time when we compete with the Sicily lemon.

It is my experience that the Eureka lemon tree can with care be made into a profuse and constant bearer, from which a large amount of fruit is picked every month in the year. When the high-crown system was tried it was found that the limbs would come down to the ground after all, and be long and barren. There was also a tendency to upright shoots which carried the sap of the tree where it did not produce the finest lemons.

My method of training and pruning is a decidedly modified form of the open center style. The Baronio style may be the better method near the sea coast. At the Leffingwell ranch in Fullerton the open center style was successfully employed some years ago in remodelling orchards. My method eliminates work by preventing the endless sucker growth invariably obtained by leaving a stub to shape the tree.

I cut to a fruit spur, which throws the new growth or energy into that fruit spur and causes no water-sprouts whatever. This fruit spur thus becomes a leader. If white or foreign wood growth should appear in this leader, cut it off again to a fruit spur, but leave no stub. Thus is produced a zig-zag angular growth of pure wood. Thus the leading branches consist of pure bows or angles of about 30 degrees, which eventually prove to be strong braces against winds, and yet admit sunlight and cause the sap to flow just right to produce fine fruit throughout the tree.

Suckers should invariably be pulled off by hand, whenever they form.

One good pruning once a year is sufficient for the older trees, but watersprouts should be removed several times a year.

All white or foreign wood should be cut out from the young trees especially, and not so very much attention be given to balancing, as nature will attend to that.

Try to get a compact, sturdy tree, with dark, small leaves and dark wood, but admit light and air by keeping the centers rather open.

Too much light is injurious. The finest lemons are produced only when they are grown partly shaded.

Prunes Going to Market

FOR THE first time in the history of the industry California prunes were shipped by express last week by the California Prune and Apricots Growers, Inc., to speed the delivery to markets in the United States clamoring for immediate stocks from the 1919 pack.

The shipment consisted of two cars of Santa Clara prunes of this year's crop which were expressed to New York to supply a market which has been swept clean by the excessive demand of the past few months.

According to a statement made today by H. G. Coykendall, manager of the California Prune and Apricot Growers, Inc., the growers organization which it is estimated markets 75 per cent of the state's crop of dried prunes and apricots, early shipments of this year's pack are much heavier than they have been for several years.

The first prunes were sent East the first week of September and shipments in increasing quantity have been made daily since then. In Coykendall's opinion September shipments will be exceptionally large this year with the growers who are members of the association receiving thousands of dollars for their crop before the end of fall.

Though the farmers were given the scare of their lives by this week's storm which threatened them with losses of hundreds of thousands of dollars to fruit on the trays, reports which have been received by the association from practically every prune section of the state show that very little loss was sustained.

Last year the heaviest rains ever recorded in California for September destroyed two thirds of the prune crop and a repetition of last year's loss this fall would have meant a financial collapse of farmers who as it is have had to make one year's crop pay two year's expenses.

The original estimates of a 275,000,000 pound crop will probably be fulfilled unless adverse weather conditions again damage the crop. Of the total crop the association is counting on packing and marketing from 180,000,000 to 200,000,000 pounds, the largest crop the California farmers have had in the history of the industry.

Six hundred new members were recently added to the California Almond Growers' Exchange in the Red Bluff district.

Heider

No Gears to Strip

IN the Heider Friction Drive a strong fibre rim is mounted on the motor flywheel. The power is taken directly from the flywheel by two big metal discs—one to go ahead the other to reverse. The fibre does the driving and the discs pass the power to the drive wheels or belt pulley.

There is no gear stripping—for there are no transmission gears to strip. The tractor is always "in mesh." It is a resistless pull without jerking or vibration. *Seven speeds, forward and reverse*, are provided, all with one motor speed and one lever, for traction or belt work.

15 to 20% Fewer Parts

The Heider Friction Drive does away with clutch, transmission gears, and bevel gears. In all, it means 15 to 20 per cent less parts.

With fewer parts to run it puts *more* power into the pull. A steady flow of *flexible* power—just as much or as little as you want.

It saves repair expense. It adds years to the life of the tractor. And it is so easy to run that boys and girls are operating Heiders.

For 11 years this tractor has plowed every kind of soil, hauled big loads and furnished the power for all kinds of farm machinery. Its success is merited by 11 years of *performance*. You do not have to take a "demonstration" of one or two days as your guarantee of the Heider.

Two sizes, 12-20 and 9-16. Write for catalog of Heider Tractor and Rock Island Tractor Tools; the famous Rock Island Tractor Plows, 2, 3 or 4 C T X bottoms, and the Rock Island No. 38 one-man Tractor Disc.

Rock Island One-Man Outfits
Heider Model D 9-16 with No. 9 Rock Island C T X two-bottom Power Lift Plow directly attached. Below, Heider Model C 12-20 with Rock Island No. 19 C T X two-three bottom Power Lift Plow. Foot-lever control. Automatic power lift.

Rock Island No. 12 Tractor Plow
Successful behind any tractor. Front furrow wheel lift equipped with 2, 3 or 4 Rock Island C T X bottoms.

A Better Tractor

1919

1899

Every Day for Twenty Years

IT'S twenty years since the first Huber Tractor went to work. Huber Tractors have grown steadily more efficient and more reliable ever since.

12 H. P. on Draw-Bar
25 H. P. on Belt Pulley

THE HUBER Light Four

Draws Three Bottoms
Turns an Acre an Hour

is the descendant of the pioneers of the industry. There has been plenty of time to improve—to correct early weaknesses. And that is why thousands of Huber owners everywhere say the Huber is the tractor that "always keeps going".

The direct spur-gear drive of the Huber by which the transmission system is reduced to the greatest simplicity is a big factor in Huber dependability. There are no bevel gears—nothing but a clutch and spur-gear reduction. Huber high wheels roll easier and afford "more traction grip"; center draft conserves power by avoiding side pull; extra strong materials reduce weight. An exceptionally large portion of the power of the motor is delivered to the draw-bar.

Weight 5,000 pounds; pulls three 14" bottom plows; 12 h. p. delivered to the draw-bar; 25 h. p. at the belt; Waukesha, four-cylinder motor; Perfex Radiator; Hyatt Roller Bearings; burns gasoline, kerosene or distillate; center draft; two speeds, 2½ and 4 miles per hour.

Write for the "Tractor in the Making". It tells the history of tractor development.

WINTER COVER CROP

Continued from Page 377.

farmers' institutes and fruit growers' conventions by Professor G. W. Shaw used to be "With all your getting, get humus." It would have been more nearly correct had he stated "get organic matter", for we are now convinced that it is the active organic matter which is of the greatest value to our soils. Not only does this active organic matter add to our humus content and thus improve the physical condition of the soil, but it acts as a source of food for the bacterial flora and provides optimum conditions for their activity. In addition, it plays the very important part of setting free locked up phosphorus and potassium through its decomposition.

Cover crops of course have additional advantages in the way of preventing of erosion on hillside lands, perforation of plowsoles and compact soil formations and absorption of soluble nitrogen present in the soil in fall preventing its loss through leaching by winter rains.

Handling Winter Cover Crop

In growing a cover crop it is of the utmost importance that a good stand be obtained in order to get the greatest benefit. With the great variation in soils in Southern California it is to be expected that methods used in one section will not necessarily prove satisfactory in others. Indeed, it is in the question of how to handle the soil so as to obtain a good stand that the citrus orchardist is at present most interested. In certain sections the opinion is freely expressed that a winter cover crop is not possible on account of the difficulty in getting a stand. Melilotus has shown a wider adaptation than any of the other cover crops and it is the writer's belief that it can be grown practically everywhere if only growers will experiment trying different methods of seeding and irrigating until the right method is found.

In certain of the rocky, porous soils in the foothill belt growers have complained that it is practically impossible to get a stand with Melilotus, although vetch will do fairy well. The difficulty seems to be that the soil takes water so readily and lateral seepage is so slight that it is impossible to irrigate up a small seeded crop like Melilotus. The usual method of broadcasting the seed followed by a light harrowing does not result in a satisfactory stand except right in the furrows where the water wets the surface soil. The writer has talked with several growers located on such soils who have made a success in getting a stand and they all seem to agree that the seed should be planted deeply, down where it gets to the moisture. This can be accomplished by cultivating it in deeply or by drilling. Excellent results with deep seeding on such soils were obtained last season by a number of farm bureau demonstrations in Los Angeles County. A number of suggestions of value have been made by growers for seeding soils of this open porous character. One is to furrow out and irrigate, followed by broadcasting the seed in the irrigation furrows and on either side as far as the water has "subbed". Then later furrows are run between the original ones, and the process repeated. In this way a fair stand may be obtained even on rocky soils. Another suggestion is in the use of a portable sprinkler system, using a small centrifugal pump mounted on a wagon to be installed on a water box, developing enough pressure to force the desired amount of water through a system of hoses provided with sprinkler nozzles at suitable intervals. This suggestion if worked out would add to our list of specialized citrus operators the cover crop irrigator.

The method which under varying conditions has given the best success with Melilotus has been to broadcast one-half the seed on the dry soil mulch before furrowing. The soil is then dragged lightly with a harrow to cover the seed. After furrowing the other half is broadcasted over the furrowed land and then followed by irrigation.

Time of Planting

In order to obtain a satisfactory growth before cool weather sets in, planting should be done not later than October 15. The sooner in, the better will be the growth made. The writer feels, however, that a cover crop planted late is much better than no cover crop at all as the root growth seems to be made somewhat earlier than the top growth and it bears the nitrogen nodules.

Irrigation

It should be borne in mind that, as with the summer cover crop, sufficient water must be available for both trees and cover crop. Although lack of water in the fall does not cause the fruit to fall to any extent, it does have an effect on the size of the fruit. Competition for water between the trees and the cover crop is not desirable. The cover crop must be given enough water to prevent it from com-

peting with the trees until the winter rains set in.

With the present scarcity of water in many parts of Southern California the water factor will obviously be of even more importance than in normal seasons. Unless a grower knows that he will be in a position to supply enough water for both trees and cover crop he had better dispense with the cover crop this season. There is hardly a doubt but that such a procedure will be necessary in certain districts this season. The grower would do well to bear in mind that a cover crop competing with the trees will do vastly more harm than good.

Amount of Seed

The following table is taken from Mr. Mertz's bulletin:

Crop	Pounds per acre
Melilotus indica and bur clover	20-30
Fenugreek	35-40
Vetches	70-80
Peas	90-100
Windsor beans	100-200
Lentils	60-70

There is considerable discussion regarding the use of purple vetch as a green manure crop during the last year or two. It is true that it has shown many desirable features in the experiments at the citrus experiment station and elsewhere. Purple vetch has produced almost twice the tonnage per acre and has shown more active growth during cool weather. planted late it has given as good results as Melilotus planted early. Further it is reported to be not so subject to aphis as ordinary vetch. The only hindrance to its widespread use lies in the scarcity of seed, practically none being available for use this season. Some concerted action should be under way looking toward securing an adequate supply of seed of this crop for the use of growers.

CALIFORNIA STATE FAIR

Continued from Page 375.

County. It was a wonderful exhibit of the great fruit producing section which claims to be California's center. The big bale of cotton and cotton in various forms gave evidence that Fresno is a cotton producer. The Fresno exhibit was in charge of H. E. Patterson, secretary of the chamber of commerce, and P. M. Rasmussen, director of exhibits and designer of the Fresno fair booth.

San Joaquin County made a fine showing of vegetabes and a great exhibit of deciduous fruits. The exhibit was nearly under tbe great dome of the building and attracted much attention.

The California Almond Growers' Association had a magnificent exhibit of almonds. In fact, the Association secured observation of Almond Day at the state fair. Plate glass in specially designed cases gave a wonderfully rich effect to the exhibit of fine nuts. The association is managed by T. C. Tucker and the exhibit was in charge of A. Kohner.

The little Kings County cottage made of milo and other sorghums and containing and surrounded by a great exhibit of grapes, raisins and all kinds of fruits and grains, was one of the most attractive little exhibits in the building. It was in charge of secretary Rice of the Kings County chamber of commerce. This entire Kings County exhibit had been placed on board cars and shipped part way to Sacramento and at the beginning of the strike was stopped and later turned back and reloaded on trucks. This caused delay in complete installation of the exhibit, but it was a beauty when done.

Placer County, which claims to produce the greatest varieties of deciduous fruits commercially, carried her variety into her exhibit. The fruits were largely arranged on circular tables in commercial pack. About the borders of the exhibit were various legends similar to "Placer County Shipped 4934 Carloads of Fruit in 1918."

The judges of the plate, commercial pack and feature exhibits of this building were Prof. J. C. Whitten of the University of California; Dr. Geo. P. Clements, director of agriculture of the chamber of commerce of Los Angeles, and John J. Fox. One feature of the judging which gave the contest real value was the California state fair score card. This was issued in duplicate, the original copy being given to the exhibitor for his information. The score cards for packed fruits called for 1,000 points perfection. This was divided as follows: Quality, including flavor, juiciness, aroma, texture, ratio of sugar to acid, 150 points; condition, including insect or disease injury, skin punctures, bruises, limb rub, maturity, spray injury, sunburn, stem, and trueness to type, 150; color, 125; size, 75; uniformity in size, color and shape, 150; or a total score on the fruit of 650. Only 50 points were given to the container. These were as follows: Material, 10; marking, 20; solidity, including nailing, etc., 20. The score of the pack totaled 300 points, thus making the 1,000 on fruit, container and pack. These 300 points were divided as follows: Height of center, 100; height of ends, 60; alignment, 20; compactness, 80; attractiveness and style, 40.

J. W. Kavanagh was director of exhibits, though the big new building which housed the above described exhibits was more directly in charge of Fred Howard, formerly horticultural commissioner of Kings County.

One of the largest and most sought exhibits in the building was that in the balcony and placed by the department of agriculture for California under the direction of George H. Hecke. Every division of the state department was represented, but the rodent control and standardization divisions made the most striking exhibits. The balcony spaces were largely occupied by manufacturers and merchants with interesting exhibits.

The large exhibit building formerly used for machinery and pumping displays, was this year given over entirely to educational activities of the central part of the state. Various schools had remarkable exhibits of vocational and other educational features. The University of California occupied three buildings formerly known as Dairy Products Building, the Dairy Barns and another building connecting these two frame structures. The exhibit of autos and auto accessories, as usual, was in the large tents at the left of the main entrance to the grounds. This exhibit was vastly superior to that of last year, but hardly up to the years before the war.

Ask the Avery Owners near you

To Get Greater Crops — Plow Early — and Deep

OWNERS of Avery and other K-W equipped tractors plow at **less cost** because of the efficiency and reliability of K-W Magnetos.

The thing you should look for in a tractor is abundant power, economically generated and applied. Fuel properly carbureted to gas **plus** a hot, intense spark means **power** when efficiently delivered through a well-constructed tractor.

The K-W Magneto gives a spark so hot, that instant and complete combustion and full power is assured from every drop of fuel, regardless of how poor the grade. This added power makes deep plowing in hard ground easy, and because leaner mixtures can be fired without loss of power, greater acreage is plowed **at less fuel cost.**

Nine years of service **on tractors** has proven K-W Reliability in every weather and working condition.

You buy a tractor to get greater crops at lower cost. In choosing your tractor make sure its magneto bears the K-W trade mark. Write for list of K-W equipped tractors and illustrated booklet — "Plow This Additional Acreage Without Fuel Cost."

Correct Tractor Lubrication

(Continued from Last Week)

Heat Losses Though Cooling Medium

All the heat units derived from the explosive mixture are not utilized in work. The loss through the cooling medium of the average internal combustion engine is approximately from 30 to 40 per cent of the total fuel efficiency. This great loss of heat can be avoided. It is therefore imperative that some method be provided to dissipate this heat and keep the temperature of the engine at the point of safety and efficiency.

If no cooling medium were provided the heat of a continued series of explosions, each of which is over 2000 degrees Fahrenheit, would soon heat the metal parts of the engine to a point where they would seize and render the operation of the engine impossible.

It is very important that the engine should not get too hot, and, on the other hand it is equally important that the cylinder should not be robbed of too much heat. The object of the cooling medium is to keep the temperature of the cylinders below the danger point, but at the same time keep it as hot as possible to secure the maximum power.

There are two sources of heat, one from fuel, the other from friction.

The question of lubricating oil is directly connected with that of cooling, but it is not intended that the lubricating oil shall take the place or perform the duties of the cooling medium.

Cooling

Lubricating oil dissipates the heat of friction generated by the pistons in the cylinders. If the cooling medium fails in its function, the temperature of the cylinders will reach a point where lubricating oil will not keep the surfaces of the pistons and cylinders apart and prevent seizing. If the lubricating oil does not perform its duty correctly the heat of friction is added to that of the fuel, and the cooling medium will not be sufficient to keep the temperature of the motor at the point of efficiency.

Not less than seven per cent of the power developed in the cylinders is absorbed to overcome the friction of the piston, and it is, therefore, necessary that the cooling medium be kept at its highest point of efficiency to enable the lubricating oil to perform its duty.

In water-cooled engines, such as are generally used on tractors, the cylinders are surrounded by water jackets in which a circulation is maintained, either by means of a pump, or in the Thermo-syphon system, by means of the difference in temperature of the water in the jackets and radiator.

Reasons for Overheating

Overheating in tractor motors, practically all of which employ water as the cooling medium, is due to one or more of the following causes:

Inefficient Cooling Medium—Some cooling systems are so closely proportioned that the stoppage of the fan, or sediment in the water jackets or radiator will cause the engine to overheat and the water in the radiator to boil.

Examine the Hose: Care should be taken to see that the hose used for radiator connections has not rotted and small particles of rubber deposited in the cooling system, also that the formation of scale and sediment in the water jackets is not so serious as to impair radiation.

Anti-Freezing Solution: Where anti-freezing solutions are used, in which calcium chloride forms a part of the solution, it causes a deposit to form in the radiator and water jackets which will reduce the heat conductivity of the metals exposed to the air. In this case, the temperature of the water will not be sufficiently lowered while passing through the radiator, to take care of the engine, and continued running will overheat the engine, causing the water to boil.

Cleaning Cooling System: A very effective method of removing the above deposit, sediment and particles of foreign matter from the cooling system is to fill the radiator with boiling water in which from five to seven pounds of sal soda have been dissolved. Allow this solution to stand in the radiator and water jackets for 24 hours, after which it should be drained off and the system thoroughly flushed out with clean water If this is done once a month, it will keep the radiator and water jackets in very efficient condition.

Fan: The fan should always be kept in an efficient condition, care being taken to see that the belt is not slipping and that the blades have not straightened out, as in this case the fan will not draw sufficient air through the radiator to insure proper cooling.

Incorrect Mixture—Incorrect mixture causes more engine overheating than all other causes combined. A rich mixture is a slow burning rather than an explosive one. The heat units vary directly with the proportion of air and fuel taken into the cylinder, and if more fuel is taken in than will form the correct mixture, more heat will be generated than the cooling medium will take care of, which will not only show a loss of power, but will very quickly overheat the engine.

Faulty Ignition or Running with a Retarded Spark—One of the common causes of overheating is due to ignition. A late spark overheats the engine; the charge is ignited after the piston has started downward on the power stroke, consequently the hot gases are not expelled from the cylinder before the second charge is fired. This will continue until the cylinders become so hot that pre-ignition will take place, that is, the gas will ignite before the piston has reached the correct point, resulting in what is known as a "spark knock."

By advancing the spark lever on quadrant, the mixture is ignited before the piston has reached top center so that when the piston does reach the center and starts down, the gases commence to expand at the right moment thereby giving impetus to the piston and forcing the crankshaft around. By the time the piston reaches bottom center the gases are at a comparatively low temperature and are exhausted at the next upward (or exhaust) stroke of the piston.

Always operate your tractor with the spark advanced as far as possible, taking care not to advance it so far that the motor will "knock."

Missing: Missing of one or more cylinders has a tendency to overheat the motor, as the fresh gas is taken into the missing cylinder and ignited by the outgoing charge from the working cylinder, which causes muffler explosions and back pressure on the cylinders which are working.

Incorrect Valve Timing—Overheating from this cause is not common unless the valve setting has been changed after the tractor has left the factory. The flywheel is marked at the factory, and there should be no reason for heating from this source. If too much clearance is allowed between push rod and valve stem, the exhaust valve will not have sufficient opening, and this will cause heating.

Throttled Exhaust and Partially Clogged Muffler—When these conditions exist, considerable back pressure is offered to the exhaust gases with the result that the cylinder is not properly scavenged, and heating will result.

Defective Piston Rings—Broken or defective piston rings or leaky piston rings which will lower the compression will also cause overheating.

Badly Carbonized Engine—A badly carbonized engine will not only cause overheating but pre-ignition with its resultant evil effects.

Dirty Oil—If the body of the oil in the system becomes impoverished through long use and impregnated with particles of metal, carbon and dirt, it will produce a high coefficient of friction, and overheating will result; hence the importance of regularly draining and cleaning of the crankcase and oil reservoir.

Oil of Incorrect Body—If an oil of incorrect body is used, it will cause overheating. Incorrect body means that when the oil comes in contact

with the hot cylinder walls its body will partially or wholly break down and allow the metals to come in contact, resulting in an excessively high coefficient of friction overheating and possible abrasion. Incorrect body also means that if too heavy an oil is used it will not reach the wearing surfaces fast enough, and excessive friction will result, which will overheat the engine in addition to causing undue wear.

Correct Oil Correctly Used

By correct lubrication we mean not only the choice of the correct oil (for the very best oil will not give satisfaction if incorrectly used), but the correct use of the same, upon which maximum efficiency depends.

The average person, if called upon to define correct lubrication, would in most cases define it on a basis of brand of oil and stop there. It is very essential that a high quality brand of oil of the correct grade, suited to the motor, be used. It is equally as important that this oil be correctly used, just as correct operation is necessary in order to secure efficient results from the tractor.

The tractor manufacturer builds an efficient power plant which is designed to do a certain work and do this work economically. This power plant will do all the manufacturer claims for it, only if it is carefully and intelligently operated. To insure this the tractor manufacturer issues educational literature on the care and operation of the tractor. He also maintains an expensive service department, the object of which is to educate operators of his tractors to operate the tractors in such a way that they will get the maximum efficiency out of their machines.

One, if not the most important factor in the lubricating care of the tractor is the draining of the oil from the crankcase at regular intervals and the cleaning of both crankcase and oiling system.

The object of all power plant machinery is to develop the limit of power with the least amount of fuel and the least possible cost for adjustment and repairs. To make this possible from a lubricating standpoint the motor must not only have an efficient lubricating system, but the oil in the system must always be in a clean and efficient condition. The lubricating oil in the crankcase must be changed frequently, for several reasons. First, because lubricating oil wears out in use. In other words, it loses its lubricating value after it has been in the system for a certain length of time. Secondly, fuel which condenses in the cylinder works by the piston rings, thins down the oil and destroys its lubricating value. Thirdly, the oil becomes contaminated with the foreign matter, such as carbon, which forms on the under side of the piston; silica or dust, which enters the crankcase through the breather pipe; and oxide of iron, which comes from the wear of the bearing surfaces of the motor.

The presence of this foreign matter in the lubricating oil acts as an abrasive rather than a lubricant. Lubricating oil is intended to form a film between all moving parts such as bearings, pistons, rings and cylinders, taking the wear instead of the metallic bearing surfaces themselves. It is, therefore, cheaper from every standpoint to wear out lubricating oil than metal, and if a motor is expected to develop its maximum power and show a low fractional resistance in the bearing surfaces, the lubricant must be kept clean and it must have its maximum value.

The question of how often the lubricating oil should be changed can not be absolutely determined from a standpoint of mileage or number of hours running. It depends very largely upon the conditions under which the tractor is operated. In other words, if there is little or practically no condensation of the fuel, the oil will consequently last a great deal longer. And if the oil is fed to the motor in such a way that a minimum amount is thrown upon the inside of the piston, there will be a minimum carbon deposit formed there, which means that the oil will run for a longer time without its lubricating value being impaired.

The operator of every tractor should frequently examine the condition of the lubricating oil in the crankcase, and when there is evidence of fuel or foreign matter in the lubricating oil, it should be drained out of the crankcase. The crankcase should be washed out very carefully with kerosene and especial care taken that no kerosene is left in the crankcase when the fresh supply of oil is put in. This should be done, whether the tractor is operated 10, 30 or 100 hours. Generally speaking, where a tractor has operated under favorable conditions, the oil should be changed every 30 or 40 hours. Where kerosene is used as a fuel, the lubricating oil should be changed daily, as there is considerably more condensation in the cylinders with kerosene than with distillate or gasoline, and it is extremely difficult to keep the kerosene out of the crank case.

It is a well-known fact among engineers and manufacturers of tractors, that the operator who is particular in the care of the lubricating system and the oil very largely increases the economical operation of his tractor, and there is nothing in the operation of a tractor which will contribute so largely in net returns as lubricating care.

WANT FARMERS TO BE FIRST TO CUT

David F. Houston, secretary of agriculture, does not assent to the theory that the prices of farm products should fall before the prices of manufactured commodities fall. He makes this clear in replying to a recent communication in which it was stated that "There must be a drop in prices before there is a drop in wages, and it would seem that the farmer is the man who is going to be first hit."

This theory has been advanced by a number of manufacturers, said the secretary, who continued: "It is clearly an unjust contention. It manifestly would not do to ask the farmers to produce, buying everything that they have to buy from manufacturers at high prices, with the assurance to them that their products will fall in price, and that then manufacturers will consider what they will do with reference to their own prices. Obviously, manufacturers must be willing to make at least a contemporaneous decrease in their prices. It might even be contended that they should make a prior decrease in their prices, since the farmer's operations involve a year and he could not recoup for 12 months, or could not recoup at all, because, on the theory put forth, his products would fall in price. It seems to me that business men must be brought to realize that if we are to get back to the normal, they must set about immediately to do their part, and unquestionably, profiteering in manufactured products must be eliminated."

DEALERS BUYING WHEAT FROM PRODUCERS MUST BE LICENSED

At a recent meeting of the directors of the United States Grain Corporation, at New York City, it was determined to define a little more clearly, what constitutes a retail transaction in the purchase of wheat.

Under the license requirements, retailers are not required to have licenses, but it is now determined that the purchase of wheat direct from the farmer for the purpose of resale, or manufacture, no matter how small the quantity, is not a retail transaction, and that persons engaged in such operations must have licenses. Also, the handling of seed wheat, no matter how small the quantity, cannot be considered a retail transaction, and such dealers must hold license. Dealers in damaged wheat, unfit for human consumption, who may purchase such damaged wheat direct from the farmer must have a license.

Retail dealers who purchase wheat entirely from licensed operators are not required to have license.

THE BEAN CROP OF LOWER CALIFORNIA

United States Consul Sydney Smith, Ensenada, reported under date of July 7:

"The commercial bean crop for export purposes in the northern section of Lower California consists principally of the Lady Washington white beans. Approximately 2000 acres have been planted to this crop this year, being about a 40 per cent reduction from the acreage for the year 1918. The reduction of acreage is due to the export duties and other restrictions imposed by the Mexican governmnet, which have made the raising of this crop unprofitable. This kind of beans is not consumed by the Mexican people and there is no market locally. The present price of beans in California is barely sufficient to pay the export duties here and deliver them to the warehouses at California points.

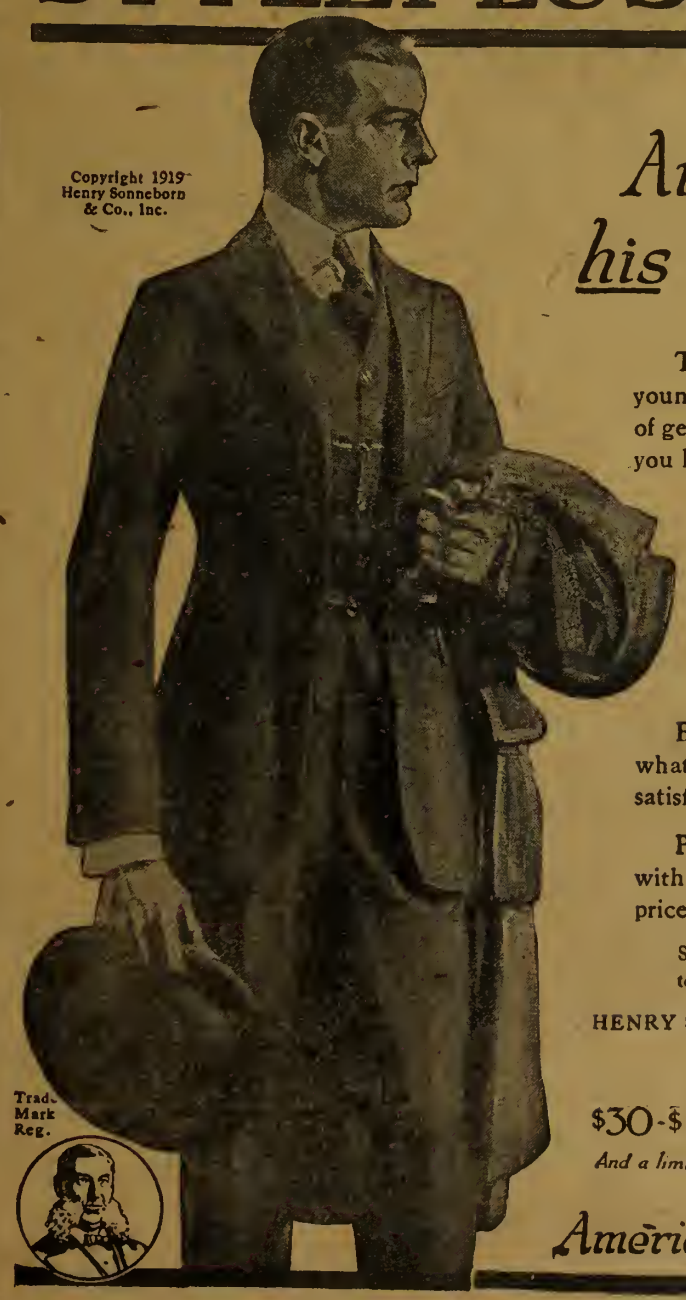
"The yield per acre for the 1919 crop promises to be very light—about two sacks of 110 pounds each to the acre. This is about 50 per cent of the average yield for last year.

"There are about 30 tons of last year's crop in the warehouses at Ensenada at the present time and no possible sale for them. The present crop will not exceed 150 tons, as against 300 tons last year. This entire crop will undoubtedly lie in storage for lack of a market. All beans raised in exportable quantities in this locality are produced by American citizens."

Grape picking time has brought great numbers of workers to the vineyards. Among them are several hundred Indians who come each year to work in the raisin grapes. For these excellent community quarters have been erected near Clovis, consisting of good tents, a six-room building, shower baths and other comforts.

Lodi took first prize on Tokay grapes at the State Fair.

STYLEPLUS CLOTHES



Copyright 1919 Henry Sonneborn & Co., Inc.

Any man can find his style in Styleplus

Tall or short, stout or thin, young or just a bit less young, you can walk into the Styleplus Store certain of getting *your style*. The fabric you like. The model you like. The fit you like.. *And*, the price you like!

All-wool fabrics. Style correct down to the last refinement. Thorough workmanship. Dependable wear.

Our known price policy insures exceptional value. The sleeve ticket put on by us tells the price.

Buy your clothes in a *store*. You can select exactly what you want. You can try on the suit. You are satisfied *before* you pay your money.

Pick out your Styleplus Clothes for fall *now!* Buy with this in mind: Conditions are forcing clothing prices steadily upward.

Sold by one leading clothing-merchant in most cities and towns. Write us (Dept. AB) for name of local dealer.

THE POLAND-CHINA FUTURITY

The Poland-China futurity judged at the state fair this year, was, according to a number of breeders present, not only the largest in number of animals shown but showed a decided improvement in quality. The classes shown were junior yearling boar, junior yearling sow, senior boar pig and senior sow, junior boar pig and sow and litter. The State Poland-China Breeders' Association offered a silver cup for the breeder winning the largest number of points, a point representing a dollar in prize money. J. F. Lehman was the winner of the cup. Following are the awards:

Junior yearling boar—1, W. A. Young; 2, McCarty & Starkweather; 3, M. Bassett; 4, J. F. Lehman; 5, W. A. Young; 6, J. W. Wakefield.

Junior yearling sow—1, W. A. Young; 2, W. A. Young; 3, McCarty & Starkweather; 4, W. T. Dice; 5, McCarty & Starkweather.

Senior boar pig—1, Fred Gatewood; 2, M. Bassett; 3, Geo. V. Beckman & Sons; 4, Hale I. Marsh; 5, McCarty and Starkweather; 6, McCarty & Starkweather.

Senior sow pig—1, McCarty & Starkweather; 2, McCarty & Starkweather; 3, M. Bassett; 4, Fred D. Ross; 5, McCarty & Starkweather; 6. M. Bassett.

Junior boar pig—1, J. F. Lehman; 2, J. F. Lehman; 3, J. F. Lehman; 4, A. L. Bassett; 5, W. A. Young; 6, J. F. Lehman; 7, McCarty & Starkweather; 8, A. L. Bassett.

Junior sow pig—1, J. F. Lehman; 2, J. F. Lehman; 3, W. A. Young; 4, A. L. Bassett; 5, A. L. Bassett; 6, Chas. Gatewood; 7, Geo. V. Beckman & Sons; 8, McCarty & Starkweather.

Litter—1, J. F. Lehman; 2, J. F. Lehman; 3, W. A. Young; 4, A. L. Bassett; 5, A. L. Bassett; 6, Chas. Gatewood; 7, Geo. V. Beckman & Sons; 8, McCarty & Starkweather.

THE DUROC-JERSEY FUTURITY

The Duroc-Jersey breeders made a strong show in the futurity classes at the state fair this year, J. E. Thorp capturing premier honors on the get of Freddy You'll Do. It was reported that the futurity next year would have a larger classification. This year only junior boar and son pigs and litters were shown.

The awards were as follows:

Grand Champions at State Fair. Photos by McCurry.

Upper:—Giant Bob, grand champion Poland-China boar, 1919 California State Fair, owned by Chas. Gatewood, Fresno. 2. Sensation Wonder 1st, grand champion Duroc Jersey boar, owned by H. P. Big Mary 3d, grand champion Poland-China sow, owned by McCarty & Starkweather, Modesto.

Junior boar pig—1, J. E. Thorp; 2, W. J. Fulgham & Sons; 3, J. E. Thorp; 4, Greenwood Farm; 5, Greenwood Farm; 6, J. E. Thorp; 7, W. J. Fulgham & Sons; 8, W. V. Bennett.

Junior sow pig—1, J. E. Thorp; 2, J. E. Thorp; 3, W. J. Fulgham & Sons; 4, J. E. Thorp; 5, W. V. Bennett; 6, W. J. Fulgham & Sons; 7, J. E. Thorp; 8, W. V. Bennett.

Litter—1, J. E. Thorp; 2, J. E. Thorp; 3, W. J. Fulgham & Sons; 4, W. V. Bennett; 5, H. P. Slocum & Son; 6, E. J. Weldon; 7, H. M. Berglund; 8, E. J. Weldon.

HUGH NISBET DISPERSES HERDS

One of the choicest western herds of registered Holsteins will go under the auctioneer's hammer on Monday, October 6, at the Jefferson County Fair Grounds, Port Townsend, Washington, when Hugh Nisbet, owner of Netherhall Farm, Chimacum Washington will disperse his entire herd. From a small number of very select females, mated with outstanding bulls, Mr. Nisbet has developed an unusually fine herd. His herd sire Segis Pontiac De Kol Burke 2d, is by the famous Morris bull Segis Pontiac De Kol Burke, whose daughters are making such wonderful records as heifers, and out of Miss Dutch a 30 pound cow that made 1025 pounds butter in one year, she in turn out of Miss Blaney with 1008 pounds butter in one year. The three nearest dams of Segis Pontiac De Kol Burke 2d are all 1000 pound cows with an average of 1039.5 pounds butter in one year. He will be included in the sale along with 20 of his daughters out of good dams. These heifers are rated among the top show stuff of the Northwest and could very well be added to the highest class herd on the Coast. There will also be daughters of and heifers bred to Sir Chimacum Wayne De Kol Paul, who is by Sir Chimacum Wayne, son of the famous daughter of Sir Veeman Hengerveld, Chimacum Wayne Boon, 1067.48 pounds butter in one year. His dam is Sena J 2d Paul De Kol, 1016.23 pounds butter in one year.

Mr. Nisbet will also disperse his choice herd of 25 registered Berkshires that is of a quality in keeping with the Holstein herd. The great boar Birch Baron will go, also the noted sow Princess Beauty 17th and many of her daughters, and many other choice individuals of the breed strongly bred in the blood of Laurel Champion and Masterpiece.

Will Make a Complete Dispersal Sale

50 Registered Holsteins——25 Registered Berkshires

Monday, October 6, 1919, Jefferson County Fair Grounds Port Townsend, Washington

The Holsteins

These cattle are mostly young and include TWENTY DAUGHTERS OF SEGIS PONTIAC DE KOL BURKE 2ND, whose three nearest dams average 1095.5 lbs. butter in one year. Some of these are from 23 lb. 3 year olds, and nearly all are from select A. R. O. dams. Among them are some of the best show heifers in the Northwest.

The females also include daughters of and heifers bred to SIR CHIMACUM WAYNE DE KOL PAUL, whose three nearest dams average over 1000 lbs. butter in one year, and

Granddaughters of Margie Newman
Granddaughters of King Korndyke Sadie Vale

This is one of the most profitable herds of well bred, high class herds in this famous Holstein valley.

The Herd Is Under Test State and Free From Tuberculosis

SEGIS PONTIAC DE KOL BURKE 2ND will be sold. He is a high class individual, and his breeding ranks him among the leading young sires of the breed. He is by Segis Pontiac De Kol Burke, son of the former world's record cow Riverside Sadie De Kol Burke, whose daughters hold the California records for butter production in one year in both the junior and senior two year old classes, one of them being the dam of the bull that sold for $11,000 at Philadelphia, while he himself sired the heifer that sold for $11,200 in the same sale. The dam of SEGIS PONTIAC DE KOL BURKE 2ND is Miss Dutch, with over 30 lbs. butter in 7 days and over 1000 lbs. in one year, she out of Miss Blaney, 1008 lbs. butter in one year.

The Berkshires

are of the very best breeding, including Birch Baron 247923, a boar of great scale and show type. The herd is rich in Laurel Champion and Masterpiece breeding, among the females being such sows as Princess Beauty 2nd and many of her daughters.

A Real Herd of Quality Berkshires

"STAR LEADER"

holds the commanding position of Premier Berkshire sire. This answers the question as to why his get are in such demand everywhere. To meet the demand for daughters of Star Leader bred, we purchased for $1,000

Natomas Baron Duke

the grand champion boar at the state fair. He was sired by the national grand champion of 1917, Baron Duke 201st.

NATOMAS BARON DUKE is one of those long, deep, smooth boars, so universally admired, with a large, deep set ham, four good feet and plenty of bone to carry his weight. Judge Wyman M. Lovejoy, a national authority on swine, said of him, "As he stands today he is a wonderful boar and bids fair to mature into one of the greatest boars the breed has produced."

And yet another great boar was recently added,

Champion Value 10th

by Duke's Champion 12th, from the Barker herd.

With three such outstanding sires, with as good a herd of sows as can be found, ANCHORAGE FARM is in a better position than ever to maintain its position as a breeder of profitable Berkshires.

We can offer bred sows and gilts and pigs of both sexes.

Anchorage Farm is always pleased to answer all inquiries in full. Anchorage Farm guarantee goes with every animal sold.

Sheep on the Ranch

By A. L. Dahl

IN THE days of our grandfathers sheep were found on every farm but in our generation we have come to look upon sheep raising as a specialized industry suitable only for the wide prairies and high mountains. Until the stimulated demand for wool and meat brought on by the war, the raising of sheep in the United States gradually declined, but in 1917 there was a slight increase over the previous year, and this increase is still continuing as the returns from wool are so large that many farmers have started small flocks on their land and the large sheep ranchers have increased their flocks as much as possible.

There is no reason why every farm or ranch of sufficient size to have pasturage should not maintain a band of sheep for they will prove a good investment. Sheep require little attention; they utilize food otherwise wasted and they are very destructive of weeds and other pests. In England, where sheep growing is almost universally practiced, more than 30,000,000 sheep are annually raised on an area less than four-fifths the size of California, and most of these are grazed on arable lands. In California, where unusually good open ranges are found and where climatic conditions are favorable, less than 2,000,000 sheep are grazed, practically all of these finding forage in the high mountains.

Sheep may be kept very economically as they graze over the fields most of the year, and when feeding becomes necessary hay is the chief diet. They yield two crops a year, wool and mutton, and in keeping down weeds in fence corners, along roadsides, irrigating ditches or on summer fallow, have a high economic value. A flock of sheep may be started with little capital, and where there are young boys in the family the presentation of a few head will often start their interest and develop their managing ability.

The wool clip will in a large measure pay for the cost of keeping the ewe. Average farm sheep shear about eight pounds of wool annually, which under pre-war conditions sold for about 25 cents a pound. Before the war early spring lambs would bring about $5 each. Even though the wool would not pay entirely for the keep of the ewe the profit on the lambs would still leave a good margin. As twins are commonly born the increase in lambs should be over 100 per cent. At present war prices for wool, and with large increases in the price of lambs for food, the profits in sheep raising are big.

Due to abnormally high prices for wool the big sheep raisers of the West have during recent years devoted their entire attention to fleece growing, selling only such animals for meat as were found to be poor wool providers. This tendency has been the main cause for increasing the number of sheep in 1917 as in previous years the decrease had been steadily growing.

Students of world wool trade conditions are convinced that future wool supplies must come from farm flocks, as in spite of increasing demands the commercial flocks of the world are not being maintained. At present the bulk of the world's wool supply comes from sheep kept on the agricultural frontiers. In California little housing of any sort is needed, but where winters are longer and more severe some protection from storms is required. Sheep buildings should be dry, well ventilated and free from drafts, but no special provisions for warmth are required.

Lambs kept for breeding stock should be weaned when from four to five months of age. The lambs intended for market, on the other hand, should attain marketable weights before they are five months of age and should be weaned at the time they are sold.

Lambs at weaning time should be kept for four or five days on the old pasture, as they do not fret as much as in a strange place. The ewes should be removed to another pasture as far away as possible from the lambs. If the feed on this pasture is a little scant, so much the better, for this will help check the milk flow. The ewes and lambs should not be turned in together again, for a large amount of milk from a ewe that has not been sucked for two or three days is liable to cause digestive disturbances in the lamb.

At weaning time the ability of a ewe to produce a good lamb is often ruined because the necessary care is not taken to see that she is dried off properly. A little care at this time will be well repaid. Two or three days after the separation the ewes should be milked out. All of the milk need not be drawn from the udder, but enough should be taken to leave the udder soft and pliable. Mark with colored chalk ewes needing no further attention. In about three days the ewes should be milked out again and the drys marked. Further attention should be given four or five days later to those not dry. No effort should be spared to maintain every breeding animal in a sound and useful condition.

The greatest freedom should be allowed sheep in ranging consistent with protecting growing fields or gardens. Sheep are very fond of certain kinds of weeds not touched by cattle or horses, and if allowed to range freely in out of the way corners of the farm or ranch the sheep will consume a large quantity of weeds and waste vegetation, thus turning them into mutton and at the same time destroying bugs, insects and the seeds of noxious weeds that would otherwise scatter to growing fields. Entomologists claim that even if sheep return no direct profit on a farm their presence there is justified by reason of their function in destroying weeds and keeping down insects.

Some interesting experiments were conducted by the United States department of agriculture at the bureau of animal industry's Morgan Horse Farm at Middlebury, Vermont, to determine the cost of raising sheep on a farm. The experimental flock consisted of 51 ewes and two rams, and accurate records were kept of the cost of feeding, rate of growth, etc. At the end of a year it was found that an average of $10.47 per ewe was the gross income, and after charging off all feed costs at market prices there remained a net profit of $1.60 per ewe, and this did not take into consideration the enhanced value of wool. Of the 51 ewes bred, 49 dropped lambs, some giving twins. The wool obtained from the 51 ewes and two rams sheared 325.5 pounds and sold for 38 cents a pound. The government experts reported that in addition to the actual profit derived from each sheep, their economic value was great because of their proclivity to devour weeds and the quantity of manure which they dropped.

California, with its open climate, its wide expanses of unused lands, and the nearby markets afforded for wool and mutton, provides unusual opportunities for sheep raising on ranch or farm, and the industry should be developed in the Golden State.

THE SHEEP SHOW

By W. S. Guilford

The sheep show at the 1919 state fair was a quality show but in numbers it did not adequately represent the industry in the state. Breeders of registered sheep should see to it that many more flocks are represented in 1920. Some remarkably fine sheep, however, were shown.

There are no better Rambouillets anywhere than those of Bullard Bros. This firm won all prizes on this breed.

Ellenwood & Ramsey of Red Bluff showed Corriedales—one ram recently imported from Australia—where this breed originated. Corriedales show splendid mutton and wool making capacity and sell for long prices.

In the Hampshire classes three flocks were represented: Calla Grove Farm, Manteca; Harvey S. Van Lear, Lodi; and the Spencer Ranch Company, Cranmore. This breed is very popular in California and all over the West, and there is room for many more registered flocks of them. The Spencer Ranch Company showed two rams imported from England and

When Writing Advertisers, Mention The Cultivator

bought by Mr. Spencer at the Salt Lake sheep sale recently. One of these rams is reported to have cost $1000. Spencer has grand champion ram, Calla Grove, grand champion ewe. Calla Grove had grand champion wether of the show on a grade Hampshire.

I. A. Burrows of Newvilie showed Cotswolds without competition; and the Spencer Ranch Co. showed Romneys.

There was considerable interest in the show of cross-bred sheep made by I. A. Burrows and the Spencer Ranch Company. The former has Merino-Cotswoid; the latter Merino-Romney crosses. Both produce splendid big heavily wooled sheep that are very popular. These sheep are bred aiong similar lines to the Corriedales and are much the same kind of sheep.

Sheep men will demand from the next legislature the million dollar appropriation for new buildings and equipment for the state fair.

"The sheep industry in California is valued at a great many millions of dollars," said Prof. R. F. Miller of Texas, who judged the sheep to the entire satisfaction of all. "You need iots more buildings and a much bigger state fair show."

The California state fair is a big institution and none have a keener realization of this than the newspapermen who report the different parts of the show. Every year the fair is bigger and every year it is better. It is not so many years ago that one man could pretty well "cover" the greater part of the fair, the beef and dairy cattle, horses, hogs and sheep, but now it keeps a person busy with one or two breeds of hogs or with any one or two of the other features of the show. All of which brings up the ever present question of housing, grounds and equipment, all of which is woefully inadequate. The million dollars being asked for by the farmres and stockmen for state fair improvements must be provided.

THE DRAFT HORSES AT STATE FAIR

The show of draft horses was a pleasant surprise. Not only were more horses on the grounds than for a number of years but the quality showed a decided improvement. Professor E. A. Trowbridge of Columbia, Missouri, one of the best known judges in the United States, tied the classes in each breed.

The Shires

Easton and Ward had out a very strong exhibit of Shires and swept the platter clean. Anwick Arthur was returned in fine fettle and went through to the championship over a number of very high class younger horses. The same firm had the champion mare with Blackhawk Chessie, one of the rarest types seen in a Western show ring in years. She is a beautifuliy turned mare with a way of going that is caiculated to down competition. She was given a run for the money in class, however, by her stable mate, Hawton Bounce, a mare with more substance but lacking the flash of the champion. A half-sister of the champion, the yearling, Blackhawk Choice, is a sweet filly that promises much. The Blackhawk horses were sent into the ring in top condition and made a very finished show in each class.

The Percherons

For the fifth time Mr. Bassett of Hanford returned the grey Ithos to be made champion, a record scarce equalled at any show by any exhibitor. The 11 year old stallion retains the same degree of quality in underpinning that has sent him to the top in the past and time has not affected his straight and true way of moving. N. Thompson of Patterson showed a particularly attractive lot of young stuff remarkable for their quality and cleanness of joints. His three year old, Sensation, a growthy colt with a pleasing top and a trot that will attract in any company was chief contender for the championship, but the judge preferred the older horse on account of greater substance.

James Marwick of Santa Barbara had the champion mare, Fredora, a daughter of Superior. H. S. Learned of Stockton also exhibited.

The Belgians

N. Thompson and the Merritt-Bowers Company of Tulare made the Belgian show. The latter firm had the first prize aged stallion with the big, bold going, Stevenot. Thompson was first and second in the three year old class and his winner, Labaurer was made champion. Merritt and Bowers had the champion mare, Raby.

The Clydesdales

O. H. Brandt, Sheliville, was the only exhibitor of Clydesdales.

THE MILKING SHORTHORNS

What was declared to be the best show of Milking Shorthorns ever held in this state was provided by five exhibitors. Classes were better filled than usual and the quality was a surprise to all who have not watched the development of this breed in California.

There is much interest in Milking Shorthorns and the show was a credit to the promoters of the breed. Thos. Harrison of Santa Rosa had things his own way for the bull champion and divided the female championships with Alexander & Keliogg of Suisuin. John C. Burns of Texas, who judged the classes, spoke very highly of the exhibits.

Awards on this class were by mistake placed in first column of Page 355 of last week's issue just after the comment on Beef Shorthorns and before Beef Shorthorn awards.

CHOLERA KILLS FEWER HOGS

According to records of the United States department of agriculture for the 13 months from April 1, 1918, to April 30, 1919, hog cholera killed 2,815,004 hogs valued at $62,042,688.16, in the United States. This is the lowest loss by numbers for a similar period in the live stock history of the United States, but on account of the high price of hogs the monetary loss was heavy. For example, during the year ending March 31, 1913, hogs numbering 6,064,470 and worth $58,833,653 died from cholera, while the next year the disease took 6,304,320 hogs worth $67,697,461.

Department experiments show that timeliness in vaccinating hogs against cholera is all important. When exposed hogs were vaccinated while still apparently healthy, losses amounted to only four per cent, but when vaccination was deferred until the animals showed external signs of sickness, losses averaged nearly 29 per cent. This shows that the man who puts off the preventive treatment until his hogs are sick with cholera stands only about one chance in seven of preventing fatal results. It is important, also, to maintain hog yards and barns in clean and sanitary condition.

KLAMATH RIVER COW TESTING

The July report of the Klamath River Cow Testing Association shows 23 cows giving above 50 pounds butter fat for the month. The highest record was held by a grade Jersey belonging to U. M. Del Ponte, which produced 71.1 pounds butter fat from 1271 pounds milk testing 5.6 per cent. Two other cows came about the 60 pound mark; another in the herd of Mr. Del Ponte giving 61.9 pounds fat, the second a grade Jersey belonging to A. W. Green, which produced 61.4 pounds.

AUGUST RECORDS IN ALAMEDA COW TESTING ASSOCIATION

The Alameda Cow Testing Association reports 15 cows which have produced during August more than 45 pounds butter fat or 1200 pounds milk. Bernetta, a registered Holstein of the Koopman Dairy Company, carries away the honors with 69.62 pounds fat to her credit. The next highest record is held by a grade Holstein belonging to the Innis Dairy Company, which gave 59.94 pounds. Third in the list is a registered Holstein, the property of Mrs. F. Stenzel, which gave 58.91 pounds fat.

CULL POTATOES PRESSED FOR SWINE

Dried pressed potatoes, when fed in combination with such materials as oil-meal, fish-meal and tankage, rich in protein, produce rapid gains and excellent finishing properties. Why not utilize unsalable, cull vegetables this way, instead of permitting them to rot? Every pound fed to swine is profit.

50 Registered Holsteins 50
at Public Auction

Having leased their ranch, Agee Bros., owners of Paragon Herd, Brawley, California, will sell at public auction 50 registered Holstein cows, heifers and bulls, from their highly bred herd. The sale will be held on the

Harold Bell Wright Ranch
Meloland, Imperial County, California
Wednesday, October 8, 1919

All of the bred females in this sale are in calf to TOYON FAYNE VALDESSA, who is by the 41 pound bull King Valdessa and out of a 30 pound 4 year old daughter of King Hengerveld Aaggie Fayne, sire of some of the greatest short and long time heifers of the breed.

A Great Offering of Bulls

There will be a good selection of highly bred young bulls in this sale, many of them sired by TOYON FAYNE VALDESSA and out of some of the best cows in the herd. Seldom have dairymen and breeders been offered such a range of selection in good young bulls in a Southern California sale.

Every Animal Guaranteed to be a Breeder

Catalog free on request.

Note:—The sale will start promptly at 10 A. M. Parties going in by train get off at El Centro, where conveyance will be found to sale.

Prince Walker Cornucopia

The Highest Record Son of Prince Gelsche Walker

His dam: ALBA SADIE CORNUCOPIA CREETA has just completed official records of 36.26 pounds butter from 516.7 pounds milk in seven days. Her previous records were as follows:

At seven years—	
Milk 338 days	18,849.40
Butter	866.28
At six years—	
Butter seven days	34.13
Milk	532.40
At five years—	
Butter seven days	28.85

She is a daughter of Sir Sadie Cornucopia, son of the first 30 pound cow, Sadie Vale Concordia.

Over 60 of our best females are bred to PRINCE WALKER CORNUCOPIA, and he will be given the fullest opportunity in this herd. Put one of his young sons at the head of your herd.

LIVE STOCK MEN PLAN CENTRAL ORGANIZATION

A plan for organizing the purebred live stock interests of California into one big organization for the mutual welfare of the industry was launched at a meeting held at the close of the state fair. The organization will be perfected with a gathering to be held during the California International Live Stock Show at San Francisco during the first week in November.

Many matters vitally affecting the entire purebred business arise quite frequently in this state without any central body to take care of them, so it was decided by a hundred or more stockmen showing at the state fair that they had better get together. Legislation in which all have a kindred interest can best be handled in this way, and many arrangements at the live stock shows and fairs can be adjusted to meet the requirements of the breeders providing they can make their wants known in proper shape.

It is not the purpose of the contemplated organization to in any way assume any of the functions of the already established breed bodies or associations of different branches of the live stock industry, but to act upon such matters where the interests of all are equally concerned.

Each live stock and poultry asosciation will be invited to send two delegates with credentials to the San Francisco meeting, at which time a constitution and by-laws will be adopted.

Prof. J. I. Thompson of the University of California presided over the meeting.

PURE BRED SALE

The Southern California Fair Association will hold its fair at Riverside, October 7-11, and is featuring one event which will prove of lasting benefit to the live stock industry of the state. It has secured consignments of pure bred dairy and other animals which will be sold at public auction on Friday and Saturday of fair week. Secretary Van Pelt writes:

In this sale will be some 20 bred heifers from Geo. A Smith & Sons' ranch at Corcoran. There will be about 18 Guernsey cows and heifers from the Palo Alto ranch and a fine string of Jerseys from some of the best herds in California, and Shorthorns from the Hall Ranch at Perris and from recently received Eastern stock. Goats will also be included in this sale and some of the best bred animals in the state are listed.

In the swine sale some splendid animals will be offered. There will be bred Duroc, Poland-China, Hampshire and Berkshire gilts.

Elliott-Brant is consigning some very fine stuff. Frampton Brothers of the Arden Dairy, at El Monte, will give us a half a dozen fresh Jersey heifers, and the other stock comes from the best ranches.

Col. W. C. Lookingbill, who will cry the sale and knows this class of stock, has personally inspected nearly all and reports "absolutely all right stock."

QUALITIES THAT MAKE FOR SUCCESS

No great success can be hoped for without courage, persistence, enthusiasm and resourcefulness. In addition to these, there is such a thing as the habit of success. A man possessed of these attributes can undertake and carry forward to success an enterprise that would fail in the hands of one less favorably equipped. Some men don't recognize such a thing as failure. They have such a masterful way of meeting and overcoming obstacles, as to compel success under almost any conditions. The man who "wonders if he will succeed," who will "try it and see how it goes," is quite likely to fail. His mental attitude favors failure. Not so with the man who knows he will succeed. Study the situation carefully and thoughtfully; let the decision be a wise one; but, once it is made, never court failure by doubting.

Fortunately, these success-attributes are capable of cultivation.

BERKSHIRE BREEDERS HOLD BANQUET AND MEETING

The Berkshire hreeders and their guests banqueted at the Sacramento Hotel, Sacramento, the evening of the second of Septemher. President Humphrey presided and spoke on the results accomplished in the holding of the community sales the pats year. Wyman N. Lovejoy of Illinois gave a short talk complimenting the hreeders on the class of Berkshires they were hreeding here in California. Other speakers were J. Francis O'Connor, Senator Leavitt, W. F. Sandercock, James Mills, J. I. Thatcher, Prof. J. I. Thompson, H. C. Muddux, Ruland Hardy, A. H. Keane, George Upham, Ord Leachman, T. F. McConnell and B. S. Bennett. A resolution was passed requesting the legislature to suhmit to the people a hond issue of $1,000,000 for improvements on the state fair grounds. The organization also passed a resolution thanking Judge Lovejoy for his efficient judging at the state fair. Following the banquet a meeting of the hoard of directors was held and it was decided to hold a bred sow sale in the southern part of the state some time this winter.

POLAND-CHINA BREEDERS HOLD ANNUAL MEETING

The Poland-China hreeders held their annual business meeting at the Travelers Hotel, Sacramento, Wednesday evening, September 3. General promotion plans were discussed and it was decided to hold a bred sow sale at University Farm, Davis, during stockman's week next winter. Subscriptions were taken for a general publicity fund and $1000 raised for this work. A resolution was adopted requesting the legislature to permit the people to vote upon the issuing of $1,000,000 in honds, the money to be used in huilding new buildings and making needed improvements on the state fair grounds. A meeting of the association will he held in Modesto the evening of Octoher 4, just prior to the Marsh and McCracken sale, that they may meet the farmers of the community and try and interest them in Poland-Chinas.

Three cups will he offered next year, one for the state futurity, one for fat barrow under one year and one for fat harrow under six months. The following officers were elected for the ensuing year: President, Wm. Bernstein; vice president, Geo. V. Beckman; secretary-treasurer, A. D. McCarty. Directors, M. Bassett, A. J. Elliott, Fred Gatewood, E. Miner and R. J. Yates.

ESTIMATING SILO CAPACITIES AND SILAGE WEIGHTS

The extensive use of silos is responsible for numerous calls for information regarding the capacity of silos and for an estimate of the weight of silage under a variety of conditions. The common method of making such estimates is by the use of tahles of silo capacities puhlished hy silo manufacturers and hy experiment stations. These tables are hased directly or indirectly upon a tahle puhlished by King of Wisconsin in 1893. Recent investigations show that even when these tables are used according to the directions of the originator, the results are too high, hut as generally applied the tonnage is often estimated 25 per cent too high. The Missouri and Kansas agricultural experiment stations have taken the weights of silage in 32 silos, representing four seasons. From these figures it is learned:

That the tonnage of silage is usually estimated too high hy tables in common use.

That the weight of a cubic foot of silage at the time filling is completed varies widely, according to depth of the silo, percentage of water present, proportion of grain, thoroughness of packing, rate of filling, and diameter of the silo. In silage that has had time to settle, the method of filling will be of minor importance as influencing the weight, hut all the other causes for variation still exist.

That a tahle used to estimate the capacity of a silo or the weight of silage at the time filling is completed is not adapted to estimating the weight of settled silage.

That on account of the many complications influencing the weights of silage it is impossihle to give any estimate of weight that is more than an approximation. When silage is bought or sold it is recommended that it be weighed whenever possihle rather than to estimate its weight.

CREAM SEPARATOR EXHIBITION AT UNIVERSITY FARM

A cream separator exhihition and demonstration on the afternoon of October 6 in connection with the creamerymen's short course at the University of California Farm from Septemher 29 to November 8 is announced hy the dairy industry division of the University Farm.

Manufacturers of the various cream separators to he on exhibition in the dairy huilding at the state fair have heen invited to send representatives to point out the desirahle features of their respective machines and to demonstrate the use of the equipment in actual cream separation. Persons interested in dairying whether attending the cream short course or not are invited hy the University of California to be present for the exhihition.

MARKETS LAMB BY PARCEL POST

A sheep raiser who sends his meat to market through parcel post tells the Arizona college of agriculture how he does it:

"In the first place the lambs should be fat, and the fat should he put on quickly, through the use of the widest variety of feeds. They should he butchered right, that is case skinned and neither the hands nor the wool should touch the carcass while it is still warm. The kidneys should he removed, in warm weather.

"I split the carcass down the middle with a saw and divide the halves into quarters, leaving two short ribs on the hind quarters; wrap the meat in white cloth, then in paper and then in burlap. I use a return shipping tag and the customers may return the wrapping in good condition. If they do not, I charge them up with it at the end of the month.

"I send meat 85 miles hy auto stage, but cannot as a rule supply the local demand so keep close to home. Our trade has developed out of our custom of taking a roast leg of mutton to picnics or to celehrations on the Fourth of July or other holidays. I know how to dress the meat and my wife knows how to cook it."

SELECT SORGHUM SEED IN FIELD

A great improvement may he made in the sorghum crop if careful seed selection is practiced. Increased yields and improved quality of grain and forage are hoth possible. In most sorghum fields today one can find great variations in the plants. Some are very short; others are very tall; some have many suckers; others have none; some have large, compact, well-filled heads; others have loose heads containing but very little seed. The only way to secure uniformity in the crop is to pick seed from those plants which have the desired qualities.

Before the main crop is harvested the field should be gone through and the seed gathered. Choose large, compact, well-filled heads from thrifty plants of uniform height. Many sorghum plants have large heads, which if examined closely, are found to he very loose, poorly-filled, and consequently yield little grain. Such heads should never be saved for seed.

After picking spread the heads out to dry on clean ground, on the barn floor, or some similar place. Stir the heads frequently with a fork to insure thorough drying. Heating will always occur if moist heads are piled together and left untouched. When thoroughly dry, the heads may be thrashed and the shelled grain stored, or the dried heads may be placed loosely in grain sacks and hung in a dry place.—G. S. Ray, Colorado Agricultural College.

ANTHRAX WELL UNDER CONTROL NORTH OF SACRAMENTO

The state department of agriculture has had two men investigating anthrax conditions in Glenn, Colusa, Butte and Sutter Counties. Dr. Iverson, chief of the hureau of animal industry, has referred to Director Hecke a detailed report which shows that the disease in these counties is now well under control and does not appear to have made as serious inroads as occurred last year.

Herd Building is Dairyman's Problem

Dairy farming consists in more than producing milk; it includes the raising of heifers to replace animals in the herd that must be discarded because of failure to breed, old age, sickness or death, says W. W. Swett of the University of Missouri college of agriculture. The dairy farmer who pays the greatest attention to the raising of calves is usually the most successful.

According to recent reports there are more than twenty-three million dairy cows in the United States. The average productive life of the dairy cow is not more than six years, which means that the farmer with 12 cows must have two heifers coming into milk every year to maintain the number of animals in his herd. It means also that the whole number of cows in the United States must be replaced every six years and that approximately four million must come into maturity each year in order to maintain the number of cows in the United States. This number does not provide for increasing the total to meet the demands of the ever growing population of the country. Not only is this population increasing, but a knowledge of the value of dairy products has brought about a greater consumption, the demands for which must be met in some way. The cow does not usually become productive until she is at least two years old. The number of unproductive dairy heifers to be maintained in an immature condition is approximately eight millions. It costs about $70 for feed to raise a dairy heifer to the age of two years. This means that the farmer with 12 cows must of necessity raise two heifers each year, or, that he must at all times have on hand four unproductive heifers. At $70 a head for cost of feed alone, this represents an investment of $280, simply to insure maintenance of the number of animals in the herd. The dairy industry in the United States has approximately $560,000,000 invested in these unproductive animals. Regardless of the cost, the dairy business must be maintained and these heifers must be raised.

There are two methods of replacing animals discarded from the herd; one is to buy heifers or mature cows on the open market, and the other is to raise the heifer calves which are dropped in the herd. The former method requires perhaps less effort and less time and attention on the part of the dairyman, but it has serious drawbacks.

First, it is expensive; particularly because the good cows, which are the desirable ones, are not for sale except at very high prices, while the undesirable ones, or "culls," are on the market at a much lower figure. It is readily understood that the man who goes to the trouble of raising his heifers to sell, does so only when he can realize a profit. The buyer pays, therefore, the actual expense of raising the heifer, plus some profit. Even after going to all the expense of searching out the heifers, transporting them to his farm and paying a good price for the privilege, the farmer is almost sure to find that some of them are unprofitable and must be disposed of. In addition, when cows are purchased there is always serious danger of introducing diseases such as tuberculosis or contagious abortion. A fact even more important is that the dairy farmer should be interested in his work with the idea of making improvement and progress, and he should consider dairy farming as a breeding proposition with great possibilities for improving his herd. Also he should realize that whenever the practice of buying rather than raising heifers is followed, the production of the herd is low and there is never much tendency for it to increase.

What is Breeding?

The following definitions have been adopted by the United States Department of Agriculture for use in the "Better Sires—Better Stock" campaign which it will conduct in cooperation with the various states, beginning October 1:

Purebred

A purebred animal is one of pure breeding representing a definite, recognized breed and both of whose parents were purebred animals of the same breed. To be considered purebred, live stock must be either registered, eligible to registration, or (in the absence of public registry for that class) have such lineage that its pure breeding can be definitely proved. To be of good type and quality, the animal must be healthy, vigorous, and a creditable specimen of its breed.

Thoroughbred

The term "thoroughbred" applies accurately only to the breed of running horses eligible to registration in the General Stud Book of England, the American Stud Book, or affiliated Stud Books for thoroughbred horses in other countries.

Standardbred

Applied to horses, this term refers to a distinct breed of American light horses, which includes both trotters and pacers which are eligible to registration in the American Trotting Register. Applied to poultry, the term includes all birds bred to conform to the standards of form, color, markings, weight, etc., for the various breeds under the standard of perfection of the American Poultry Association.

Scrub

A scrub is an animal of mixed or unknown breeding without definite type or markings. Such terms as native, mongrel, razorback, dunghill, piney woods, cayuse, broncho, and mustang are somewhat synonymous with "scrub," although many of the animals described by these terms have a certain fixity of type even though they present no evidence of systematic improved breeding.

Crossbred

This term applies to the progeny of purebred parents of different breeds, but of same species.

Grade

A grade is the offspring resulting from mating a purebred with a scrub, or from mating animals not purebred, but having close purebred ancestors. The offspring of a purebred and a grade is also a grade, but through progressive improvement becomes a high grade.

Thanks to an overruling power, the products of the dairy do not need to be camouflaged or compared or likened to any other product. They contain sufficient merit and have been given a prominent enough place in the dietary of man to justify the best advertising that the mind of man can put together in their behalf. But advertising costs money and there is the rub. One cent on every hundred pounds of milk or one-tenth of one cent on every pound of butter fat would not be much for each individual, but it would create a fund of considerable size if every hundred pounds of milk handled as such or every pound of butter fat marketed as such were thus taxed.—Kimball's Dairy Farmer.

TRUTH WILL OUT

As an illustration of great devotion to truth, a would-be M. P. told his auditors that he "underwent a severe thrashing when a boy for telling the truth." Imagine the sickly feeling which came over him when a gruff voice called out from the center of the audience: "I guess it's cured yer, guv'nor!"—Christian Life.

AN IDEALIST

"Do you love me, darling?" she coaxed.

"Sweetheart, I love every hair on your bureau!" he fervently answered. —Gargoyle.

Eldorado County farmers are forming a cow testing association to raise their dairy cow standard.

Pork Production

By Actual Test Pure Hawaiian Cane

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

Write us immediately for a copy of above test.

For Sale—30 Acres Alfalfa. Write me for descriptions, price, terms. L. E. Williams, R. D. No. 1, Box 10-B, Imperial, California.

CATTLE

Dispersal Sale—Brookhollow Farm, Hollister, San Benito County, Calif., will sell at public auction their entire herd of high grade Holsteins numbering 135 cows and heifers in order to make room for the expansion and development of their herd of registered Holsteins. This is the well known herd developed and formerly owned by J. Lansing Lane, and is the product of carefully selected high producing cows mated with richly bred registered Holstein bulls for many generations. Every cow in herd has an accurately kept private milk record, some going above 16,000 lbs. in one lactation period. All records will be announced at sale. Among the four registered bulls to be sold is Juliana King Pride, a son of the famous sire Juliana King of Riverside, who has three daughters above 1000 lbs. butter in one year, and is the sire of King Mead of Riverside, the breed's leading sire of high testing daughters on yearly test. The farm is six miles northwest of Hollister, eleven miles south of Gilroy on Bolsa Road. Parties going by train change at Gilroy to the Hollister train and get off at Hudner Station where conveyance to sale will be found. Sale begins 10 A. M., Thursday, September 25. Auctioneer—Col. Ben A. Rhoades, Los Angeles; Sale Manager, C. L. Hughes, Sacramento.

Complete Closing Out Sale—San Mateo Dairy Ranch Co. will sell at public auction, on their ranch near San Mateo, Saturday, September 27, beginning promptly at 9 A. M.: 225 Holstein dairy cows, all young and in fine condition. Herd has been carefully culled for eight years, and present herd is exceptionally high grade throughout; dairy equipment consisting of one Cyclops ice machine and ammonia cooler complete with engine, etc., in excellent condition, aerators, sterilizers, pails, cans, etc.; implements consisting of milk wagons, grain wagons, swill wagons, plows, manure scraper, wheelbarrows, cars and one-half mile of track, silo, windmill, furniture, etc.; feed, consisting of 60 tons baled alfalfa, 100 sacks mill run, 125 sacks beet pulp, etc.; a blacksmith shop complete; seven good all purpose horses. Terms on cattle $100 and under cash, over $100 one-third cash, balance 3-6-9 months with note and approved security and 8 per cent interest. Liberal discount for cash. Everything except cattle sells for cash. Autos from San Mateo go 1½ miles south on main road and turn off to left toward Bay near the salt works. Buyers coming on train will be met by auto at San Mateo and conveyed to sale. Auctioneers: Rhoades & Rhoades, Los Angeles; Sales Manager, C. L. Hughes, Sacramento.

Auction Sale — Coast Dairies and Land Company, will sell at public auction, on Yellow Bank Ranch, two miles south of Davenport, Santa Cruz County, on Monday, September 29, 1919, beginning promptly at 9 A. M.: 100 Holstein dairy cows, all nicely marked, all first, second and third calf heifers, all raised on the ranch from the biggest producing dams and high class sires. This is a top herd in every respect; cheese making outfit complete; cream separators, milk cans and pails, all other dairy equipment and outfit of general farm implements. Terms on cattle: $100 and under cash; over $100 one-third cash, balance 3-6-9 months with note and approved security with 8 per cent interest. Liberal discount for cash. Buyers coming by S. P. train will be met at Davenport. Auctioneers, Rhoades & Rhoades, Los Angeles; Sales Manager, C. L. Hughes, Sacramento.

BUTTE CITY RANCH

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Stifle Out

I have a very valuable two year old mare colt that has been bothered for the last month with the stifle joint slipping out of position. Two or three times both sides were out at the same time. What can be done for it?—Subscriber, McKittrick.

Some horses are so loosely built that the ligaments about the joints are too flabby to hold the parts in place. Proper feeding will help. Oats is the best feed to build up the soft tissues. Give the colt some lime in the drinking water and a teaspoon of the tincture of iron in the feed once a day for three or four weeks. Some use blisters on the joints but that does little good unless the system is built up to supply the lacking material. A spray of cold water on the joints for half an hour once a day is also beneficial.

Lame Pigs

I have a sow that began to limp on left front foot. At first could see nothing wrong but it soon began to swell and is now quite large. Also the left hind foot is becoming affected in the same way. I lost a pig about two months ago that was affected the same way and now I have two pigs weighing about fifty pounds each that are each lame in one foot.—Subscriber, Coalinga.

We would advise examining the feet. Think you will find them injured in some way. Someone may have dropped some tacks where the pigs could step on them or some broken glass may be scattered about the yard. Examine the feet and examine the ground where the pigs are kept.

Wash the lame feet and if a wound is found enlarge it so you can cleanse it out to the bottom and wrap it with cotton soaked in turpentine. Then keep them on a dry clean place until healed.

ASSISTANT SECRETARY OF AGRICULTURE

The new assistant secretary of agriculture, James R. Riggs, whose nomination has just been confirmed by the Senate, is a farmer—not merely by way of interest in the subject but by life-long, practical application. Farming has been his primary occupation all his life. More than that, he is a farmer by heredity.

FAIR DATES

Box 11 D Compton, Calif.

When Writing Advertisers, Mention The Cultivator.

If you really want the puckery tannin-taste, don't buy tea. You can get more tannin from oak-leaves.

If you want the real tea-flavor, pay enough for your tea to get it.

There is some tea-taste—not very fine—in common tea; but the tannin-taste smothers it.

Besides, fine tea is cheaper per cup than poor tea—a pound makes so many more cups.

Schilling Tea is the fine practical economical tea of this country.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

Household Department

WE THANK THEE

For days of health,
For nights of quiet sleep,
For seasons of bounty and of beauty,
For all earth's contributions to our need,
Good Lord, we thank Thee.

For our country's shelter,
For our homes,
For the joy of faces, and the joy of hearts that love,
Good Lord, we thank Thee.

For the power of great examples,
For holy ones who lead us in the ways of life and love,
Good Lord, we thank Thee.

For our powers of growth,
For longings to be better and do more,
For ideals that ever rise above our zeal,
Good Lord, we thank Thee.
For opportunities well used,
Good Lord, we thank Thee.

For opportunities unused and even those misused,
For our temptations and for any victory over sins that close beset us,
For the gladness that abides with loyalty and the peace of the return,
Good Lord, we humbly thank Thee.

For the blessedness of service,
For the power to fit ourselves to other's needs,
Good Lord, we thank Thee.

For our necessities of work,
For burdens, pains and disappointments, means of growth,
For sorrow,
For death,
Father, we thank Thee.

For all that brings us nearer to each other, nearer to ourselves, nearer to Thee,
For life,
We thank Thee, O our Father.

—The Associated Monthly.

RALPH MASON PLAYS THE GAME

By David Wallace in Successful Farming

RALPH MASON had just delivered the last of his 25 barrels of Bliss Triumphs, slinging it up on the landing with the ease and agility of an athlete taking his morning exercise. As he seized the reins and turned to the big overalled potato handler, who was adding up a column of figures in chalk on the side of the 500 barrel bin he looked more like a warrior on the verge of a struggle to the death, than a farmer getting ready to play the market.

"That makes 800, Charlie, doesn't it?" he said. "Yes—let me see—yes, just it," he answered. "Eight hundred at a dollar twenty-five a thousand dollars even. I will telephone the office and you can get the receipt on your way uptown." As Mason jumped into his jigger and cracked his whip over the heads of the big iron greys, the clerk shouted after him: "How about selling us 500, Ralph? Give you one thirty."

"Guess not, now," he answered as he started the horses on the run over the railroad crossing, just ahead of a puffing freight train. The 800 barrels settled his fertilizer bill at a price agreed upon last spring. Now he was going to wait and play the game, and how much depended on the final score this time, only he and Kate knew. Kate? Maybe she did not care at all!

A little over two years before he had struck the bustling town gaunt and ghostly, the red flag of the white plague already planted on his flushed cheek, determined to try nature's great sanitarium, the big woods to the west of Aroostook's garden patch, a hundred miles by a hundred and fifty and the ozone four miles high.

Three months of the glorious treatment had wrought such wonders that when he returned to the big town and found it tingling with the bustle and excitement of November shipments quoted at two dollars already, and everybody watching the ticker, he had jumped into the first position that opened up and in the months which followed had caught the Aroostook fever and was buying and selling potatoes like a veteran.

By the last of March he had made up his mind to take a hand at producing as well as speculating, and had hired 30 acres for the season at 20 dollars an acre.

It was a fool enough undertaking as he had learned at bitter cost, a case of the raw recruit charging with bare hands where the veteran crawls on all fours pushing his Mauser ahead of him; but he had made the plucky fight which always wins admiration, nowhere so generously as among the lion hearts of Aroostook, and now burdened by debt and handicapped by shaky credit he was facing the real crisis of the adventure.

As the iron greys stepped briskly along, Mason was startled by an explosive greeting from a big, rosy-cheeked, sharp-eyed fellow, riding on the top of his 40 barrel load.

"Hullo, Ralph!" he shouted, driving over along side. "How are they comin'? What are you getting?"

"O, I was just finishing my contract with the Packards," he answered. "Dollar twenty-five it called for. Not so bad I guess; just about the going price, isn't it?"

"Yes, I reckon so," responded the first speaker with a grin and a wink, and giving his whip a crack that set the bays prancing and rearing, "but I am going to make a big bluff for ten more. My 25 years' experience, boy, has learned me that you can't take the 'apsy-dicket' of every cut throat buyer for the gospel truth."

And then drawing a little closer and dropping into a confidential tone, he gave the young man a knowing wink adding, "And let me give you a pointer, Ralph, as a man who knows a little something about this and one that would dance with Sally Delancy, the homeliest old maid in these diggings, to see you come out a winner this time. I'd advise you to get right back to the hill and hustle your Irish Cobbler seeds into the cyclone cellar, and then get out and unload your 'Mountains' just as fast as you can make 'em bite. This is one of the earliest seasons Aroostook has ever known. The vines look pretty fair and the diggin' ain't bad so far, but the heavy rains have made mudholes of the valley farms and the cobwebs are getting thicker than ants in molasses. If you play your cards right, Ralph, this is the time you will get your pay for working that side hill patch. Mark my words! Within 20 days there will be the greatest hullabaloo over the rot that Aroostook has ever heard." Puffing away at his clay pipe for fear of betraying unseemly excitement Mason listened with the intensest interest and under pretense of using his handkerchief, spat the piece of broken stem that he had shattered between his teeth, into it.

"I have a lot of reasons, Hackett, for regarding you as a friend, and I have the greatest respect for your judgment, but I had been reading up everything I could find on crop prospects throughout the country and I had made up my mind that the waiting game was the thing for this year. I don't mind telling you, Hackett, that I am up against it for fair this time. It is either hunt tiger or tiger hunt."

"The waiting game?" the big fellow broke in with a convulsive laugh. "I'll give you a chance to play it all right, to play it till every nerve of your body squeals like a trapped mink, but before you begin I want you to try the hit and run trick—and listen!" he added giving a sharp sweeping glance up and down the street, "do you believe that my word is as good as paper and that my paper is as good as any man's on the street, up to six figures split in two? You do? Then you know where to come to if you want a little accommodation."

So saying, he gave his whip a crack that set the big bays dancing and tugging, and started every dog on the street on the rampage.

As Mason started slowly along, the cold sweat broke in beads all over him. In less than 30 seconds, every wheel in the delicate machinery of his thinking box was whirling around at high speed. He was not the man to let another dictate to him, or override his judgment, friend or foe, but the ice was a little too thin and brittle under his feet to make it sensible to despise any outstretched hand, and especially the big nervous fist of such a powerful ally!

As he approached the business center the uproar and excitement of the annual twin festivals, digging time and the big fair, were in evidence everywhere, jiggers loaded and empty, moving in every direction, all kinds of carriages from ox carts to next year's autos plodding and whizzing along

or lining the curbs, and the sidewalks, stores and street corners crowded with every specimen of picturesque humanity; tramps, buyers, hunters, drummers, fakirs, lumberjacks, Mormon missionaries and all the rest. Here and there he recognized a face and returned a greeting, but he moved on half unconsciously, passing the office which had been his immediate objective point and heading for the open country beyond, the iron greys setting their own pace and making their own trail. A little beyond the last business block an imposing Packard whizzed by and he started as if struck in the face, the reins tightening in his hands and the horses starting on the run. O, yes, it was Kate all right on the front seat, as handsome as a queen, and Gibson himself at the wheel. Gibson! the man he feared the most and with mighty good reason, the plunger of the street who had dropped a thousand dollars a day for 30 consecutive days the year before and laughed at it, the man who was the most respected and the most hated of all the operators of this little Wall Street of the Aroostook!

Laughing a bitter laugh he suddenly started and seizing the whip swung it with savage force across the horses' backs, an act so bewildering that the petted animals balked and reared and brought the jigger to a dead stop.

Was it possible that Gibson was responsible for that scaly transaction that cost him fifteen hundred? He was the very man that advised him to ship to those New York skins? And that other break selling long and buying short which accounted for another thousand dollars of his millstone! There was something about the deal that he could never quite comprehend. Now he recalled how Hackett had touched him on the shoulder about that time remarking;

"It's a long way to the Bowery. Ralph, but look out for the loaded dice."

(Continued next week.)

HOUSEHOLD QUERIES

Good Loaf Cake

Please give me a recipe for plain loaf cake that will keep fresh several days, some suitable for lunch boxes.—Subscriber, Sierra Madre.

Here is a good economical loaf cake: Two eggs beaten together, one cup sugar, one cup flour (rounded before sifting), one teaspoon baking powder. Sift flour and baking powder together twice. One-half cup hot milk, one tablespoon butter in milk, a little salt, flavoring. Bake 45 minutes in moderate oven.

For a good keeping cake, that is one that will stay moist, there is of course nothing to compare with apple sauce or prune cake or a cake of that nature that incorporates fruit jam as its make-up. A good cake is the following: Two cups sugar, one-half cup butter, two cups apple sauce, two teaspoons cinnamon, one teaspoon cloves, one-half teaspoon salt, two teaspoons chocolate, two teaspoons soda stirred in apple sauce, two and one-half cups flour (measured before sifting), one cup nuts cut coarsely, one cup seedless raisins. Bake one hour.

The Cultivator will be glad to publish some good cake recipes, preferably simple ones. For these six months to one year's extension of subscription will be credited to sender. With recipe please send name and address of one to whom you wish subscription credited.

Smoked and Cured Salmon

Please give directions for smoking sugar cured salmon.—Subscriber.

In the issue of July 13, 1918, the Cultivator gave extended directions for home smoking of fish previously cured in brine. This has been mailed to our inquirer. As to sugar curing we are not informed. Can our readers help us out? We recall that some years ago a subscriber in the northern part of the state gave directions for curing salmon but we do not have the recipe at hand and do not remember that the salmon was sugar cured. But we have never yet failed to receive response to calls for help of this kind, so we think that in a week or two our inquirer will find on this page the directions she asks for. Subscription credit will be given for recipes published.

FIG AND GRAPE PRESERVES

By Mrs. J. J. Dean

To Preserve Grapes Whole

Select grapes that are ripe but not too mellow. Strip from the stems and wash thoroughly; then place in fruit jars, filling the jars quite full. Pour into these jars all the boiling water they will hold and let stand for five minutes. At the end of five minutes pour off water and again fill with boiling water. Repeat the third time. Fill the jars with a boiling syrup made of one pound of sugar to one quart of water, and seal jars.

To Preserve Figs

Take ripe but firm figs. White figs are preferable as they need not have skins removed. Wash thoroughly and let stand over night in a weak brine. Next day put them in fresh water for an hour. Pour off water and drain, then pour over them a hot syrup and boil 10 minutes. Let them remain in this syrup over night. Pour off syrup next day and boil 10 minutes and again pour over the fruit. The third day boil the figs in the syrup until the fruit is of a transparent color. Place in jars and seal. For those who do not care for a rich preserve, a syrup made of one pound of sugar to one quart of water is sufficient. A lemon sliced in the syrup is an improvement.

PICKLING BITS

Grape leaves give a green color to pickles, and produce a pleasing, characteristic flavor. The color is heightened by pouring the vinegar cold over the pickles and gradually bringing to the boiling point.

Alum water makes pickles crisp, one teaspoon for one quart of water is enough.

The receptacle, holding pickles during their making, should be well protected from dust.

Always use a good grade of vinegar for pickling and fresh, crisp, perfect vegetables.

Twenty-four hours is long enough for the pickles to soak in the brine solution; if left in longer, they will shrivel.

One to one and one-half cups of salt for each gallon of water makes a good brine for pickles.

A little bit of horseradish added to the vinegar will prevent scum from forming.

Tie spices in a bag, when adding to pickles; otherwise they will cause a dull appearance.

Vinegar boiled too long will become lacking in strength. Pickles heated too long in the vinegar become soft.

Spices not tied in bags, and boiled in the vinegar give a strong, undesirable taste.—L. B.

MUSTARD PICKLES

Four quarts green tomatoes, one cauliflower, one quart small onions, one quart small cucumbers, six green peppers, six red peppers (sweet), or one can pimientos; one pint green beans, one pint white wax beans, one head celery, two tablespoons mustard, one-half teaspoon turmeric, one and one-half cups brown sugar, three-quarters cup corn starch and flour mixed, two quarts vinegar, one pint water.

Cut vegetables into pieces and cover with a brine made of one cup of salt to one gallon of water. Let stand over night. Then boil in brine for ten minutes and drain thoroughly. Mix mustard, turmeric, sugar and flour and add water to make a paste. Cook until mixture is thick and creamy. It may be necessary to add a little more corn starch. Pour over pickles and seal in jars. Let stand a few weeks before using.—Subscriber, Los Olivos.

TOMMY'S COURTESY

Tommy's father had been giving him lessons in politeness, but hardly dared hope that the seeds of his teaching had taken root.

One day, hearing a noise coming from the nursery, he investigated, and found Tommy pounding his little brother.

"I'm surprised, Tommy," said his father sternly, "that you should hurt your little brother. Don't you know that it is very cowardly to strike one who is smaller than yourself?"

"Yes," replied the culprit meekly, "but when you spanked me yesterday I was too polite to mention it."

The Name Over the Door Is Just as Important as the Name on the Piano

There are hundreds of different Piano makes on the market today—many of these names are unknown to you. Even if you have seen them advertised you are unable to verify the statements made about them, as you have no expert knowledge on the manufacture of Pianos.

That is why the name over the door of the store you patronize is just as important as the name on the Piano. If the name is that of a good reliable Piano Dealer you can rely upon being shown good dependable Pianos—you can rely upon his statements and his advice. The result of your call upon the reliable dealer will be a Piano which will give you years of satisfaction and a feeling that you received full value for the money paid.

We invite you to call at any of our stores—or write us asking for illustrated catalogs and prices.

We are dealers in Steinway and other Pianos, Pianolas and Duo-Art Pianos, Aeolian Player Pianos, Player Rolls, etc.

"THE HOME OF THE HAIRY PERUVIAN"

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the western states that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property.

Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops next year will bring higher prices than now, so take advantage of this condition and get your land under cultivation.

No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 2-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.00	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.
Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00 @54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of September 13, Scott, Wagner & Miller says:

Receipts past week 2722 tons. The car situation has not improved any during the week. The market in this city has run along about the same as heretofore no changes to speak of with the exception that alfalfa hay has been more plentiful and if anything is a shade lower. Demands from country districts have slackened off considerably showing that many have already put in their winter's supply. This same condition applies to local consumers most of whom have already laid in their winter's stock. Fancy wheat or Red oat hay is in demand and very little of this grade has arrived. There is no inquiry for straw.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the Hay Market—for prices to consumer, charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay	
(light 5-wire bales)	17.50@19.00
No. 1 Wheat or Wheat and Oat Hay	15.00@18.00
No. 2 Wheat or Wheat and Oat Hay	12.00@15.00
Choice Tame Oat Hay	15.00@18.00
Other Tame Oat Hay	12.00@15.00
Wild Oat Hay	10.00@14.00
Barley Hay	12.00@16.00
Alfalfa Hay	17.00@22.00
Stock Hay	8.00@12.00
No. 1 Barley Straw, bale	.50@80

Citrus Markets

Los Angeles, Sept. 17, 1919.

The supply of Valencias is being lowered every day, there being in the state around 3500 to 3600 cars yet to go. By the end of the month there will probably not be more than 3000 cars for October shipping. Prices are very satisfactory and in one or two auction sales rather spectacular prices have been secured. In the general market however, there are no exceptionally high prices.
There have been occasional long prices paid for lemons but in the main a very satisfactory condition prevails, prices ranging around $5.00 for good stock.

Shipments

Shipments of citrus fruits to date since November 1, 1918: Southern California: Oranges, 31,859 cars, lemons 8998, total 40,857. To same date last season; oranges, 13,586, lemons 5432, total 19,018. Central California this season: oranges, 4427, lemons 354, total 4781. To same date last season: oranges, 2539, lemons 115, total 2654. Northern California: oranges, 244, lemons 2, total 246. Last year same date: oranges, 203.

McQUAY-NORRIS
Superoyl
RINGS
A special ring for engines that pump oil. Used in top groove only of pistons to control excess oil, with McQuay-Norris LEAK-PROOF Rings in lower grooves to insure maximum compression and fuel economy.

One Cost for Light and Power

BRIEFLY—the Fairbanks-Morse 40-light "F" plant is an exceptional "buy" for these reasons—

Fairbanks Morse quality standards throughout. Engine is our famous "Z"—low speed—throttling governor. Construction of all parts is extremely simple and embodies the best possible workmanship and materials. Instrument board is mounted over the dynamo—dynamo is ball bearing. Push a button to start the plant and push another to stop it. Outfit comes complete, mounted on base. The engine can be used to driv a washing machine—churn—cream separator—etc., independent of the dynamo, either direct or throug' a line shaft.

Your dealer will prove its reliability, point by point, so see the Fairbanks-Morse "F" light plant before you buy any.

Health Hints for High Producers

By Jean A. Koethen

IF THE average bennery hen could read the pages of the average poultry publication she would be surprised, not to say dismayed, at the large amount of space which is devoted to the curing of poultry diseases and the very small amount which deals with the prevention of disease and the symptoms which indicate that her health is below par. Once a hen is really sick there is very little to be done for her. Doctoring is difficult and more often than not hopeless. If she could speak the little business hen that is doing her best every day in the year would surely say, "For pity's sake, keep me well. Don't neglect me till I begin to droop and then trust to dosing me back to health."

The ills that afflict the laying hen may be roughly classified as digestive, respiratory, contagious or infectious and accidental. Under the last class come such troubles as ovarian rupture, poisoning and other affections which cannot be foreseen or prevented. I should be inclined to put the condition known as cropbound in this class. It can be prevented to some extent by cutting up grass and grain but a hen that is on range will eat what she finds, and the occasional crowding of the crop with a mass that cannot be moved is almost unavoidable. Hennery hens, which are always confined, are not often troubled with bound crops.

Where does disease begin? More frequently than not, I believe, in filth. Heaps of manure on the dropping boards and in the yards not only furnish breeding places for mites, but they contaminate the air and pave the way for roup. Roup, scaly leg, intestinal worms, gape worms, are directly due to filthy surroundings. If filth is allowed to get in to the water basins and crocks—and we all know how easily this happens—diarrhoea and dysentery may result. But I believe California poultrymen generally are pretty careful of their water supply. It is in the cleaning of droppings boards and yards that they fail.

I am not scientist enough to explain just how it is that breathing the fumes from a heap of neglected manure all night makes a hen susceptible to roup, but I am satisfied that it does. Droppings boards should be cleaned so often that there is very little odor perceptible when you enter the house. How often this is depends on the number of hens in the house. I find that a house with room for 20 hens needs cleaning twice a week though only a half dozen hens are roosting in it. If the manure is left longer there is more odor than I like, and I can not believe the hens like it any better than I do. When a large flock is roosting in a house that is crowded to its capacity it would seem as if the droppings should be removed every day, but I know many successful poultrymen do not consider this necessary.

But removal of the droppings is only half. After they are removed the droppings board should be covered with dry dirt, sand, or some other dry material to absorb the odor and discourage the invasion of mites. In some up-to-date poultry houses a sand box near the roosts is part of the equipment, and the boards are covered with sand as soon as they have been cleaned. As we are not on sandy soil I have used dry oak leaves mixed with the dry granite soil underneath them, and find they absorb the odor perfectly. The use of lime on the droppings boards is not only unnecessary but is often harmful. One of my neighbors a few years ago lost half her flock from a liberal application of unslaked lime to boards and floors, and only last week I saw a little woman, who had put lime in her house because a neighbor said it was good for the chickens, lamenting the dropping off of hen after hen. Lime is all right in whitewash, but why put it under foot when sand or dry dirt is better and cheaper?

The only satisfactory method of cleaning yards is to remove the birds and plant a green crop in the yard. Many poultry plants now are arranged with double yards for each house so that the hens may occasionally be shifted from one yard to the other. Where there is no such arrangement, and hens are kept on year after year in yards that have only been scraped or spaded, the time comes sooner or later when the yards must be abandoned, at least for a time. A green crop is the only thing that purifies soil completely, and most experts advise the planting of such a crop once in six months. Just how frequently it is necessary depends largely on the character of the soil, but it must be done or the flock moved to new ground.

Symptoms of Disease

Every poultry keeper should familiarize himself or herself with the symptoms of disease, so that they may be detected as soon as there is the slightest departure from the normal. The best way to do this is to have at hand some reliable book or at least a bulletin on poultry diseases. The bulletin issued by the United States department of agriculture, entitled "Important Poultry Diseases" costs nothing but the postal card you use in ordering it, and is a recognized authority. A little book entitled "Poultry Diseases and their Treatment," issued by the Maine Station, Orono, Maine, costs 20 cents, I think, and goes into the cause and cure of all poultry diseases very fully. Then there is the Farm Poultry Doctor by Dr. N. W. Sanborn, published by the American Poultry Advocate, Syracuse, N. Y., which costs 50 cents, I believe, and another by Dr. Kaupp of the Missouri Station, which is perhaps a little more up-to-date. Our own experiment station at Berkeley has published several bulletins which may be had for the asking. There is one on the treatment of worms, another on chicken-pox, and very likely there are some still more recent. It is quite possible for the owner of the smallest flock to train his eye to recognize the first departure from normal in any of his birds and to change conditions or provide some simple remedy. Everyone knows that a hen that goes around singing and displaying a bright red comb is in normal health. It is just as easy to know that when the comb turns dark there is something wrong, probably a clogged liver due to heavy feeding, and that when instead of singing she mopes in a corner she is, to say the least, not in vigorous health and needs watching. It may be she is one of those slacker hens that are just too lazy to scratch, but there is a reasonable presumption that she lacks constitutional vigor. When I see a hen moping like that I kill her and eat her without inquiring farther, for I know she is not profitable.

Doctoring Digestive Troubles

Diarrhoea always means indgestion The hen may seem to be otherwise in perfect health, may be laying and singing, but if there is looseness of the bowels something is wrong in the feeding. Normal droppings are dry and hard. Droppings that are loose and brownish usually indicate a diet too rich in animal food, or it may be that the beef scrap is not as fresh as it should be. In such a case leave the beef scrap out of the mash for a few days and watch results. When the droppings are watery and yellowish or greenish the trouble is more serious, but it is still due to indigestion. It may be the ration is not balanced at all, that there has been excessive use of a single grain to the exclusion of others, or that spoiled food of some sort has been eaten. I doubt if we need in this climate to consider cholera as a possibility. It has been known in California, but is very, very rare. Serious bowel trouble is almost invariably due to improper feeding or a filthy water supply.

The first remedy in all digestive disorders is a dose of physic, preferably Epsom salts, because it is rather more easily given than castor oil Take care that the salts are fresh, for they lose strength if they stand uncovered. Half a teaspoon, or perhaps a little more, is the dose for an adult bird, and it is best given by dissolving in water and then moistening a

small quantity of the dry mash with the solution. Prepare only what the birds will eat up quickly, and if necessary keep other food from them till they have eaten this medicated mash. Some poultrymen put the salts in the drinking water but this is not to be recommended, for you never know how much the hens get, and it loses its strength standing for a day. One dose of salts, with the necessary change in the ration, should be sufficient in light cases of diarrhoea. If it is not the dose may be repeated.

When the crop is sour, a condition indicated by the running of a watery fluid from the mouth and a peculiar soft, inelastic feeling of the crop, soda is sometimes an effective remedy. Dr. Salmon recommends keeping the bird from 12 to 20 hours without food and giving two grains of subnitrate of bismuth and one-half grain of baking soda in a teaspoon of water to relieve the irritation and correct acidity.

The common practice of putting permanganate of potash or bluestone in the drinking water when anything is wrong with the chickens cannot be too strongly condemned. Permanganate of potash loses its strength when it stands in solution and is only useful when used as an antiseptic wash. Bluestone is another name for blue vitriol, a very powerful drug and of doubtful nature. Unless we know exactly what a drug is used for it is far better not to use it. The simple remedies we would use for the family are equally safe for chickens. Let us not be beguiled into using this or that drug just because somebody recommends it.

I had meant to speak of chicken-pox and roup, but this article is already too long, and they must wait for another issue.

POULTRY AT THE STATE FAIR

JUDGE Robert V Moore remarked: "This is one great show of poultry, which has been made in the face of adverse circumstances." Two full cars of high quality poultry were detained south of the Tehachapi, which made actual exhibits come materially under the entries. Notwithstanding that, it was one of California's best mid-summer shows of the pure bred. There was a great showing of bantams, 74 coming from one Oregon breeder.

Of rabbits, both fur and meat varieties, over 200 exhibits were made Of pigeons there were 300, which is much larger than the exhibit of last year. Barred Plymouth Rocks astonished everyone by their number and quality. Of these there were 141 as against ten total exhibits of last year. On the other hand, White Leghorns made the poorest exhibit of themselves they have made at a state fair for many years. White Wyandottes made a remarkable showing, but as a class not as large as that of the Barred Rocks.

AMERICAN CLASS

Barred Plymouth Rock

Ck.—1, P. A. Bryant; 2, G. H. Otterman; 3, Geo. D. Lubben.
Hen—1 and 2, Geo. Schmitt; 3, Rosecroft Plymouth Rock Yards.

GERMOZONE The Best Pet Stock Remedy

For Poultry, Pigeons, Dogs, Cats, Rabbits, Parrots, Canary and other birds or pet animals, Germozone is a universal and safe remedy; for colds, snuffles, roup, sore throat, loss of voice or singing, influenza, bowel trouble, distemper, sore eyes or ears, canker, gleet, loss of fur or feathers, sores, wounds, skin disease,—or other affections of skin or mucous membrane.

"My hens have never done so well as this year and haven't lost a single chick"—Mrs. Flora Kapple, Walker, Ia. "Simply grand for rabbits"—L. W. Browning, Boone, Ia. "Cannot praise Germozone enough. I use it for chickens, stock and household"—Mrs. Wm. Hoeppel, Hugo, Okla. "My bird puppies don't know what distemper is and I never had such good success before with chicks"—Curly Smith, Kennett, Mo.

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c and $1.50 packages from Omaha. Book on treatment of diseases free with each package.

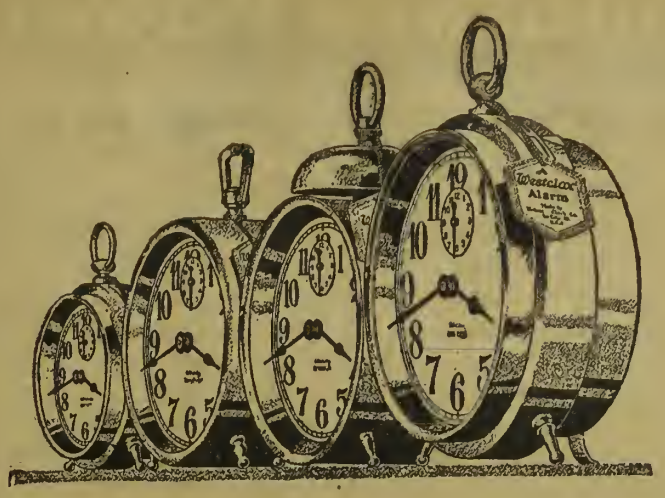
Poultry Queries

Conducted by J. A. Koethen

I want to set a 400 egg incubator the first of the month with the intention of getting some fries on the Christmas market. What is the best breed?—Subscriber, San Marcos.

Both the Plymouth Rock and the Wyandotte make quick-growing fryers, but to my mind there is nothing quite so tender and juicy nor so rapid in growth as the Orpington. See poultry ads and liners in Cultivator for names of breeders.



Westclox

WESTCLOX is a short way of saying Western clocks. It means a line of good alarm clocks made by the Western Clock Co.

The trade-mark, Westclox, is printed on the dial of every one: also on the orange-colored, six-sided tag attached to each clock. These marks of quality make it easy to choose a Westclox alarm.

There is a strong demand for Westclox. The present increased capacity is not great enough to supply it. Big Ben, Baby Ben, Sleep-Meter and America have more friends than they can serve.

Western Clock Co.,—makers of Westclox
La Salle and Peru, Ill., U. S. A.

When Time Counts

—when lost minutes mean lost dollars—many and many a man has learned to appreciate the real value of good tires.

An emergency—a quick trip to town and back!

That's when you want to be *sure* of your tires—sure they'll carry you there and back without trouble or delay.

United States Tires are noted for their dependability—the hundreds of *extra* miles they give—their unusually low cost per mile.

And there are United States Tires for every need of price or use. *Five distinct types in all.*

No matter what car you drive or what roads you travel, the nearest United States Tire Sales and Service Depot Dealer can supply you with the tires you ought to have to meet your individual needs.

United States Tires are Good Tires

THE SPIRIT OF THE 20TH CENTURY OVER LA BREA FIELD

Airplane photograph of the busiest spot in La Brea demonstration field. The aviation field and headquarters shown in upper left hand corner; below, on left of engraving, Arnold truck and auto display; circular tent in center foreground, A. F. George Company; the next, the eliptical shaped tent, Arnott; largest tent near center of engraving is general exhibition tent containing trucks, tractors, delivery trucks, pumps, oils and in fact the general exhibit of automotive power and accessories; small square tent at right of large tent, restaurant; next above it, National Automotive School; tent next above main exhibition tent, Hayman; circular tent adjoining, Bosbyshell; long tent, I. H. C.; circular tent, Fordson; other tents in upper right and autos indicate the main roadway along which tractor manufacturers maintained headquarters and demonstrated the use of almost every farm implement.

—the most remarkable reception ever accorded a new Tractor

The new California Orchard Model of the Allwork Kerosene Tractor, the

Allwork II

has performed so well that at this time

66 Allwork II Tractors Have Been Sold in California Since Its First Appearance, Sept. 9th

The Allwork II did all and more than was expected of it at the Tractor Demonstration. Its pulling power is phenomenal and while ordinarily the dynamometer pull for this size tractor can be found with an instrument registering up to 3,000 pounds—two such dynamometers were broken in testing the ALLwork II and the pull was registered with a dynamometer for registering up to 6,000 pounds. The ALLwork II pulled from 2,250 to 2,500 steadily on plowing speed and pulled over 3,500 pounds on low—enough to ordinarily handle a three-plow hitch. Nowhere can you find such a combination of good features for orchard work. The ALLwork II offers you the greatest pulling and operating value for the investment that can be found.

Some of the valuable features that made the Allwork II so adaptable to California conditions:

12 h. p. on drawbar
22 h. p. on belt
Individual rear wheel brakes
Rear axle differential

Only 4,000 lbs. weight
Only 55 inches high
Only 50 inches wide
Only 75-inch wheel base

Remarkably short turning
Burns kerosene or distillate
Three speeds forward and one reverse

Other Important Features:

The ALLwork II is equipped with special sand wheels haveing three rows of 6-inch pyramid lugs which give perfect traction in loose deep sandy soil.

Orchard models have the upper half of rear wheels entirely enclosed. It is all made to go under and around trees without breaking off limbs.

There are only 5 grease cups in the entire machine, three of which are on the motor.

The transmission, differential and worm drive are equipped with Timken bearings throughout. The jack shaft has Standard double thrust ball bearings and the rear axles are equipped with Hyatt roller bearings.

Differential in the jack shaft, and individual wheel brakes.

All gears are heat treated.

The ALLwork II has a five-bearing crankshaft.

It has three speeds forward and one reverse.

The same high grade material is used in this model that is used in the construction of the ALLwork 14-28 which has been so popular in the middle west the past six years.

ENGINE—Heavy duty, four-cylinder 4x6 kerosene motor. Develops 22 H. P. at the belt and 12 H. P. at the drawbar, running at 900 R. P. M.

FRAME—Is channel steel construction, reinforced with steel angles in all corners and hot riveted.

WHEELS—Rear wheels 42 inches in diameter, 10 inch face, equipped with 24 spade lugs 3 inches high. Optionals 36 inch wheels with lugs 6 inches high. Front wheels 28 inches in diameter, 4 inch tire with 1¼x⅝ inch steel band.

TRANSMISSION—Sliding gear, selective type.

GEARS—All gears, including bull gears and pinions, are of steel with cut teeth, and are hardened and heat treated for maximum service. Long life is assured by all gearing running in oil.

CLUTCH—Dry plate. Plates are lined with non-burning pressed asbestos fibre.

DIFFERENTIAL—Bevel gear type enclosed in dust proof case running in oil. Gears and pinions cut from forged blanks and case hardened.

CONTROL—Two levers, one operating the clutch, the other the speed changes.

STEERING—Tractor turns in eleven foot radius. Differential provided with double brakes to facilitate short turning.

It is Priced to be the Greatest of all Tractor Values

Dealers are finding the ALLwork II to be just the tractor the orchardists have long been wanting. It sells readily and is a service and satisfaction to the owners.

Orchardists who are looking for a tractor made especially for work in the citrus and deciduous districts of California will find in the ALLwork II many features not included in any tractor yet offered. Write for descriptive literature and any information desired.

Vol. LIII, No. 13 Los Angeles, September 27, 1919 One Dollar Yearly

Tractors Demonstrate Their Ability as a Farm Power

THE spirit of the 20th century was certainly covered over the Ranch La Brea during the great demonstration. This in strange contrast with some of the activities on this ranch during the past years. These activities have consisted of excavations into the great beds of asphaltum, out of which have been brought the skeletons of great mastodons, saber tooth tigers and other prehistoric animals which were drowned in the mirey pitch in the long ages before man walked on the earth. The beds from which the excavations were made were only a stone's throw from these modern day activities, which were demonstrations of the help to mankind which is being given through the power brought up from the lower depths of the earth from wells in these same brea beds. The products of the oil wells were developing power to turn over the earth's surface, then to pulverize and prepare for seed beds for wheat and other foods of man; to cut and grind feeds for animals; to prepare the orchard for irrigation; to bring the water to the earth's surface to apply to the crops; to generate electricity for lights; to turn the churn, washing machine and lighten other strenuous work of the farm home; "Gas" was even made to lift those who desired into the air and show them the kingdoms of the earth lying below. Over the entire busy scene during the week of the demonstration airplanes were hovering constantly. Ten dollars for a 10-minute ride was an inducement which got many of those who wanted to get a view in large of modern day farming.

Manager O'Neill said, "Yes, this is our greatest demonstration. It has been a busy week for every member of the association. Many sales have been made, and these to discriminating buyers. California farming will be advanced by this week's work." Not a single attendant drove to the demonstration behind Old Dobbin but there were thousands of automobiles parked in all portions of the grounds every day of the demonstration. Car service to Los Angeles was fine and many came who did not drive. As a rule it was not a city crowd but busy inquirers after information and of buyers. The arrangements were by far the best which have ever been made for these demonstrations. Hot dog stands and restaurants both gave service which was satisfactory. Every exhibitor provided his guests with bottled water, and chairs and lounging places were in almost every tent. And every tractor dealer had his own tent for exhibit and for headquarters purposes.

There was dust aplenty but that is what a tractor demonstration is for. It raises the dust. One striking feature was a view given to those in the airplanes, on the first day or two at least, of the demonstration. A portion of the field was the stubble of barley field. The tractors with a gang of plows had been used to write their own names on these great fields. These names had been written in letters covering acres, and one might almost get lost wandering around in the letter O for instance.

* * *

DEMONSTRATION NOTES

The mammoth tent filled with tractor, truck, auto and implement accessories was one of the most instructive points in the demonstration. There were trucks, trailers, storage batteries, piston rings, greases, oils and fuels without stint; electric lighting systems; oil stove burners; mammoth pumping plants; magnetos; carburetors; seeds and plants; tire cement; self starters; many kinds of tires; wood sawing demonstration; fire extinguishers; even washing machines and other household labor savers.

A novelty was an automatic ridger and blocker. The ridger was very similar to the ordinary one which has been used for years in California or-

Continued on Page 407.

SOME TRACTOR DEMONSTRATION PHOTOS AND BIG TENT VIEWS.

Upper row of photos: At left, a group of the house of Arnott. From left to right: Willard Arnott, president; M. D. Schatzman, Los Angeles; A. H. Leimbrook, sales manager; A. S. Marlow, Western district manager; A. P. McKay, manager experiments with Towers & Sullivan Manufacturing Co., Rome, Georgia, manufacturers the McKay Power Lift Disk Plow with subsoiler attachment.—Center of top row of pictures shows scene in tent of B. Hayman and Company.—Upper right corner, some of the big ones of the International. Those standing, from left to right are: H. E. Daniels, branch manager, Los Angeles; W. G. Creswell, branch manager, San Francisco; Harry E. Price, assistant branch manager, Los Angeles; W. E. Price, blockman, San Francisco Branch; W. D. Zarley, blockman, Los Angeles Branch; Robert Stewart, district manager, motor truck department, Chicago; C. E. Creitz, blockman, Los Angeles Branch; Charles P. Hawkins, advertising manager, Los Angeles Branch.

Center Row:—Bosch magnetos spoke for themselves. Courteous attendants were there to make fullest explanation of their merits. The Coast manager of this big concern is Paul Furrier of San Francisco. The gentleman at the desk is H. B. Weaver.—Westrohack and Aggeler & Musser people, next door neighbors, demonstrated values secured by combining high quality seeds and legume inoculating cultures.— The next scene is that of the Germain Seed Company with exhibit of seeds, plants, nursery stock, spraying material, in fact everything of interest to gardener, orchardist or truck farmer.

Lower Row:—Left, shows one exhibit in Arnott tent. It is that of the McKay disk plow declared by one to be the sensation of the demonstration.—The next scene to the right is that of the Dreadnaught gas burner, exhibited by Scientific Specialties Company, Los Angeles. Albert E. Oiler in charge. Fuels of comparatively low grade are used for heating and lighting.—Look carefully at the big boulder suspended by big chains in the lower right hand picture. On it appears the characters 285. This indicates the number of pounds the boulder weighs. It is suspended by a narrow strip cut from the inner tube of a Norwalk tire. Must be rubber. Lichtenberger-Ferguson Co. of Los Angeles made this exhibit.

Agricultural News Notes of the Pacific Coast

Northern California

Glenn County had a fine exhibit of rice at the State Fair.

Yolo County had a State Fair exhibit of 92 kinds of grain.

Butte County is taking a census of fruit bearing trees in its territory.

The first Duroc-Jersey promotion sale will be held at Davis January 14.

One island near Stockton has 7000 acres in onions, 200 to 300 sacks per acre.

Some Chico cattlemen are vaccinating against blackleg, a few local cases being found.

Car shortage has resulted in but 25 cent cent grape shipments from several districts.

The El Dorado farm bureau will hold a picnic and fair at Placerville October 23-25.

The Indian Flat farm center of Nevada County has purchased a high class Durham bull.

Wyandotte farmers have made a live stock and seed survey and will exchange news of their needs.

Humboldt County made its chief horticultural exhibit at the State Fair in apples, a splendid display.

Esparto, in Yolo County, is a big tobacco growing center and had a big exhibit at the State Fair.

Cover crops was the subject at the last meeting of the Barry, Sutter County, farm bureau.

Harvesting of the Butte County fig crop started last week with an average price of 15 cents.

A large acreage of tomatoes around Oroville is commencing to move toward the city cannery.

Five agricultural clubs have been formed in Yuba County schools and more will be organized.

Gridley, Butte County, schools report a remarkable showing in cotton growing by a school club.

Northern California sheep men have sent big consignments of animals to the Salt Lake live stock sale.

Farm centers in the eastern part of Shasta County will hold a picnic and fair at McArthur, October 2-4.

State organizers are at work forming farm home improvement clubs in Sacramento County and others adjoining.

Professor Miller of Texas says the sheep exhibit at the State Fair showed the finest animals ever seen in California.

At Chico the supervisors will reconsider the truck ordinance and allow heavier loads on highways and bridges.

"Almond Fair, Arbuckle, October 3-4" was scattered all over the state fair grounds, the announcement printed on ribbons.

Two Woodland, Yolo County, farmers have just purchased $80,000 worth of sheep, 6000 being the number in the lot.

The potato tuber moth has been completely exterminated in the Colma district, so says District Inspector Rhodes.

The average potato yield of San Joaquin County is 80 sacks to the acre, some fields showing twice that amount.

Approximately 7,000 persons are engaged in picking hops in the Sacramento Valley, the wages being $5 and $6 a day.

Central California

Watsonville reports 50 cars of apples leave there each day.

The Lodi district sent out 93 cars of Tokay grapes on September 12.

Dos Palos reports loose alfalfa selling for $25 a ton and baled at $28.

At the Hanford fair 42 hogs brought $7,402.50, an average of $176.25 each.

The Pajaro Valley has shipped a total of 4,000,000 boxes of apples this season.

A sale of thoroughbred live stock will be held at the Riverside Fair, October 7-11.

The Lodi district reports this season's almond crop both large and of fine quality.

A merger has been completed of twelve cooperative creameries in the Fresno district.

Merced, San Joaquin and Stanislaus Counties have agreed on uniform rates for cow testing.

One grower at Los Banos has 800 acres of rice from which the expectancy is 30,000 bags.

The top price paid for hogs at the MacFarland, Kings County, sale last week was $16.50.

One vineyard of Sultanas near Orosi has yielded 70 tons of raisins from twenty-eight acres.

$17,500 in cash prizes will be awarded at the Fresno County fair which opens September 30.

A Lindsay grower reports eight tons of Manzanilla olives on three acres of eight year old trees.

The total amount paid to producers by the creameries of Kings County in 30 days was $325,000.

A government forecast of Tulare County's orange crop for 1919-20 season is 2,000,000 boxes.

The Sweet Potato Marketing Association has been organized in Stanislaus County with 200 members.

More than 6,000 persons attended the twelfth annual Escondido Grape Day Festival on September 12.

Nearly every car of Tokays from Lodi district has gone well over the $2000 mark in Eastern markets.

Two thousand acres of cotton will be harvested in Kern County this year and picking is now under way.

Because of a lack of cans the Visalia cannery was forced to close and ship all contracted fruit to Oakland.

The Karakul Sheep Company of Kerman has just shipped some thoroughbreds to Venezuela, South America.

Los Banos is "coming back" from the recent fire; two bank buildings, a hotel, and a garage will go up at once.

J. D. Norton of Mountain View says he will clean up $10,000 from ten acres of broom corn. The corn is now 14 feet high.

The Porterville cannery will be at once doubled in capacity, making it the largest of its kind in the San Joaquin Valley.

On October 2 the Madera Union High School district will vote on $100,000 bonds for improvement of buildings and equipment.

Kings County is to have a "Pork Day" at Hanford, October 15, when fat hogs will be received, judged, prizes awarded and the hogs then offered for sale.

Southern California

Anaheim will hold a carnival Oct. 4.

Baled bean hay at Oxnard is bringing $14 a ton.

Orange County claims one-half of the sugar output for 1919.

The peach growers about Pomona were paid a total of $275,000 this season.

Bishop is to have a new enterprise by the name of Virden Packing Company.

Bishop has no empty houses and the call for them is strong, almost daily.

Huntington Beach will hold a fair October 2-4, for Orange County officially.

A New York firm has purchased the thousand-acre Mission Vineyards at Ontario.

The 1919 cotton crop of Southern California is estimated at a value of $43,360,000.

More than 500 cotton pickers are in camp about Blythe, some all the way from Texas.

Imperial Valley carried its $2,500,000 water bonds last week by a three to one vote.

A rancher near Blythe was arrested last week for allowing Johnson grass to go to seed.

The Hemet Orange Growers' Association will hold their annual meeting September 27.

Mrs. Ethel Travis of Hement earned $10.08 working a 12 hour day in the local cannery.

Los Angeles will have a new oleo factory, built by Morris & Co., to employ 250 people.

One hundred and fifteen building permits were issued in Fullerton January to August.

A new bank has been started at Fullerton, known as the Standard Bank of Orange County.

It is said that undersized peaches are being shipped into Mexico for the manufacture of brandy.

Pomona reports five inch Phillips Cling peaches, the largest ever coming into the local packing houses.

A newly-patented date shredder which seeds and saves the cull dates has just been installed at Indio.

Brawley has completed a ten acre landing field for airplanes and the outlook for this season's crop is good.

California now leads the United States in seed protection, the bulk from central and southern counties.

The total receipts by the members of the San Dimas Fruit Exchange will be $1,250,000 over last year's figures.

The new date packing house at Coachella is completed and will open for the receiving of date on September 22.

Alamitos Bay is protesting against allowing the Alamitos sugar factory to have an outfall drain pipe to the sea.

Hemet announces that more packing space and additional canning facilities must be had for another year's crop.

The date harvest in Coachella Valley is in full swing except for the Deglet Noor which will not be ripe before October.

Oxnard reports lima beans coming in to the warehouses quite rapidly. Twelve cents is the price offered, with no sales as yet.

The Coast and General

The Pacific Coast is facing a sugar famine, especially of cane sugar.

Arizona reports a bad drop of prunes late in August.

When sold in Indiana apples must weigh 60 pounds to the bushel.

Texas is seeking to secure a permanent live stock building at the California state fair grounds.

The world's production of rice is nearly as great as the production of wheat.

There will be no lowering of meat prices in the near future, so say Chicago packers.

Washington potato growers will ship heavily of late table potatoes to California.

Central Oregon reports a 30 per cent increase in potato acreage over last year.

A cannery at Myrtle Point and one at Coquille, in Oregon, are being built to care for the berry crop alone.

Clarke County, Washington, is just starting to pick a 65 per cent maximum prune crop.

Tillamook, Oregon, has 25 cheese factories which last year produced 5,036,612 pounds of cheese.

Oregon reports that every dollar expended for sulphur on alfalfa lands has returned a profit of $20.

Twenty-five hundred dollars was offered for a ram at the Salt Lake sale, and refused.

Ninety-eight Australian farm students have arrived at Davis for a year's agricultural course.

The Western Berkshire Congress want a bond issue of $1,000,000 to improve the state fair grounds.

The State Fair's tractor exhibit was by far the largest ever seen in the state; many new machines were shown.

The Arizona 1919 state fair offers $20,000 in cash prizes. Floriculture and needlework made special departments this year.

The bureau of crop estimates give out the figures 23.072,000 barrels as the 1919 apple crop, compared with 24,724,000 for last year.

The Prince of Wales recently bought 50,000 bushels of wheat at the Winnipeg Board of Trade and sold at same price, just for experience.

Growers of prunes near Dallas, Oregon, are erecting their own drying plants. Heretofore they shipped to city dryers.

The Prescott, Arizona, fair will be held Oct. 16-18. Household economy will come in for more than its usual amount of attention and prize money.

The Whatcom County, Washington Dairyman's Association has decided to build a utility plant in Bellingham or Lynden, for it now has 922 members with 7804 cows.

Dr. Yelimir Stoykovitch, from department of agriculture of the Serbs, Croates and Slovenes, is investigating the methods of organization and operation of the new state department of agriculture.

Dr. R. H. Forbes, former dean of the Arizona college of agriculture, is now in Egypt studying agricultural conditions. He writes that he has introduced a number of varieties of wheat and legumes common to the Southwest, into Egypt, with quite satisfactory results for the first season

Bunk---An Editorial

By R. P. Royce

THERE seems to be no let up in the effort to disrupt the Milk Producers' Association. No sooner is one fight won by the producers than a new legal battle looms. Within the last ten days four complaints have been filed with attorney-general U. S. Webb by John W. Preston, former United States district attorney, acting for Mrs. M. M. Webster, charman of Northern division of the Federated Women's Clubs of California, Geo. N. Renner of Stockton, R. Holcomb of Fresno and S. M. Bailey, a former member of the Imperial Valley Milk Producers' Association, against the California Milk Producers' Association, the Northern California Milk Producers' Association, the Imperial Valley Milk Producers' Association and the San Joaquin Valley Milk Producers' Association. In the complaint it is asserted that the associations were organized as non-profit cooperative organizations but that in fact they operate as corporations organized for profit.

The press stories sent out last week by Preston claim that the California law permits the organization of non-profit cooperative corporations but specifically states that "No such non-profit corporation shall have capital stock nor shall it be carried on for profit."

Preston further says:

"The law excludes such corporations from the supervision of the State Corporation Commissioner, because it was never contemplated that any of them would attempt to unload bond issues on the public. The Milk Producers' Association has created one bond indebtedness of $180,000 and another of $90,000, which it is attempting to unload on the public through solicitors and agents."

According to the San Francisco Chronicle:

"The purpose of the suits now filed is to secure in the courts of San Joaquin, Alameda and Imperial counties a decision as to the right of promoters to control the output and sale of an essential food product by the organization of an association of such food producers as an ostensibly non-profit association, and then making large issues of stock for public sale.

"The suits now brought," said Preston, "go to the root of the question as to whether a crowd of bankers or others shall be permitted to organize corporations ostensibly not for profit but which are, in fact, organized strictly for profit."

If such be the case, it strikes us that every co-operative association in California is vitally interested in the outcome of the suits now filed. If, as stated, these suits are to determine the right of promoters (producers) to contract the output and sale of an essential food product by the organization of such food producers," it would appear that the result may be far reaching and affect the existing organizations. If the suits filed against the milk producers are in fact an effort to break down co-operative effort they should serve as a call to arms to all producers.

The Cultivator makes no pretense of being versed in the legal aspects of the case. But this we do know and believe: We believe in co-operative effort. We believe that all producers should have the fundamental right to organize to conduct their business and we know that if the present law does not permit such organization, then a law is needed that will.

The point raised in the suits filed, that the milk producers are organized for profit does not occur to us as startling. It has been our idea that each and every existing organization of similar nature was primarily organized for profit. Certainly we fail to see the need for organizing for any other reason. Increased profits through better marketing and stabilizing the industry is the backbone of all organizations.

The charge is made that the milk producers have built and are building plants throughout the state to manufacture and handle by-products. That it is the purpose of the organization to gain control of the dairy industry of California and thereby be in a position to set an arbitrary price—and usually the suggestion is made that the price will be exhorbitant to the consumer.

Apparently one of the favorite means for attracting the attention and sympathy of the public, and at the same time create dissatisfaction among the producers, is to not fail to omit the statement that the head of the state association is a banker—James Henderson, Jr., of Sacramento, and to refer to the association as "Henderson's Milk Trust." At times it is difficult to determine whether the real fight is directed against Henderson or the producers—but back of all, our readers can be assured, the fight is not on Henderson—any other man occupying the same position would come in for the same line of attack—and it is a real effort to break down co-operative enterprise. It makes no difference under what false colors the fight is waged. The instigators know the real issue involved.

Is there any real reason why milk producers should not own their own plants and manufacturing establishments for effectively handling their products, when other co-operative organizations own warehouses, shipping stations, grading machinery, etc.?

Is there any sound reason why dairymen should not attempt to control sufficient of their own product to be in a position to force a living price for their product, when nothing is more certain than if they were not in control of their product that they would be helpless at the hands of distributors?

Does the public suppose for a moment that the dairymen are not aware that the immutable law of supply and demand will always govern the prices for their products? And does the public not know that all the dairymen ask is a reasonable profit for their investment and labor?

Who would profit most if the milk producers' organizations were disrupted? The public? Hardly. The public would still buy milk and milk products and the distributors, who by no stretch of the imagination can be considered philanthropists, would exact from the public all that the traffic would bear.

Suppose that the organizations were put out of business and the producer placed at the mercy of the distributor—the prices paid producers would eventually get to a basis of cost plus a reasonable profit, else the dairymen would go out of business, thereby lessening the supply in the face of increased demand which would inevitably result in higher prices. Surely those "public spirited" persons who have lent their names and efforts to the fight against the producers are not looking far ahead. If neither the producer nor the consumer would profit by a disorganization of the association, who would? Only three parties are involved, the producer, the distributor and the consumer. Do not the above facts suggest the basis for the present fight?

Some factor will control the price of milk and milk products to the high point of supply and demand. Such being the fact, which would the public prefer—the producer or the distributor?

A series of circumstances surround any industry wherein the situation demands a change if the industry is to live, some sort of movement makes a start and, if sound in principle, grows. The various milk producers' associations were born of necessity and that necessity was the need of hinging about some sort of arrangement whereby the individual dairyman could be assured of a reasonable price for his product. In other words, the dairyman reached the point that the citrus grower, the prune, walnut and other growers reached and solved.

The public should be made to understand the real relation the associations bear to the consumer.

Continued on Page 418.

Tractors and Tractor Boosters

At the top, an Ailwork tractor attached to Oliver. The crowd about are branch and district officers of the Electric Wheel Company and boosters for the tractor.

Twin City is capable of handling some remarkably rough and hard soil conditions. In the photograph are also shown district and state managers.

The Cleveland can handle a big bunch of disks or a disk plow. The third photo from the top shows two of them just off the field after some heavy work. In the background are shown Los Angeles and district managers.

A couple of Heiders. The rear one of the two shows three mold board plows raised as if for travel from field to field. The smaller type is just starting away with disk harrow.

The little Beeman, or should we say big Beeman when it comes to performance, was demonstrated every hour and every day of the exhibit. Its method of guiding is so simple that a little experience is sufficient that a boy in his teens may easily operate.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

A birdseye view of a part of the ground of the Southern California Tractor Demonstration is given on the cover page. Such a view of such an event is an indication that we are living an age when things are different.

A GREAT DEMONSTRATION

The crowd was not as big as might be desired but the attendance of farmers with an eye to business was good. The buying was liberal and many sales were made of tractors to be taken direct from the demonstration to the barn. In other words, the demonstration of the Southern California Tractor and Implement Dealers' Association was a success. As to some of the scenes on the exhibition grounds, photos in this issue give quicker information than can be given on this page.

PORK OR GAS

Hogs are high. We recently heard of a man who apparently started out to help maintain their prices. He lived near Chicago where he was able to secure around $22 at that particular moment. It cost too much money to buy a truck to haul them in, so he drove them on foot. Result: 12 of the biggest and fattest died from heat and exercise. The 12 averaged 400 pounds. Net loss: over $1000.

It costs more than $1000 to buy a truck but at the same time it would have made a big start on one of the best make of trucks and be big interest for one year on the highest priced truck ever made.

FARM BEAUTY AN ASSET

A farm purchaser once remarked that he paid $5,000 more for his eighty acres because it had fine roadside trees on two sides. Asked why it was worth more he said it looked as though somebody owned it, and further stated that these trees, with those about the buildings made it the most beautiful place for many miles around. If this be true, how much the average rancher has to gain in land values! Consider bare ranch buildings compared with the same a year or two later, when blue gums have enclosed the area and a few vines clamber over buildings. One need not look twice to see that every dollar expended has added a hundred dollars in value to the ranch.

WHEN THE COWS COME HOME

We used to say when future prosperity was hoped for that comforts and luxuries might not be ours now, but when our ship comes in we will have all of comforts and give to our friends in abundance. For many of us the ship does not appear above the horizon as early in our life as we could wish. We are sure it is laden with gold and richest of fabrics which will increase our comforts. The ocean is wide and the little breezes seem hardly sufficient to fill the sails of the wonder ship. Many a Californian has tired of waiting for the ship and has established a dairy, and instead of "when our ship comes in" he now says "when our cows come home."

And the cows are coming home to California for dairying is increasing notwithstanding the bitter attacks which are intended to lessen dairy efficiency and fullest returns to the dairy owner.

THROWN CIGARETTES?

Southern California's sun is shining blood red through a layer of smoke and ashes fill the atmosphere. Pacoima and San Gabriel Canyons and even as we go to press, Arroyo Seco is a swirling mass of fire. The mountain sides and many a productive little valley have been changed from prosperous homes and beautiful summer resort home sites to desolation and ruin. Hundreds of square miles are being burned in spite of strenuous efforts of forest supervisors and rangers, aided by a small army of fire fighters. Housewives in Los Angeles, more than 25 miles away, find clothing on the lines smeared with ashes and soot from these fires. At street corners, where an eddy is formed around the curbing, little piles of ashes are made, and with it all suffocating heat is prevailing. The loss is appalling though not so immediately apparent as where merchandise filled buildings go up in smoke. But the loss is more real and will take a far greater number of years to restore. Irrigators of the San Fernando and San Gabriel Valleys will suffer for many years to come. As we go to press there is no promise of any early control of the fire.

This is the worst fire which has visited California forests for many years. But it is mentioned as an example of many a fire which, if not so disastrous, has been a cause of loss of California's productive power and even greater loss of beauty. And California beauty is a commercial asset. Only this week the great California Redwood Park near San Jose has been the scene of the disastrous conflagration and giant redwoods, thousands of years old, have been felled.

And all because of a bit of carelessness on the part of some one human.

STATE LANDS

Surveyor General W. S. Kingsbury will hold three public auction sales of state school lands unsuitable for cultivation during the month of October, 1919, in San Bernardino, Riverside and San Diego Counties.

The above item is mentioned in order to call attention to one word and that is "unsuitable." The Cultivator has been asked by farmers as to when these lands would be sold and we take it from the above announcement which is from the state surveyor's office, the lands are only suitable for mineral or oil development purposes. Any one who wishes fuller information should write W. S. Kingsbury, Surveyor, Sacramento.

GRAPHIC

We have been so busy up to the last moment of going to press that we haven't had time to count the number of illustrations which appear in this issue of the Cultivator. We are not even guessing at the number but we may be permitted to call attention to them as showing some of the work which confronts the modern day farm paper. Practically every illustration was taken with the Cultivator camera, and in fact those appearing in the paper are only those which have been left after discarding a far greater number which were taken by the Cultivator staff. In the rush and dust of such a demonstration it is very hard to get illustrations which will always answer for engraving. Hence a great number must be taken for selection. Some of the most interesting pictures are among those discards and we regret we have not room for them all. Really the greatness of a show is shown more by these illustrations than by any comment we may make.

(At the last moment the foreman says "Impossible to get in illustrations of seven of the tractor views. Will use them next week.")

NEW PROFESSION

Dr. Ford A. Carpenter was a pioneer in the service of the United States weather bureau. He has been with that service since its beginning and for several years has been in charge of the stations at San Diego and at Los Angeles. He has now retired from that service and is working with the Los Angeles branch of the service will be succeeded by Col. Hersey, who is also a man of long experience in weather bureau service who comes to Los Angeles from Milwaukee.

Dr. Carpenter will now begin pioneering in another service. He will enter the profession of consulting meteorologist and will make climatic investigations for intensive agricultural development. He will give attention to water resources and other matters pertaining to the application of weather science. He will be in charge of the department of meteorology and aeronautics of the Los Angeles Chamber of Commerce and has been elected lecturer in meteorology of the Southern branch of the University of California.

Naturally Dr. Carpenter's work is of that nature that it appeals to the larger landed estates or to counties or communities which wish information giving greatest control over labor operations which are influenced by meteorological conditions.

We believe there is a field for Dr. Carpenter's activities and will watch for developments in this the latest and newest in the agricultural world.

ANOTHER STRIKE

And now miners in Northern Ohio are striking for a six hour day, five days in the week, and 60 per cent advance in wages.

What's the use of working at all? Let's all strike and let the government support us.

BETTERING AGRICULTURE

Secretary Van Pelt writes regarding the Riverside Fair that a combination of public sale of pure bred stock and exhibition of pure bred and high quality products from Southern California farms is proving intensely interesting to the farmers of the South. More and more we are realizing the power for the good of agriculture for the farmer in the agricultural fair.

HEALTH IN CITRUS

The returns from the citrus industry have been increasing year by year, and at one time it was predicted that some day the citrus industry would become so great that fifty millions of dollars would be returned to the state because of it. But the past twelve months have given a crop which has brought prices that are above average, and this year alone it has been estimated, there will come to the state because of this crop in excess of seventy-five million dollars.

This crop has been grown on lands which at one time were in a class which would produce "nothing more profitable than horned toads and climate."

SELLING THE FARM

The Middlewest is having a land 'boom", especially the corn belt section. It has caused the formation of certain companies which were "buying" largely of real estate. Here is one instance given by the department of agriculture which is extending warning to farmers who may be inclined to be "easy".

"It is desirable to call attention to certain speculative practices now being employed which are entirely unfair in character. Certain corporations have been formed with limited liability for the purpose of enabling the promoters of those corporations to speculate in farm land in the name of the corporation without incurring personal liability for their purchases A still more reprehensible practice is being followed. Certain shrewd persons are purchasing land in the name of some "dummy" who is personally not good for the obligation The dummy subsequently resells the land to the actual speculator, though still retaining the liability. in case the speculator fails to resell. the dummy will be unable to fulfill the obligation. At best the farm will revert to the former seller, who may have lost the opportunity to make an advantageous bona fide sale.'

We have not heard of many operations along this line in California but knowing California characteristics it is entirely proper to pass the word along that we may be a bit careful as to who we "sell' to. We recently heard of the "sale' of a place for $9000, $25 down for a period of 30 days. The sale of course was never completed for the gamble on the $25 was called by financial conditions which would not permit a resale and a cleaning up of a few hundred dollars on the original investment of the $25.

DEMONSTRATE ABILITY

Continued from Page 403.

chards with an attachment, or rather two attachments, with two scrapers with trip dump or release. The release was connected with the tractor and operated by the toe of the tractor driver. It left the basin ready to be filled from the irrigation ditch.

One tractor, present only in model, is called a Hingeless tractor. This was placed on a pedestal and not in operation.

Kent Knowlton, formerly horticultural commissioner of Kern County, just back from the trenches, gave the demonsration the once over. He is to return to his former work.

Several of the tractors were equipped with gauges or measurers of draw bar power. By observing these the careful buyer could determine the exact draw bar power of each tractor. Figures determined by this means indicate actual performance rather than theoretical horse power.

the current in propelling sewing machine, washers, electric fans and other light household machinery.

"Demonstration" was not left entirely to tractors and farm implements. The preparation of the seed bed is important, the selection of the seed is equally so. The Germain Seed Company had a fine and attractive exhibit.

The R. M. Wade Company had the gasoline operated drag saw in operation. This is a light weight saw which will prove a labor saver on almost every ranch. It is comparatively inexpensive and beats hiring a husky at present day labor prices.

The Bosch Magnetos gave opportnity to many a tractor and truck owner to inform himself as to its methods of work and as to its efficiency. It was working in moisture saturated atmosphere; it was even working submerged—certainly a thoroughgoing test.

The great number of exhibits and

Sampson, strong as its name, General Motors Company, H. L. Marsh, Los Angeles manager standing with foot on draw bar.

For cotton, corn and other field crops, one of the newer Avery introductions, Manager Rainey of the Los Angeles office on the seat.

Yuba Ball Tread in various sizes demonstrated ability to handle varied problems. This is a 12-20 on a gang of disks.

The Moline Universal 9-18 hitched to Moline double disk and showing ease with which it demonstrates one man method.

Wallis tractor handled by Douglas Boswell Co., Los Angeles and San Francisco. Standing left to right, Douglas Boswell; Bruce Mitchell, Southern California manager; S. J. Clapper, president Toro Motor Cultivator Company, Minneapolis.

The big Killefer subsoiler with Mr. Hudson of the Los Angeles office standing on beam. The Killefers make tools which stand the gaff.

The LaCrosse, handied by Knapp Tractor and Implement Company, Los Angeles, Mr. Williamson on seat, Mr. Knapp standing.

The mowing machine was there. Tractor operated? Sure! And good for 20 acres per day.

Manager O'Neill is some tractor "fan" himself. He recently purchased a thoroughly dependable machine with full equipment for general farming and will soon be looking at the tractor game from the producer's standpoint. We regret exceedingly that the illustration, intended to show our readers the face of Manager O'Neill, proved defective.

The Delco Light folks make an exceptionally attractive exhibit showing the cleanliness, efficiency, and even economy of electricity in the farm home. The installation of their plant is now possible at a small expenditure and there is not only possibility for light and heat but for using the novel methods of calling attention to efficiency of the various greases and oils was educational and very valuable in proving the necessity of giving closest attention of lubrication of farm machinery.

Fire Extinguishers! Yes, they should be on every farm and every fair and exhibition these days gives opportunity to be informed as to their value.

Probably the most striking exhibit in the great exhibition tent was the monster 50 horse power semi-Diesel engine propelling the great centrifugal pump wih capacity of 150 inches on a 60 foot lift. It must have cost a great sum to make the installation of this pumping plant but it compelled attention on the part of every visitor.

Self-Sterile Plums

We recently submitted a question to Prof. J. C. Whitten of the University, as to pollenizing of various varieties of plums through planting of different kinds in one block. Prof. Whitten writes:

"In recent years this division has been carrying on experiments to determine what plums are self-fertile and therefore capable of bearing fruit when planted alone in solid blocks, and what plums are self-sterile or capable of bearing fruit only when another variety is planted adjacent to furnish the pollen for the fertilization of their flowers. Mr. Hendrickson of this division has now a bulletin in press giving the results of this work. The bulletin will soon be ready for distribution.

"All of the Japanese plums worked upon, except Climax were found to be self-sterile or nearly so. The Satsuma and Kelsey were found to be absolutely self-sterile every year. In no case have we found the Satsuma capable of setting fruit unless its flowers were pollenized with the flower of some other Japanese variety. The Kelsey was not capable of fertilizing it adequately. Any of the other Japanese varieties were capable of fertilizing it fairly well. Climax and Burbank gave the best results as cross-pollinators for the Satsumas.

"I would suggest that every fourth or fifth row of Satsumas in the orchard in question be top grafted next spring with either Climax or Burbank, the two varieties found to pollinate it most effectively. Climax is apparently slightly preferable. I think I should use it provided you find it otherwise a good plum suited to commercial uses in your district. If, however, the Burbank is a better commercial plum for the neighborhood, I would use it in place of the Climax.

"The Wickson plum fertilizes the Satsuma very well and should it happen to he the best commercial Jap ese plum, you could use it also to vantage to fertilize the Satsuma.

"We find that a row grafted in a pollinator can fertilize thoroughly least two rows of trees on either si so if every fifth row is top worked t intervening four rows should set fr well. This corresponds to the logi suggestion in your letter of top wo ing in order to furnish a good poll izer instead of driving nails in t tree.

"I understand that the Satsu plum is coming rapidly into favor a that not enough of them are produc in the state to fill the special dema for this variety. This is largely d to the fact, no doubt, that the Sat ma has proved self-sterile and the fore not a good bearer unless it ha pened to be grown adjacent to a v riety which will fertilize it. In vie of these facts, I would advise again uprooting the Satsuma plums, as feel sure the orchard could be ma profitable if a good pollinating varie is introduced into the orchard by t working.

"Where no pruning has been do for two years, the trees will no dou have a good many limbs which soo will begin to shade out the fruitin twigs below. I would advise prunin this winter by a judicious thinning o of the main limbs. They ought to t thinned out sufficiently that side fru ing branches can form and be mai tained all up and down these ma limbs in subsequent years. Growe who cease the heading back proce and adopt the long pruning syste often at first fail to thin out adequat ly. This often results in the tre setting an overload of fruit the fir year or two and in such an abunda branching system as to shade o fruiting wood low down on the ma limbs. This disadvantage can be pr vented by adequate winter thinnin out of branches."

Soil Blasting and Tile Draining

A great many of our California river valleys and coast sections which require underdraining have soil of the clay type, which drains slower than any other. The lines of tile must be placed deep and close together, for the height of standing water in the ground rises steeply away from each drain and comes to the surface but a short distance from it. In the stickiest soils it is not unusual to find a pipe line four feet under the surface drawing water from only about 25 feet to each side, while in more porous ground the filter level sometimes extends out 250 feet or more from the drain.

On all land which must be tile drained, it pays to assist this percolating of the water to the drain pipes by loosening the ground through proper blasting. By breaking up a heavy clay by means of explosives to a depth of four feet, drains can be laid every 200 feet, with entire success, where without the breaking they might have to be laid every 50 feet.

The depth of the level of standing water in the soil of course must govern the depth of the tile, yet if the ground is properly loosened, the tile may be placed considerably nearer the surface. For instance, if on a heavy clay the water table comes to the surface at a distance of 40 feet from a drain placed four feet down, the grade demanded by water in the soil is one foot fall in ten of distance.

Supposing it is necessary to kee the water table two feet below th surface for the crops grown, it the becomes necessary to have lines c dains no more than 40 feet apart. Bu if the same soil be loosened properl and given a due supply of organic ma ter in the form of roots of crops, th grade demanded will be more like tha required in open sandy soil, or on foot in 30 or 50, which would permi the drains to be 60 to 100 feet apar at least, while still keeping the wate table two feet below the surface.

The blasting serves other useful pur poses, besides assisting the drainag and to accomplish it not nearly s much labor is required as in placin the drains it displaces, which shoul he a big factor this year and for s v eral years to come.

The method of doing the work i that of ordinary subsoil blasting, us ing charges at the depth required, bu no heavier than will break the groun to the surface without blowing out cra ters. The distance between charg should be no greater than will insure the breaking up of all the ground There should be no harrier of unbrok en ground between them. For th ditches where the tile is to be laid it is not wise to excavate with ex plosives, because the dirt is sprea widely and beyond recovery. What can be done to advantage is the loo ening of hard ground to make the shoveling easier and quicker. This looscning requires blasting similar to subsoiling, though the charges ofto may be placed somewhat closer to gether on the line, and be slightly larger.

A Maxwell Truck you buy this Month will make you a present of its Total Cost in One Year.

More miles per gallon
More miles on tires

FIVE-thousand-dollar truck construction. Five-thousand-dollar truck guarantee. Worm Drive. 10-foot loading space. Electric lights and generator. 2400 pounds—we built it right to get it light—to save tires—to reduce gas consumption—to climb hills—to take bad roads—*and to keep repair bills down.*

For long hauls and short calls. Self-supporting. Amateur proof. Chassis $1185 f. o. b. Detroit.

If you like, take your time with the payments and let the Maxwell buy itself on the run.

Pays its way from day to day.

THIS IS THE DISC

The One that Delivers the Service under all California Soil Conditions.

The New Improved Davenport Doubleduty Disc is the last word in Disc construction for California Conditions.

The Davenport Doubleduty Disc rides through any soil condition like a battleship under full steam. It is built to work the soil the way you want it worked. Entire frame is of angle steel excepting braces. No sturdier construction was ever offered. Made for both horse or tractor in 6, 8 and 10 ft. sizes. A postcard inquiry will bring an illustrated circular.

LA CROSSE TRACTORS---IMPLEMENTS

Knapp Tractor and Machinery Co.

416 Central Building . . . . Los Angeles, Calif.

Continued from Page 407.

The Westroback people came down from San Francisco with an exhibit which gave to many a cover crop specialist, and to every planter of seeds in fact, an inspiration as to help that may be had in farm operations from the tiny unseen, almost unknowable, bacteria. The Aggeler & Musser people are Southern California distributors.

The Bean tractor people had their little Trackpull zig-zagging orchard trees planted for the occasion. This is a regular operation which the Bean people have pulled off at many a tractor demonstration and it is a convincing one for many an orchardist.

The Wallis tractor handled by Douglas Boswell Company at San Francisco and Los Angeles, demonstrated the ease with which intractable soil may be handled where sufficient power is attached to modern day farm implements.

The 12-25 Union Sure-Grip tractor made at Torrance, made its first appearance at the tractor demonstration of 1918. It gave promise of being true to name but the present day model proves that its grip is sure.

The Holt exhibit was over the top on the other side of the trenches, but the majestic 75s handling 16 bottoms and other sizes making a most complete exhibit, succeeded in drawing a crowd. One of the newest exhibits of the concern this year was that of a monster land leveler with belt driven dumping device.

Robert Killefer of the Killefer Manufacturing Company was well pleased with the result of the demonstration. "We booked orders for twice or three times as many implements at this demonstration as at any other of the demonstrations," he said. "The people who attended were interested in the things that were offered."

Stanley W. Smith, president of the firm of Smith Bros., distributors for the Cletrac, couldn't stay away either. The Cletrac sign was one of the largest on the grounds and the exhibit of tractors included about everything a tractor could ever be used for. One patch of the Cletrac ground was staked off to represent an orchard and the ground was worked up as fine as anyone could possibly wish. Mr. B. S. Swearingen, sales and advertising manager for the Cletrac department of Smith Bros., was in charge of the Cletrac performance.

Harry R. Lamster, advertising manager for Wm. F. Hughson, distributors of the Fordson, was the man with the megaphone which he used with ability and not without effect. The Fordson exhibit was attractive and all patrons were given every attention. A luncheon was given the organization by Mr. Hughson Thursday noon.

C. L. Best small tractor throwing up big chunks of adobe with a Sanders 4-disk plow. E. I. Crook, manager Los Angeles.

Bean Trackpull circling tree with ease and handling big load effectively in cramped quarters. Bean spray pumps also exhibited.

Fageol 9 h. p. tractor handling an Oliver 3-gang 26 inch power lift disk.

Sandusky 10-20 tractor handled by Washburn Bros., Los Angeles. A. M. Babcock, local manager.

Allen 12-20 tractor pulling Oliver 3-gang 12 inch power lift plow. E. G. Judah, with white hat, president Community Mfg. Co., Los Angeles.

Trundaar tractor 20-35 handled by Wm. Gregory & Son, Los Angeles, drawing a 3-gang 28 inch McKay power lift disk with subsoiler attachment 14 inches deep.

Bates Steel Mule, Model 60, tearing up the hard adobe to a depth of 12 to 14 inches with a 3-gang 26 inch disk with subsoiler attachment.

L. M. Railsback, looking after the interests of the Electric Wheel Company of Quincy, Ill., showed the new orchard model of the Allwork II. attracted much attention and gave splendid demonstrations of its pulling ability. This tractor was first shown in California, September 9th, and since that time orders for more than six of the orchard model have been booked.

J. E. Williamson, district representative of the LaCrosse tractor in company with Mr. W. B. Knapp, demonstrated the LaCrosse tractor.

The Scientific Specialities Company kept the home fires burning. They had kitchen stoves, lighting appliances and cookers all in operation using distillate and low priced oil. Albert C. was in charge.

The new disk plow, the McKay, was exhibited for the first time on the Coast. One observer declared that this particular plow was "The sensation of the whole demonstration." It certainly had the faculty of cutting into the dobe and turning over the great clods. The plow is equipped with 2, 3 and 4 units, power lift subsoiler attachment and everything else strictly modern. To particularize on one other attachment, it is an automatic release, which in case the plow strikes a big boulder or a stump and causes extreme strain, the release works automatically. It is handled on the Coast by Arnott and Company.

The Pomona air cleaner was given a thorough tryout for the first time by some of the tractors. This cleaner is a combination of a former type of centrifugal cleaner and of oily fiber through which the air is drawn. In case the oily fiber becomes overcharged with dust or grit all that is necessary is to drop it into distillate, rinse out, apply a heavier oil and it is as good as new. This air cleaner is now used on Moreland trucks and several types of tractors. It is manufactured by H. H. Garner.

R. B. Wheeler, Western manager of the Roderick Lean Manufacturing Company, came from his headquarters in Salt Lake City to install an exceptional exhibit of harrows and disks. Every farmer may now find the tool to fit every duty. The distributor for the Southwest is the B. Hayman Company.

The Moline Universal 9-18 handled a big double disk with perfect ease.

Manager Babcock took pleasure in putting the old time favorite Sandusky through any kind of a job requested by inquirers.

President Judah of Community Manufacturing Company with a corps of efficient workers demonstrated the Allen 12-20 with Oliver three gang, 12 inch, power lift plows.

C. L. Best tractor 75s, also smaller orchard types, were demonstrated under direction of E. I. Crook, Los Angeles manager.

Wm. Gregory and Sons were demonstrating the Trundaars with McKay power lift, three gang disk plows, with subsoiler attachment.

The little 9 h. p. Fageol didn't look it but it really got away with three gang 26 inch disks through dry hard lobe.

The Bates Steel Mule, several of them in fact, gave field demonstrations Also connected with dynamo and furnished current for moving picture tent showing methods of work in factory and field work of the Steel Mule.

The Little Bear of the L. A. Auto and Tractor Company hugged up close to the collar and never wearied in showing its ability to do heavier work than looked possible. Manager Brush reports having secured agency with big order for the Little Bean from San Salvadore through an advertisement in the California Cultivator. The California Cultivator "Covers California," likewise some of the rest of the world.

H. H. Myers, sales manager of the Stockton Tractor, was a busy man in charge of the demonstration put on by his company.

W. H. Grove, in charge of the field demonstration work of the Rock Island Plow company, looked after the interests of that factory. Mr. Grove stated that the general layout of the grounds, the conveniences and arrangements were the best he had seen at any demonstrations anywhere.

Mr. Stansfield, traveling field representative of the Wilson-Wetterhold company of Wichita, attended the demonstration in the interests of the feed grinders manufactured and sold by his company through the E. P. Osbyshell Company.

Honore Griffin, the 12-year-old son of Mr. and Mrs. A. Griffin of La Canyada, was exhibit "A" at the Cletrac show. Honore is a Barney Oldfield when it comes to demonstrating the Cletrac, which he has run for his father for several months, doing all the work. His father states that the youngster has saved him a thousand dollars in wages in being able to take the place of a man in driving the tractor.

"Uncle Ben" Holt of the Holt Caterpillar attended the demonstration and avoided the cameras as much as possible.

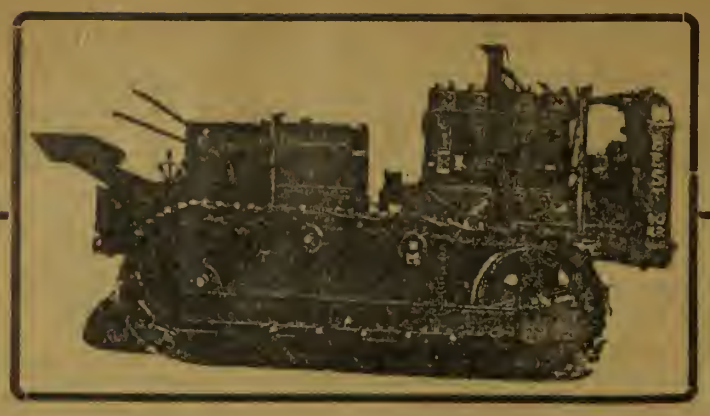
PREFERRED and recommended by all tire dealers, Firestone Red Inner Tubes are best for most miles per dollar.

These Tubes are made by the antimony cure process. This gives them remarkable heat-resisting qualities, assures longer life to both tube and casing and gives the kind of service which is a real economy.

Look for the name on the Tube—indication of the best of rubber and workmanship.

Firestone



THE BEST EXHIBIT

AT THE TRACTOR SHOW

WAS TWO NEW TRACK LAYER MODELS

TRACKLAYER

C. L. Best "60" Track Layer

Best "60" Tracklayer like the "25," the ultimate in tractor construction. Thirty-seven anti-friction Hyatt and Timken bearings. Weighs 17,500 pounds. Does the work of 35 horses. Will stay on the job as long as it is given reasonable care and attention. This tractor is scientifically lubricated; easy of access. Built like a draft horse throughout. Requires minimum attention.

C. L. Best "25" Track Layer

Best "25" Tracklayer. An anti-friction tractor driven by a heavy duty slow speed Best motor. Designed to meet the conditions under which this tractor must work. Built to last a lifetime with proper care and attention. Pulls its width in plows—runs on the land, not in the furrow.

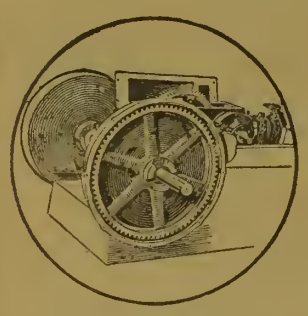
The LAUSON Wins Again

at Grand Forks, N. D.



All gears, including the final drive, are fully enclosed in a dust proof housing on the Lauson.

The city council at Grand Forks needed a tractor for road work. In order to determine the tractor best suited they had a competitive demonstration of the leading makes of tractors.

The LAUSON was selected as the tractor most perfectly qualified for the hard service entailed in the work of road-making. The important feature of the LAUSON in this connection is that all the working parts are completely enclosed. This keeps out the dust, dirt and grit which are ever present whether the tractor is working on the road or on the farm. By keeping the dust and dirt from the gears there is no loss of power through friction. There is no grinding of gears by emerylike dust and the possibility of breakdown and wear is thus minimized.

This is one of the features which has helped to make the LAUSON the "Pattern Tractor." If you would like to know the others we will be glad to send you full particulars on request.

The Evolution of the Tractor

By H. C. Heard, County Agricultural Agent, Maricopa County.

THE RAPID development and the great changes which have been made in the automobile industry are well known and interesting to all. In fact, automobiles, and of late aeroplanes, are thought of as the most sensational developments of modern mechanical genius. At the same time the tractor industry has been quietly and unostentatiously plugging on and really deserves more credit for the remarkable things it has done than it is given. On the big grain farms of the North and West steam power was early developed to run threshing machinery. It was a great step forward when some bold mind conceived the idea of coupling up a transmission, clutch and differential gear to enable the old engine to pull the separator from one job to another, for the large and heavy separators were quite a load to move and required so many horses that there were not enough left with an ordinary outfit to move the trap and bundle wagons without delay.

Another enterprising genius conceived the brilliant idea that if a steam engine could be made to pull a mammoth separator and a string of cars it might also be made to pull a plow.

The next enterprising genius conceived the idea of mounting a gasoline engine on about the same kind of running gear that the steam tractor had used. This labor saving device sometimes required most of the people in a community to start it, and once it got going it was by no means certain whether it would be stopped purposely or against protestations. It is even rumored that many operators hired men to sit up all night and keep the engine idling along to do away with the trouble that was expected from trying to start the machine cold. This type of tractor again developed the fact, which automobile makers already had found out, that no material was too good to put into a machine of such type and that a light piece of the very best of material was much better and more dependable than a big piece of cast iron. Operators also found out that the biggest expense incurred in a breakdown was not so apt to be in the cast of the new part or in putting it in but in the time lost. Furthermore, manufacturers had the habit of selling tractors to inexperienced operators, under untried conditions, for a small payment down and the balance by installments. In a few years the manufacturer owned most of the machines he had sold, and often was in difficult straits financially.

It looked to some as if the tractor game was a failure. Possibly some ideas borrowed from the automobile industry were the main saving features at this time. Small machines, modeled largely after their titanic predecessors, were put on the market and sold in many cases for cash. Since the vast number of farmers of the country operate fairly small tracts of land a bigger trade outlet was opened up. The farmer on the other hand was skeptical. He soon found out that the gas engine had been developed in the meantime and that it was possible to operate a tractor profitably. The remaining development was rapid, for the small farm tractor opened up the field in such a manner that a cash basis of trade could be used by the manufacturer and he was able to cheapen his costs of doing business.

The tractor has had a period of freak designs, from which it is just emerging. The war made labor-saving devices necessary and has put a good deal of money in circulation, times have been prosperous and in a very short space tractors have appeared in great numbers modeled after sensible designs, with moving parts completely protected from dust, the very best of materials have been used in the most delicate parts, the mechanism is fool proof to a large degree, but on the other hand, the operators have learned that just anybody can't run a tractor satisfactorily. The methods of doing business from the manufacturer to the retailer are sound, sufficient numbers of various makes are in use that repair parts and expert service are quickly available, and buying a tractor will soon be as safe and require as little investigating as buying an automobile.

SOW WHEAT PROMPTLY

A number of complaints were received last fall that wheat did not come up well after treating the seed with formaldehyde for smut prevention. In some cases this was due to failure to follow directions in giving the treatment, according to plant pathologists. In the majority of cases, however, the treated grain was kept several days or longer before sowing. Prompt sowing will prevent killing the germ.

It is recommended that wheat be treated in small lots only and sown as soon as it will go through the drill. It may be treated in the evening and sowing begun early the next morning. Some farmers treat in the evening what they can sow the following forenoon and in the morning what they can sow in the afternoon. Small lots are more easily and thoroughly treated and there is less danger of loss in case rainy weather should delay seeding.

Wheat may be treated by the sprinkling formaldehyde method or, if very smutty, by the soaking and skimming method. Directions may be obtained from the county agent or from the agricultural college extension service of the Ohio State University.

CELERY GROWING IN CALIFORNIA

By R. G. Risser

"Celery growers who have land in California should go very slow about moving to Florida to grow the crop." This was the statement made in the celery fields of El Monte by John E. Wade, manager of the Sanford Farmers Exchange, Sanford, Florida. After visiting all other important celery districts in the United States Mr. Wade was the guest of the crop production department of the California Vegetable Union on a brief trip through the celery fields of Southern California.

"In Florida we use from two to four tons of the highest grade fertilizer obtainable on each acre of celery land," said Mr. Wade. "We grow the plants in beds under canvas. We set them 3½ inches apart in the rows and 36 inches between rows. We spray regularly. We blanch with paper which comes in rolls and is held in place on each side of the row by wire wickets. We ship in crates about half as large as yours but only 16 inches high."

Before coming to Southern California Mr. Wade visited the Delta district on the Sacramento River. He was much impressed with this great district and declared that the island which he inspected was the finest celery land he had seen in the United States.

It was Mr. Wade's opinion that the crop in New York and Michigan would be marketed especially early this year and would therefore interfere less than it does sometimes with the marketing of the California crop. He said that New York celery men were not inclined to store and the late celery in Michigan had been seriously hurt by drought.

COMMERCIAL POTATO REPORT

The bureau of crop estimates issues the following quantitative report and comments on the late or winter commercial potato crop of the United States based on conditions September 1. This report deals with that portion of the crop shipped in carloads and represents the surplus or highly commercial movement.

The states in the following table include all those states producing late potatoes in considerable commercial quantity for other than local market. The carload movement of late potatoes from these states this year is now estimated at 123,518 cars or approximately 86,462,600 bushels, as compared to 146,048 last year, or 102,233,600 bushels or 85 per cent of last year's commercial crop. Indications are that the commercial crop of late potatoes is about 10 per cent less than the average. In general the crop is very good in the East, which indicates a production of 40,818 cars in Maine, New York and Pennsylvania, or 94 per cent of last year.

In the heavy producing states of Michigan, Wisconsin and Minnesota, the production promises to be 55,075 cars as compared to 63,510 cars last years, or 86.7 per cent of last year. The Rocky Mountain states have a comparatively light crop, and Colorado, one of the very important states in the country in late potato production, promises but 68 per cent of last year's crop.

The Northwestern states of Oregon, Idaho and Washington promise to ship about 11,500 cars as compared to 13,205 last year, or 87 per cent of last year's crop.

Among the states highest in production Maine promises to lead with 24,468 cars, 700 bushels to a car, of which 20,883 cars will come from Aroostook County. Minnesota second with an even 24,000; Wisconsin is third with 20,800, and Colorado and Michigan are nearly tied with a few more than 10,000 carloads. Blight and rains reduced New York's crop by one-fourth. Unfavorable conditions are reported from Colorado, Idaho, Oregon and Nebraska.

This report does not give figures for California and in explanation states that figures are for late and storage potatoes, "while the very large production of California and some other states is largely early or truck potatoes." The total production of California last year was over 18,000 carloads and we ate them all. We also grew about 1500 cars of sweet potatoes.

FIFTY-SECOND FRUIT GROWERS' CONVENTION

By Bronte A. Reynolds

At a meeting of the committee called at Chico, 1 p. m., September 16, it was decided to hold the Fifty-second State Fruit Growers' Convention the second week in November. The county horticultural commissioners will hold their meeting during the first two days, November 10 and 11. On the afternoon of the 11th a visit will be made to the United States plant introduction gardens located southeast of Chico on Butte Creek. The Convention proper will commence on Wednesday, November 12, and continue until Saturday afternoon, November 15.

Wednesday will be occupied with a consideration of cooperation and standardization. Thursday the meeting will be at Oroville and the subject will be citrus and olives. Friday the meeting will be at Chico again and the subject will be deciduous fruits. Saturday the convention will meet at Durham, the morning being devoted to an inspection of the state land settlement there, and the afternoon to a general farming discussion.

THE TRAILER LEADS

That may sound contradictory but when it comes to reducing expenses of light hauls to market the trailer heads the list. It has been estimated that it costs but an eighth as much to haul as it would to haul the same load with horses, so that now the trailer is looked upon as part of the equipment of every up-to-date rancher. The saving of time is of course the value of the change from horses. In purchase of a trailer get one that is hung low and does not wabble or side lash. Some are so unstable in the latter respect that good speed cannot be made.

SOUTH AMERICAN MARKETS

During the last month W. W. Ewing, trade commissioner of the department of commerce, has been covering California and telling us of the fine chances for marketing our wares in South America. In his recent trip he covered every part of the continent except Paraguary and the Guianas. As the west coast is the side of the land that most interests us, it is of interest to know that good markets are to be found there for lumber, cement, food products and flour.

FACTS FOR FARMERS

The Los Angeles public library is doing good work for those interested in agriculture, and especially so for the practical farmer, in gathering a fund of information which touches upon the science and practice of farming. To the end that this information is available the library has issued "Facts for Farmers" giving a selected list of books on agriculture, horticulture and animal husbandry. This booklet is free to every patron of the library and every producer who happens in Los Angeles with a spare moment on his hands will find it to his benefit to visit the library.

ENFORCING GRAIN REGULATIONS

The United States Grain Corporation is enforcing its regulations with dealers who are lax in observing the rules laid down as to profits, etc. A big Texas concern has just been deprived of its license to handle grains because of its violation of the food control act.

Motion picture films have been issued by the department of agriculture showing fruit growing activities in California.

Melons ripen more evenly if placed on boards or tile.

The Tractor to Buy

ARE you one of the many farmers who need more power to handle the farm work properly? Do you have to work with less help than you need?

If so, you need an International kerosene tractor. The size that gives you power for your heaviest load will handle all the work. Internationals use only as much fuel as the load requires. They are made to work with farm machines—the kind you are now using—and special hitches are provided for all kinds of field and road work. Their belt pulleys are large enough to prevent slippage, run at correct speed, and are set high enough to keep the belt off the ground. They all use kerosene or other low-grade fuels which means a big saving in operating expense.

The Company to Buy From

You know that we have supplied farmers with high-grade machines for nearly 88 years. You know that our tractors have furnished satisfactory farm power for more than 12 years. We have far too much at stake to market machines of any but the highest standards of quality. We expect to come back some day and sell you some other machines in the long list you see in this advertisement. In every sale we try to build for the future.

Tractor Service Whenever Needed

In line with this policy, we have developed a service organization which now consists of 89 branch houses and many thousands of loyal local dealers, wide awake and attentive to the needs of their customers. Service is a very essential part of any tractor sale. When you buy an International kerosene tractor you buy with it the assistance of an organization that brings a well stocked branch house or a live, local dealer within telephone call, fully equipped to keep your tractor working steadily.

International Tractor Sizes

International tractors, all using kerosene for fuel, are made in 8-16, 10-20, and 15-30 H. P. sizes. A line to the address below will bring you full information about all our tractors and about any other machines you mention in the list shown in this advertisement.

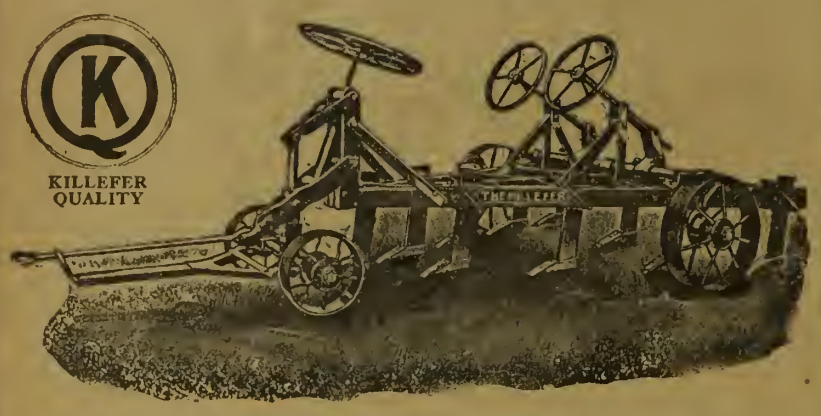
TRACTOR CHISEL



Now is the time to commence deep chiseling and subsoiling. Do it in time to prepare the ground thoroughly to receive the benefit of the winter rains. Break away from the old habit or mistaken idea of scratching the ground and expecting to harvest a crop.

Plow pan, although frequently referred to as mechanical hardpan, should not be confused with natural hardpan. However, so far as crop production is concerned, the effects of plow sole and hardpan are the same. Both must be destroyed before proper cultivation can be had, and the only difference in the two that will be considered here is in the method required for their destruction.

Plow sole offers less resistance to the available methods of breaking it up than hardpan, and, with the tractor and tool of sufficient strength now available for tractor use, it can be broken up and subdued, bringing the land back to the point where a full yield may be expected.

Plow sole offers less resistance to tillage implements than does hardpan; both are in many cases impervious to horse teams and ordinary plows and in some instances are difficult of handling with tractors and modern implements. Yet before a full yield may be expected this condition must be subdued, and to date the only satisfactory means is by use of the chisel or subsoiler.

THE 1919 RAISIN CROP

The prices of raisins having been agreed upon by the board of directors of the California Associated Raisin Company, the grower may know that if the entire crop is utilized the prices to him will be 10 cents for Muscats, 11 cents for Sultanas, and 11½ cents for Thompson Seedless. There never has been a time when prices were so hard to fix with equity to all concerned, owing to disturbed commercial conditions throughout the country. The crop will be the heaviest yet grown, so far as present estimates go. The Sun-Maid Herald gives the following figures and statements:

"The present estimates indicate that the crop this year will be 200,000 tons. This will constitute a record as the highest tonnage previously grown was the 1918 crop, which amounted to 165,000 tons. This is an increase of 130,000 tons over the average of previous Association years. Our share of this crop should amount to 175,000 tons, and of this amount we have sold 150,000 tons that should be manufactured and shipped before January 1.

In the past two years we have spent over a million and a half dollars in new plants and equipment, and are now better prepared than ever before to handle the crop with promptness, but in spite of this great expenditure there are a number of points at which we do not have the necessary equipment, and it is possible that there may still be some annoying delays this year. If we are able to do so approximately a half million dollars more should be spent in these points next year, and this should complete our building program with the exception of what is necessary to keep up with the annual increase from year to year, and from that time on—barring shortages of cars and shook, which are things that are entirely beyond our control—the annoying delays at the packing houses of the past few years should be entirely eliminated. We are constantly striving to improve our methods so that a large share of the work can be done by machinery and are getting better organized from year to year, and we do not feel that for much longer we will need to be ashamed of our treatment of the growers. It is not our purpose to shuffle the blame for conditions in the past from our own shoulders as we realize that much of the fault has been with us, but we cannot refrain from suggesting to the growers a few things that have made our work difficult that we think can be remedied. In the first place many of the crops that are delivered to us are not dry enough to manufacture. They may not be wet enough to cause a rejection, but they cannot be run through the machinery, therefore, it is necessary to store them away which results in a congestion in the packing houses and makes it impossible to promptly return the boxes for which the growers are clamoring. With the high prices that we are receiving this year we believe that every grower should make it a special point to see that his crop is in as near perfect condition for manufacturing at the time of delivery as is possible.

Another suggestion is that, during the height of the delivery, no grower should deliver over one load a day. In the past growers who have lived close to the packing houses have delivered five or six loads a day, making it entirely unfair to the growers who live further away and causing a great loss of time to all who are delivering. In these days of high wages and shortage of labor it seems a pity that so much time should be wasted waiting at the packing houses—time that might be saved if the growers would exercise a little more patience.

Another point that we wish to emphasize at this time is one that has been learned by the experience of last year. Regardless of weather conditions no releases for the purpose of selling to the outside packers will be made this year. Our experience was last year that when only a few releases were made it was an advantage to the individual that got the release, but when they were made to apply to all, the system broke down and raisins that were worth from four cents to five cents were selling within a week at less than two cents because the drying facilities of the outside packers do not amount to anything compared with the great number of raisins that were offered and they at once took advantage of this condition. We realize that it may seem unreasonable on our part to the grower whose crop is suffer-

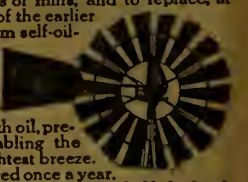
THE SELF-OILING WINDMILL

has become so popular in its first four years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil, preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.



We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

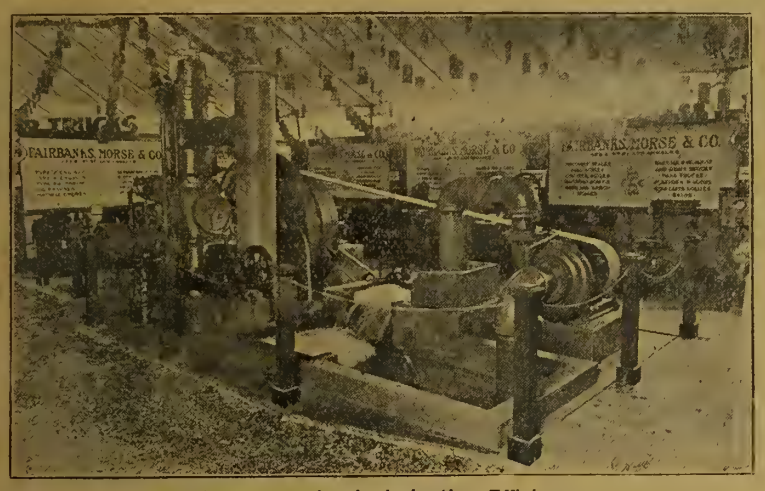
CARL G. JORN
Jorn Bldg., 57 Plaza Square, Orange, California

ing to refuse to make a release when some one else offers facilities that we cannot furnish, but in the signing of these contracts the burden of drying the crop and delivering it to the packing house in a merchantable condition rests with the grower and when we once start making releases there seems to be no place to draw the line between those that actually would be lost and those that could easily be saved without going to the dryer. We have spent a great deal of time and money to get these contracts, and as we see it ,the very life of our organization depends upon the control that we have through these contracts and though it may seem unreasonable to



A Demonstration in Irrigation Efficiency

The Fairbanks-Morse people made demonstration most convincing to many an irrigation farmer. Fifty H. P. semi-Diesel attached to centrifugal pump. Capacity 150 inches at 60 foot lift. Cost, approximately $6000.

the particular grower that is wanting the release, we cannot feel but that from an industry point of view these releases should not be made and we are making this statement now so that the growers will have plenty of time to make any arrangements that they feel are necessary for the saving of their crops. The probabilities are that this question will not come up this year, as, if we can judge by the law of averages, a good season should follow on a disastrous season of last year.

SEEKING MORE MEMBERS

The California Prune and Apricot Growers, Inc., have sent out a letter to the growers not members of their organization, from which we quote the following pertinent paragraphs:

Our directors' recent action in the passage of a resolution in accordance with the terms of which the Association's exercise of option on members' crops for the years 1920 and 1921 will be made contingent on the signing of a certain greater acreage to be specifically named during the fall. The directors have considered this action necessary and business-like in their best attention to the development of markets for prune and cot products.

Our present contract with all growers, you will understand, depends for continuance beyond the season of 1919 on the Association's exercise before March 1st, 1920, of option on crops of 1920 and 1921. The exercise of this option marks our passage of certain important stages in our career. We have during the life of the Association maintained a certain expensive canvass of non-members. In this canvass we have made appeal to you as men, neighbors and fellow-growers.

Monarch Neverslip and Lightfoot Tractors

This is L. L. Darveau and his 30-18 Monarch Neverslip

A size for every purpose; each one will do its work, wet or dry, hot or cold. Plow your fields, cultivate your orchards, thresh your crops, pull your beets, fill your silo, pump your water, grind your feed. They are a Farmer's real friend.

Read What He Says

Ventura, Calif., June 25, 1919.
Monarch Tractor Co., Los Angeles, Calif.
Attention Mr. Wuthrich.

Dear Sirs: I am writing to tell you what I think of my 30-18 Monarch tractor, which has given me so much trouble in the past. I bought the machine in 1918. It was equipped with a motor which proved very unsatisfactory to me, as the tractor never would do the work it was guaranteed to do.

Your agent has changed it by putting a Beaver motor on it, and since doing so the machine has done everything I have asked of it.

I have pulled an 8-foot chisel, and an 8-foot cyclone, and am now pulling a DA 214 three bottom John Deere plow just as deep in the ground as the land lever can be set and run the plow level. I am pulling this on ground which has not been worked since early spring, and on grade as well, and pulling them on high speed. I regard the plow as a good 14-horse load in my soil, and the motor handles the load without any sign of overload. I would recommend your tractor to anyone who expects to buy a tractor.

Respectfully, L. L. DARVEAU.

This is only one of many satisfied users. Write for our free book, "Monarch Performance," which tells of many other satisfied users.

When you buy a MONARCH TRACTOR of any size, you buy a tractor with a track which is practically indestructible; not a constant source of expense and annoyance. Coupled to this you buy a motor with sufficient power to do the work and deliver the power that is claimed for it.

Our tractors are ready to prove every claim we make for them. Don't be deceived. Ask to be shown.

ANNOUNCEMENT

Increased production enables us to furnish the "Little Bear" Tractor for the coming season, complete f. o. b. factory, Los Angeles, Calif., at $795.00.

The "LITTLE BEAR" Tractor

NO EXTRAS — READY FOR WORK

Made in Los Angeles

$795.00

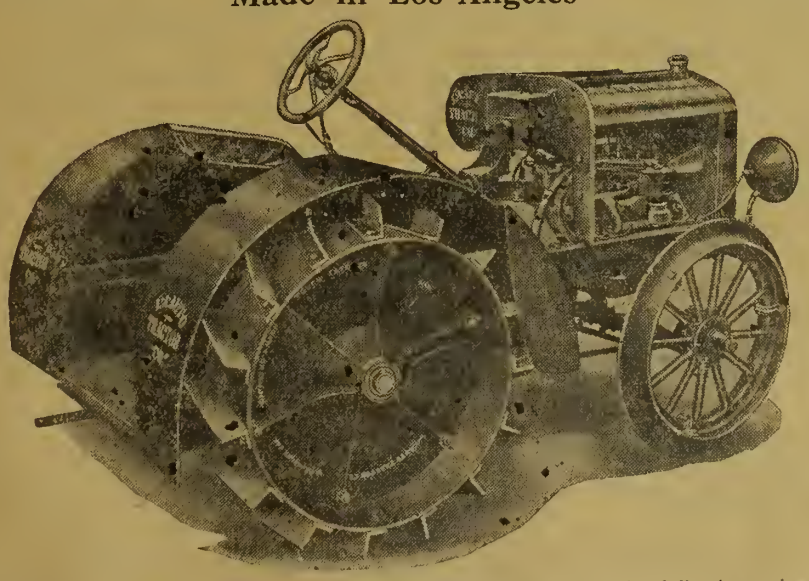
The "Little Bear"

Four Horse at the Draw Bar
Forty-Four (44) Inch Track
Fifty (50) Inch Wheel Base
Fifty (50) Inches High, over all
Turns in a Ten (10) Foot Radius
Weighs Only 1800 Pounds

All Gears enclosed and kept dust-proof by a device used on no other Tractor.

Roller Pinion: The spool is cut and machined from steel bar—the rollers and pins hardened.

"Bennett' Air Cleaner is furnished to clean the air entering the carburetor, keeping the cylinders and pistons free from grit and dust.



$795.00

The "Little Bear"

Ford Motor and Transmission used, which means you can get FORD parts for repairs. Time and money saved by this feature alone. FORD parts are cheap in price, high in quality and obtainable anywhere and everywhere.

Cooling System: We do not use the Standard FORD Radiator. Our own special cooling system does the work. 90 per cent of users of "Little Bear" Tractors do not consume over a quart of water a day in nine hours run.

The Fenders are made sufficiently low and wide to protect the fruit and low lying limbs in the orchard. A wide platform, special hitch with swinging draw-bar for close-up work around trees and an electric light for night work are all included in the price of the Tractor.

The "Little Bear" will work in the open field as well as in the orchard.

Can furnish implements suitable for perfect work with the "Little Bear" Tractor, at the following prices f. o. b. factory, Los Angeles, with order for tractor only.

Special 3-Gang 8 inch Bottom Plow $65.00

No. 14 Forkner Spring Tooth Cultivator; Gardner's Combination Cultivator and Furrower— Special Price on Application

L. A. Auto Tractor Co., 52nd and Santa Fe Ave., Los Angeles, Cal.

Santa Fe Springs, Cal., Sept. 1, 1919.

Gentlemen:—

It is now about two years since I purchased one of your "Little Bear" Tractors, using it on my ten-acre orange grove, and the machine has proven itself to be satisfactory in every way and even doing more than you claim for it.

Have been able to cultivate my grove both ways within six hours and at a cost of about $1.20 for gasoline. Have not had a horse on my place since getting the "Little Bear" nor will I have one again, as it does the work so much better in every way and especially in getting the implements close up to the trees without damaging them in the least. For short turning, it is a little wonder, and so easy to handle that a small boy could do the work as well as a high priced man, as would be required on other tractors.

After irrigation, on account of its light weight, I am able to get into my orchard from one to two days earlier than with any other tractor.

As to repairs, will say that it has been of such a small nature that I have not even considered it an expense.

Wishing you the success you deserve in giving the small rancher a Tractor that will do the work of from three to four horses and so economically run, I am,

Yours very truly, J. R. AGEE.

=SALE=

of Bred

Poland-China Sows

"Your Chance to Make Money"

Saturday, Oct. 4, 1919

at Modesto, Calif.

HALE I. MARSH and LES McCRACKEN

SELL

50 Bred Sows and Gilts

A few words about the Sows

The Sows

For the past eight months we have been carefully watching and culling our females that we might offer in this sale only such animals as would properly represent the breed both as to individuals and blood lines. They are sired by **Model Major**, twice grand champion and the sire of Major Hadley Wonder, grand champion of 1917; **Kings Big Bone Leader**, 1918 grand champion, I. B. A. Wonder, reserve grand champion P. P. I. E. and Blue Valley Tecumseh by Blue Valley, one of the greatest boars of the breed.

Many breeders have seen these sows and not one said they did not like them.

The Boars

to which these sows will be bred offer the breeder and the farmer unlimited opportunities for adding to their herds proven blood lines or the purchase of foundation herds that will place them on a sound business basis. The sows will be bred to **Kings Big Bone Leader**, grand champion 1918, and not only the most popular Poland-China boar, but a boar with more sons at the head of herds than any other boar on the Coast.

To **Major Hadley Wonder 2nd**, full brother to Major Hadley Wonder, 1917 grand champion, Blue Valley Big Bone and Blue Valley Big Bone 2nd.

Can any sale offer such attractions?

Make comparisons, visit other herds, see the sows and boars; you will then realize what unusual opportunities this sale presents.

Big Meeting and Dinner.—The Poland-China Breeders' Association have been invited to meet in Modesto the evening of Oct. 3rd to meet the farmers of the community at dinner and talk over the Poland-China hog as a money making animal.

NOW REMEMBER this sale will be held in Modesto Saturday, Oct. 4th, 1919.

Every Animal Cholera Immuned.

Hale I. Marsh — Modesto

Les McCracken — Ripon

October 16, Dr. H. M. Elberg, Woodland.

Hereford Cattle

November 7. Third annual sale Pacific Coast Hereford Breeders' Association, San Francisco.

Poland-China Swine

October 4. Marsh & McCracken, Modesto.

October 7, Bassett, Ross and Crawshaw, Hanford.

October 11, Kings County Poland-China Breeders' Consignment Sale, Hanford.

October 18, Trewhitt, Vaughan and Nehls, Hanford.

October 21, Tulare County Poland-China Breeders' Association, Tulare.

Marsh and McCracken who will hold a Poland-China bred sow sale in Modesto Saturday, Oct. 4th, have this to say regarding the sows in the sale and the boars to which they are bred: For months we have been watching our herds that we might select for this sale such animals as we thought had sufficient quality to properly represent the breed as it should be represented. We cannot see how the blood lines could be improved and the boars to which they are bred are already proven sires of the right type. The State Poland-China Breeders' Association has been invited to meet in Modesto on Friday night preceeding the sale at which time a banquet will be served. The farmers and dairymen of the community will be invited that they may meet the representative breeders of the state and become familiar with the opportunities to make money raising Poland-Chinas.

Eighty bred sows and gilts will be the offering of the Kings County Poland-China Breeders' Association to be held in Hanford, Saturday, October 11th. During the past year a large number of high class boars have been added by a number of breeders and these, together with those already well known as popular sires, will be mated with the sows and gilts in this sale. These sales have a firm hold on the buying public of the state and are conducted in such a manner that tends to inspire confidence in those in attendance.

In the Poland-China sale of bred sows to be held in Hanford, Oct. 7th, by Bassett, Crawshaw and Ross the animals to be sold have for their sire boars that have been an important factor in building up Poland-Chinas in California. The sows have been selected from these three herds and will be bred to King's Timm, Model Fellow, Jr., Big Timm and Some Price.

Mr. Ross states that the requests for catalogs indicates a sustained interest in good Poland-Chinas such as will be sold in this sale.

W. D. Trewhitt, C. H. Vaughn and G. H. Nehls will hold a sale of big type bred Poland-China sows and gilts in Hanford, Saturday, October 18th.

This sale will, no doubt, attract a large number of buyers due to the size and attractiveness of the offering. Only animals of strictly big type breeding will be sold and the demand for this kind of Poland-Chinas is greatly in excess of the supply.

H. D. McCune, Poland-China breeder, Lemoore, has recently sold to Lewis C. Story, Anderson, three bred gilts by his senior herd boar, King's Massive Orange. Also three bred gilts to Teeter Bros., Stratford, one to T. J. Woodworth, Stratford and a boar pig to Bailey and Lowe, Lemoore.

Henry Cummins of Visalia, breeder of Duroc-Jerseys, announces the sale of three herd boars, all his brood sows, excepting one, and all his spring pigs to the Boston Land Company, of Henrietta. Mr. Cummins has not retired from the Duroc field, but is planning now for the purchase of a number of sows for spring farrow. These will be selected from a number of Eastern herds.

The sale announced by Dimmick Bros., and C. G. DeRaad, to be held at Hanford, September 30, has been called off. The two herds were sold to the Boston Land Company, Henrietta, at private treaty. Those who had anticipated attending this sale are advised of its cancellation.

The Duroc-Jersey Breeders Association of California held its annual meeting and banquet at the Travelers Hotel, Sacramento, Monday evening, September 1. The principal part of the meeting was the discussion of ways and means for breed promotion. It was decided to hold their first breed promotion sale at University Farm, Davis, January 14, 1920. Following this decision more than $1000 was raised by popular subscription to be used in advertising the breed. Officers elected for the coming year are R. K. Walker, president; V. F. Dolcini, vice president; S. E. Whiting, secretary-treasurer; H. H. Braly, H. C. Witherow, Donald H. Graham, H. M. Berglund, board of directors.

The sale of Poland-Chinas to be held in Lodi September 19 by the San Joaquin Poland-China Breeders' Association offers unlimited opportunities for those desiring to purchase boars ready for fall service. Forty will be sold, as well as 20 bred gilts. The winnings at the state fair of the breeders consigning to this sale affords ample proof as to the kind they are breeding. As this is the first sale of the association they are using great care in the selection of the animals to be sold. It is natural to suppose that the sale will he well attended and that a satisfactory average will be obtained.

The increased interest in the approaching banner sale of Poland-Chinas that will be held in Hanford September 17 by W. L. Haag & Son and John M. Bernstein is due, no doubt, to the prominence of the boars to which the offering is bred. Fifty bred sows and gilts will be sold selected with great care from the herds of these two breeders. The offering of Haag & Son will be bred mostly to Lendorris Liberty Bond, a son of Liberty Bond, although a few will be bred to Young Jumho, a grandson of Long Jumbo, the sire of the $18000 boar, Mabel's Jumbo. The Bernstein offering will be bred to The Yankee Jr., a son of the famous The Yankee, and a boar found to attain prominence as a sire on the Pacific Coast. No doubt this sale will attract buyers from all parts of the coast.

H. C. Witherow, manager of Greenwood Farms, Live Oak, announces the purchase from H. P. Slocum & Son of Uneeda Queen Model 2nd, the 3rd prize senior yearling Duroc-Jersey sow at the state fair and Uneeda H. A.'s Queen a winner in the junior yearling class, both sows being bred for early fall farrow to Experimental Defender. Mr. Witherow also purchased for his uncle, H. S. White, Chino, Uneeda Orion Lena also bred to Experimental Defender. The consideration was $2000.

R. E. Watson of the Henderson Company, Sacramento, reports the sale of an 11 months old Holstein bull by a son of Lottie Walker Spofford 3d to the Dominick-McGrath estate, Oxnard; a yearling son of Pontiac Segis Inka to M. Johnson & Co., Salinas, and two two year old heifers to C. C. Tidd of Nevada. Mr. Tidd also selected two young heifers from the Bonita herd.

Just hefore the state fair the Del Paso Stock and Swine Breeders' Association purchased from the Henderson Company, Sacramento, the yearling Holstein bull Bonita Sir Cornucopia Gliste for $500. At the fair this young bull won first as junior bull and was later made junior champion. An offer of double the purchase price was refused.

V. F. Dolcini, proprietor of the June Acres Stock Farm, Davis, has sold to Markofer & Latta, Elk Grove, Tagus Sadie Vale De Kol, the second prize junior yearling Holstein bull at the recent state fair.

J. P. Cook, Poland-China breeder, Paradise, who on joining the army sold his herd boar Forrestview Bob by Caldwell's Big Bob, has repurchased him. He has also secured a boar by Repeater out of a Disturber sow.

W. M. Collier, a prominent Hereford breeder of Missouri, has been visiting a number of the Hereford herds of this state. Mr. Collier stated that he knew of no better territory for the expansion of the Hereford business than California affords. While in this state he was given a number of substantial orders to be filled for fall delivery.

H. P. Slocum & Son, Willows, have sold to V. F. Dolcini of the June Acres Stock Farm, Davis, the Duroc-Jersey sow Uneeda Queen Model, grand champion at the 1918 state fair. Uneeda Queen Model was sired by King's Col. and her dam was Model Lady.

A Holstein sale that is attracting attention was consummated recently when Gotshall & Magruder of Ripon sold to Pecho Land and Cattle Company, San Luis Ohispo, a son of the W. J. Higdon bull, King Korndyke Pontiac 20th, and out of K. P. Tola Foe, holder of the state record as a senior two year old. The youngster is one of the best bred calves in the state and his future development will be watched with interest.

Not every high class herd of breeding swine can afford the luxury of a show herd. But there are some very excellent herds of Durocs in the south end of the state that will get more or less into the limelight with the advent of the forthcoming shows in this section. Among these are the Ireland Rancho herd at Owensmouth, the Falfadale Farm herd at Perris, the Del Sur Rancho herd at Lancaster, and the Golden Model herd at Van Nuys. The Duroc show at Los Angeles promises to be the big event of the year.

R. K. Walker, manager Winsor Ranch, Bonita, reports the following sales of Duroc-Jerseys: To the Hazel Louise Farm, owned by S. E. Whiting, Sacramento, a fall boar by Top Sensation and three senior sow pigs, two of which were second and fourth in class at state fair. Two were bred to Great Sensataion 3d and one to Winsor's Giant Orion; to H. F. Bahmeier, secretary Durham land colony, a boar pig from Model Defender Lady, grand champion sow at state fair, by Great Model.

Walter T. Gatton, manager Diamond Bar Ranch, Spadra, has sold two Duroc-Jersey sows bred to Mammoth Sensation 2d, reserve grand champion boar at the 1919 state fair, to the Western Hog Company, Sacramento. It was reported that the Diamond Bar Ranch was offered $35,000 for this show herd.

McCarty and Starkweather, Poland-China breeders of Modesto, have sold E. Miner, Lodi, Smooth King, a junior boar pig by Kansas King, the price being $450. Mr. Miner will use him lightly and grow him out for the shows next year as he considers him an excellent prospect.

The agricultural extension service of the college of agriculture of the university has joined in the "Better Pork Crusade" which the United States department of agriculture will begin throughout the country on October 1st.

Shirley Christy, secretary of the Arizona State Fair, has mailed out the premium list and indications are that the state fair will be the best in history. New exhibition space and improvements to grounds and buildings, several premiums, and attractive programs are assured. The fair will be held at Phoenix, November 3-8.

King's County has firmly established itself as the state center for Poland-Chinas. In Hanford, Saturday, October 11, the King's County Poland-China Breeders' Association will hold their eighth semi-annual sale of bred sows and gilts, with a few high class boars. In this sale the herds of the following breeders will be represented: G. I. McCune, G. Nehls, C. L. Newport, H. E. McMahan, W. L. Haag & Son, T. J. Woodworth, R. G. Hamlett, H. D. McCune, R. L. Waltz, C. A. Waghn, W. T. Dice, W. S. Hubbard, C. A. Crawshaw, M. Bassett, C. G. Raad, W. D. Trewhitt, C. Dimmick, M. Bernstein, E. G. Meyer, W. Bernau and F. D. Ross.

Shorthorns of Rare Quality

Details incident to the settlement of an estate, and the readjustment of some farm leases, make it advisable to the owner to make a substantial reduction in the well known Roselawn Herd of registered Shorthorns, and there will be offered at public auction by

Roselawn Stock Farm

H. M. ELBERG, Proprietor

Woodland, California

Thursday, October 16, 1919

45 Scotch and Scotch Topped Shorthorns

The Roselawn herd has been established for thirty years, and has always been a factor in the progress of the breed in the west. Its show ring record, and the general satisfaction which has attended its hundreds of individual sales of breeding animals to breeders and rangemen have earned for the herd a degree of public confidence that should be highly satisfactory to the owner.

THIS OFFERING AN OUTSTANDING ONE

It is entirely conservative to state that the offering to be made in this sale exceeds by a wide margin in both numbers and average quality any previous offering made from the Roselawn Herd, while the large number of individual top attractions constitute a group that stands as one of the notable offerings of the breed in the West.

THE FEMALES

Among the splendid females to be sold are MISCHIEF E 34, undefeated in Canada, Grand Champion at 1918 California State Fair, and dam of ROSELAWN CHAMPION, junior champion at the same fair and present herd sire in Roselawn Herd; ROSIE MAYFLOWER, the great white heifer who fills the eye of every judge who has seen her, and she is a daughter of Sultan Mayflower, the University Farm bull that sired California Marvel, champion Shorthorn steer at the 1918 Chicago International, and the $5500 bull California Model; MAYFIELD MAGNOLIA, also a daughter of Sultan Mayflower, selling with roan heifer calf at foot, and bred back to ROSELAWN CHAMPION; LOVELY'S PRIDE 3D, a beautiful roan heifer of the Cruickshank Lovely family, bred to ROSELAWN CHAMPION; and others of splendid breeding and quality, including about 15 GREAT FEMALES WITH CALVES AT FOOT BY NOTED SIRES.

THE BULLS

The offering of bulls in this sale may well be rated as one of unusual merit. The group is headed by CRESCENT DALE, now in service in the Roselawn Herd, he by Whitehall Rosedale, son of Avondale, and out of a daughter of Ruberta's Goods and the imported cow Crescent 5th. He is a smooth, thick fleshed bull with desirable size and unusual quality, and on his individuality and the proven excellence of his calves he is entitled to a place in any high class breeding herd. Besides CRESCENT DALE there is a choice selection of Scotch and Scotch topped bulls that should find favor with both breeders and rangemen.

Every animal guaranteed to be a breeder

Every animal over 6 months old tuberculin tested

Come to this sale and take part in one of the most important events in western Shorthorn progress to date. You will find a delightful farm, a high class herd, and an owner and breeder who is breeding and developing good Shorthorns in a broad gauge way.

Catalog of sale free on request.

The Keep On Herd Register of Merit Jerseys

Fifteen Keep Ons won twenty-six prizes and one gold medal. All three first prizes for production went to the Keep Ons. Grand Champion cow and Champion butter cow won by Keep On Herd. Buy a Keep On and get the best. Nothing finer or better. Bred for both show and production. Males and females at reasonable prices. Write your wants.

Dr. H. W. Hand Orland, Calif.

Start With Shorthorns Now

The time to start with a few registered Shorthorns is now. They are as cheap today compared with other values as ever. The sooner you get started the sooner your profits will come in.

It doesn't require a large acreage. Whether your farm is large or small you can handle pure-bred Shorthorns profitably.

Don't keep three grades if one Shorthorn will make as much return as the three.

10 Jersey Bulls

We have recently purchased the entire pure bred Jersey herd of Houston & Son, Imperial, — 143 head, and offering young bulls from $50 up. These are bred in the purple. Write for particulars.

Arden Dairy, Certified
El Monte, Cal.

W. V. Bennett, Nord, owner of the Butte County herd of Duroc-Jerseys, has sold a gilt by Uneeda Orion C and out of Butte's Golden Pet to the Gardiner Ranch, Sacramento.

Among the fine strings of Hampshire swine to be seen in the line-up at Riverside and Los Angeles in October will be a well groomed exhibit from the Fairbanks Ranch at Redlands, A. E. Harvey, manager. Mr. Harvey's exhibit will in large measure feature the big boar Harvey's Choice, an excellent son of Langdon's Choice and Lion Queen. Harvey will show a young boar that will cause the ringside talent to sit up and take notice.

Report from the Llano Vista Ranch at Perris, relates that the fine Hampshire brood sow, Sioux Tipton, daughter of Sioux Queen, grand champion sow of the world, on September 1st, farrowed a litter of 13 finely belted pigs. Other things are flourishing accordingly and manager F. A. Langdon promises to be at the front at the Southern California live stock shows with his usual representative exhibit from the pioneer herd.

BUNK—AN EDITORIAL

Continued from Page 405.

Milk is an essential food. It is important that a steady supply be provided at a reasonable price. Prior to the organization of the various associations, the major portion of the supply reaching the public came through the distributor. The distributor was interested primarily in whole milk. If the demand was greater than the supply the supply was stimulated by better prices to the producer. If the supply was in excess of the demand, production was discouraged. And when a surplus was accumulated it was disposed of by pouring in the sewer. The price charged the consumer had to cover losses on surplus. On such a basis the supply of the highly essential food was not on a stable basis.

The associations are operating on the following basis: First it is the plan to keep the dairy industry on a basis equal to the public need. But the public demand fluctuates with the seasons. Therefore the optimum demand must be kept in mind and a method adopted for handling efficiently the surplus at such times as a surplus exists. The only method open was to construct plants through which the surplus could be handled. This they have done. At different points in the state modern by-product plants have been built and the establishment of these plants enable the dairymen to produce a maximum of milk and feel certain that any surplus will not be wasted. These plants make available food values that would otherwise be wasted, and permit the saving of such losses as would, under the old system, be charged up to the public. Then why all this hue and cry and opposition? Simply this: Privately owned plants and distributing organizations have suffered by shortening the route from producer to consumer. In an effort to save their hides, they have turned to the third interested party—the consumer—and by insinuations and small practices are attempting to make the public believe that the purpose of the producers is to fix an exhorbitant price on milk, and they have succeeded in deluding a few of the producers—the malcontents—into imagining that they are about to be put out of business. But they have failed to delude the big army of clear-headed and practical dairymen and they will fail to make headway with the public, once the facts are known.

Now is the time for every dairyman to keep his head. Now is the time for every member of other producers' organizations to lend help and support. If the milk producers lose the fight will shift to other lines of production.

If any law has been infringed we are certain that it has been unintentional. The idea back of these organizations is sound and honest. California dairymen are not law breakers. All that they ask is a square deal and a fair price and if the present law does not grant them the right to organize and operate along lines calculated to make their business efficient, then now is the time to plan for a law that will. In the meantime we will look for many shifting angles of the fight, and continue to regard the many charges against the dairymen as bunk—with a deeper motive back of it all.

GUERNSEYS

196 — 368

These figures represent the average butter fat production of a grade herd in Minnesota before and after the use of a pure bred Guernsey bull. The improved herd brought the owner prosperity, — the original, only drudgery. Write to breeders for descriptions and prices and send for our free booklet, "The Grade Guernsey."

SAN FRANCISCO SHOW OFFERS $36,000

IN arranging the premium classification for the California International Livestock Show to be held in the California Building at the Panama-Pacific Exposition grounds, San Francisco, Nov. 1 to 8, Manager Gordon H. True has planned to make it a general utility show of food producing animals, planning classes which have heretofore not been included in California shows. Some of the features of the dressed rabbit and poultry exhibits are different from anything in previous shows.

In addition to the $36,000 in premiums many breed associations, as well as others, have put up attractive prizes insuring a fine showing of cattle, horses, sheep, swine and poultry. Among the added premiums are the following:

American Shorthorn Breeders' Association, for beef classes, $1500 and $500 for milking Shorthorns; American Hereford Breeders' Association, $500; American Aberdeen-Angus Association, $500; Brown Swiss Cattle Breeders' Association, medals; Percheron Society of America, silver medals and ribbons; Shire Horse Society of England, silver medals; National Spotted Poland-China Record Association, $100; Western Berkshire Congress, $200; Western Meat Co., San Francisco, for junior hog feeding classes, $100; American Hampshire Sheep Association, $42; American Shropshire Registry Association, ribbons; The Emporium, San Francisco, for beef and dairy cattle, $250; California Central Creameries for the best grade cow, with record, by registered bull, $225. For rabbit classes there are 74 cups offered.

Entries close in the live stock division Ocober 1, except carload steers, which may be entered up to October 18; and rabbits and poultry, October 20; and dairy products to 6 p. m., October 30.

Particular attention is being given to the carload lot exhibits at this show, not only among market animals but brteding animals as well. Carload prizes are offered for registered beef bulls and heifers for breeding purposes; feeder cattle, fat cattle, carloads sheep and market hogs. Ample space will be provided for quite a complete showing of these carload classes as they will attract some of the largest meat producers in the West.

CALIFORNIA BREEDERS MAY SHOW AT CHICAGO

Gordon H. True of the University of California and at present manager of the California International Livestock Show is making an effort to arrange for a number of California breeders to attend the International Livestock Show to be held in Chicago the first week in December.

True says that a number of California breeders are seriously considering sending exhibits to Chicago. Among those who will probably enter the Eastern show are: Easton & Ward, Shire horse breeders; Thornton S. Glide, owner of the sensational two year old Shorthorn heifer, Little Sweetheart, grand champion at the recent state fair; John A. Bunting, Hereford breeder of Mission San Jose; the Estate of Thos. Dibblee, Shorthorn breeders of Santa Barbara and the Ormondale Company, Shorthorn breeders of Redwood City.

It is True's idea that such enterprise on the part of California live stock interests would mean much to the industry of the Pacific Coast and he is hoping that perhaps enough breeders other than those who plan to show to charter a special car will join the plan.

WRONG DATE

In our issue of September 20, on page 388, the ad of Fred D. Ross, Hanford, gave date of October 11. It should have been October 7.

Arizona's wool clip for 1919 has been estimated by the Phoenix Chamber of Commerce at 5,000,000 pounds. On January 1, 1919 Arizona had approximately 1,400,000 sheep.

Buy wisely what you really need now and save the rest in Thrift and W. S. S. for a sunny opportunity.

AGEE BROS. PUBLIC SALE

50 - Registered Holsteins - 50

Harold Bell Wright Ranch, Meloland, Imperial County, California

Wednesday, October 8, 1919

Having leased their ranch at Brawley, Agee Bros., owners of the well known, high class PARAGON HERD of registered Holsteins, will sell 50 head of highly bred individuals from their herd at public sale.

Females in the Offering

The sale will contain well bred cows and bred and open heifers. Most of the females are of breeding age, and are bred to TOYON FAYNE VALDESSA, whose sire is the 41 pound bull King Valdessa, and whose dam is a 30 pound 4 year old daughter of King Hengerveld Aaggie Fayne. He is one of the most richly bred bulls in California and his calves from these dams will be worth all the dams bring in this sale.

A Rare Offering of Bulls

Dairymen and breeders of the south have rarely been offered so good an opportunity for the selection of a well bred herd bull as will be afforded in this sale. Practically all of these bulls are sired by TOYON FAYNE VALDESSA, and by a grandson of De Kol of Valley Mead, dam of King Mead of Riverside, the only bull of the breed whose entire list of yearly record daughters average over 4 per cent butterfat on yearly test, among them Aaggie Acme of Riverside 2nd, the world's official yearly record cow. These bulls are out of some of the best cows in PARAGON HERD and many are about ready for service.

Don't Overlook the Fact

that a large percentage of the females are great granddaughters of King of the Pontiacs, the breed's greatest sire of producing daughters, and that practically all of these are bred to a 30 pound son of the 41 pound bull, King Valdessa.

Every Animal Guaranteed to be a Breeder **No Animal in Sale is Tuberculin Tested**

The Harold Bell Wright Ranch is one-half mile from Meloland, Imperial County, on the El Centro-Holtville Road. Parties coming by train get off at El Centro, where auto conveyance to sale will be provided.

THE SAN JOAQUIN POLAND-CHINA BREEDERS' SALE

The first sale of Poland-Chinas to be held by the San Joaquin Poland-China Breeders' Association was held in Lodi, September 19.

There were some misgivings, by a number of the breeders, as to the outcome of this sale as it was mostly advertised as a boar sale and the first of its kind to be held in the state. The results of this sale offer conclusive proof that the time is ripening for the holding of boar sales in California. Fifty-two animals were catalogued, of which only eighteen were sows or gilts. The sows averaged $153 and the boars averaged $90. The top for both boars and sows was $300, Governor, a boar from the herd of Geo. V. Beckman and Sons, by Matchless Big Bob, going to Langhorst Bros., Lodi, and the sow Orange Blossom, by Ursus Jr., consigned by Eugene Miner, went to H. I. Marsh, Modesto.

The breeders are highly pleased with the results of this, their first sale, and announce that they will hold a bred sow sale about the twelfth of February, 1920. Ord L. Leachman of Sacramento cried the sale. Following is report of sale in detail:

CONSIGNMENT OF GEO. V. BECKMAN & SONS

1—Boar, Langhorst Bros., Lodi, $300.
2—Boar, C. L. Villingu, Lodi, $75.
4—Boar, Les McCracken, Ripon, $50.
6—Sow, Les McCracken, Ripon, $250.

35—Sow, E. McKinley, Lodi, $180.

CONSIGNMENT OF YOUNG & CLARK

38—Boar, A. M. Cooper, Turlock, $70.
44—Boar, Diamond Ranch Co., Red Bluff, $85.
45—Boar, Diamond Ranch Co., Red Bluff, $90.
47—Sow, H. T. Bailey, Lodi, $150.
48—Sow, Diamond Ranch Co., $70.
49—Sow, Diamond Ranch Co., $70.
50—Sow, C. E. Stender, $95.
51—Sow, C. N. Adams, Galt, $90.
52—Sow, N. K. Horan, Lockeford, $160.

THE HAAG AND BERNSTEIN SALE OF POLAND-CHINAS

The highly satisfactory sale of Poland-Chinas held in Hanford by W. L. Haag and Son and John M. Bernstein September 17, set a new high average for the breed in the state. Thirty-six sows and gilts, five young boars and one club pig were sold for the fine average of $189.41 for the sows and gilts, $2.50 for the boars and the club pig brought $125. This pig was consigned to the sale by Mr. Bernstein's little daughter, Mary Eva Bernstein. The top from the herd of Haag and Son was Maid's Big Bone Orphan by King's Big Bone Leader and bred to Young Jumbo selling to Les McCracken of Ripon for $505. From the Bernstein herd the top was secured in Miss Smooth Wonder by Mouw's Black Wonder, sold open with the breeding privilege to The Yankee, Jr., Thos. Caesar of Reedley securing her for $570.

It was the universal opinion of many of the breeders present that the animals in this sale were the highest class ever sold at public sale in the state. While a number of the animals sold for less than their value, the high average made shows a healthy condition and should be a source of much satisfaction to other breeders who will hold sales in the future. Following is a dctailed report of the sale. H. M. Bernstein was the auctioneer.

W. L. HAAG & SON CONSIGNMENT

2—Les McCracken, Ripon, $505.
3—Les McCracken, $150.
4—H. I. Marsh, Modesto, $130.
5—E. W. Houston, Hanford, $127.50.
9—Geo. E. Dierssen, Sacramento, $150.
10—C. G. DeRaad, Lemoore, $150.
11—C. G. DeRaad, $100.
12—C. G. DeRaad, $100.
20—Wm. Bernstein, Hanford, $210.
21—W. D. Trewhitt, Hanford, $127.50.
26—C. T. Starr, Hanford, $165.
31—Les McCracken, $137.50.
32—Les McCracken, $137.50.
33—Les McCracken, $137.50.
38—H. D. McCune, Lemoore, $150.
39—E. W. Houston, Hanford, $155.
40—H. I. Marsh, $155.
42—M. Lovelace, Lemoore, $90.
47—A. Piefer, Hanford, $75.

JOHN M. BERNSTEIN CONSIGNMENT

1—Thos. Caesar, Reedley, $570.
6—Harrold S. Waltz, Lemoore, $285.
7—Les McCracken, $80.
8—C. H. Myers, Laton, $75.
16—Thos. Caesar, $402.50.
17—A. Piefer, $127.50.
18—J. M. Case, Lemoore, $165.
19—C. T. Starr, $220.
22—E. S. Myers, Riverdale, $260.
23—Frank Johnson, Hardwick, $160.
24—C. G. DeRaad, $200.

43—C. H. Myers, $100.
44—W. T. Dice, Hanford, $70.
45—Chas. Lewellyn, Hanford, $75.

HENDERSON HOLSTEINS TO MANY NEW HERDS

The combination sale of registered Holsteins held at Stockton on September 18, by the Henderson Holstein Company of Sacramento and the Bonita Stock Farm of Lodi resulted in the distribution of 56 head of bulls and females at prices that are certain to make money for the purchasers.

This was the first sale of Holsteins to be held at Stockton and that fact together with the early date no doubt held values to a lower level than would be expected later in the fall. Few sales have been held where the offering went into the hands of as many men making their first start with purebreds and from that point the sale can be regarded as an important event in the development of the industry in the upper San Joaquin Valley.

The top price paid for a cow was $490, at which figure N. K. Horan of Lockeford secured the good young cow, Baby Lyons Tiffany. J. W. Scudder of Holt bought the top bull, Model Domino Glista, at $425. Forty-seven cows averaged about $275.

Among the heavier purchasers were F. L. Harvey of Galt; N. K. Horan of Lockeford; Geo. P. Robinson of Sacramento, and R. L. Holmes of Modesto.

The sale was under the management of The California Breeders' Sales & Pedigree Company of Sacramento. Ben A. Rhoades of Los Angeles was the auctioneer and Geo. A. Bell of Tulare acted as ringman.

A detailed report of the sales follow:

62—Manteca Walker Model Segis, Mar., 1918; F. H. Harvey, $200.

PRESTON AYRSHIRE HERD DISPERSED

The first sale of registered Ayrshires ever held in California was made by the Preston School of Industry of Ione, when the entire herd owned by that institution was dispersed at the state fair grounds, Sacramento, September 16.

The sale disclosed a widening demand for this Scotch dairy breed and while the number of buyers attending the sale was small the offering was absorbed with little trouble. As a whole he values that obtained ruled conservative.

F. H. Faye who is establishing a herd near Grafton and W. H. Frey of La Honda were the largest purchasers. The Penobscot Farm near Cool, El Dorado County, secured a number of the choicer lots.

The sale was held under the management of the California Breeders' Sales & Pedigree Company of Sacramento, and Ben A. Rhoades of Los Angeles was the auctioneer.

A representative list of sales follows:

BULLS

1—Preston Premier, June, 1917; O. L. Shafter Estate, Inverness, $170.
2—Steybrae Masterpiece, Aug., 1916; Shafter Estate, $150.
42—Preston Prince Master, Oct., 1918; Shafter Estate, $65.
43—Preston Ravendale, Feb., 1918; Shafter Estate, $130.
44—Preston Prince Bangles, Nov., 1917; Shafter Estate, $160.
45—Preston Masterpiece, Jan., 1919; Shafter Estate, $125.

FEMALES

3—Lady Douglas of Steybrae, Nov., 1915; H. P. Faye, Grafton, $335.
6—Millie Preston, Nov., 1917; Geo. W. Frey, La Honda, $105.
7—Preston Princess, April, 1918; Geo. W. Frey, $105.
8—Preston Nellie Osborn, April, 1918; Penobscot Farm, Cool, $190.
9—Cedar Hill Queen, Sept., 1915; H. P. Faye, $400.
10—Steybrae Ruby, March, 1916; H. P. Faye, $150.
11—Cedar Hill Jean 2d, Aug., 1916; H. P. Faye, $160.
13—Cedar Hill Pet, April, 1915; Geo. W. Frey, $185.
14—Cedar Hill Kate, March, 1915; L. M. Boyce, Sacramento, $125.
15—Beaver Meadow Lassie, Feb., 1914; Mrs. Eugenie Hughes, Sacramento, $190.
16—Cedar Hill Dandy, March, 1915; Penobscot Farm, $140.
17—Terrance Bank Gay Lass, Dec., 1912; H. P. Faye, $300.
18—Cedar Hill Mayflower, March, 1915; Geo. W. Frey, $180.
19—Cedar Hill Viola, Nov., 1913; Penobscot Farm, $260.
20—Cedar Hill Princess, Sept., 1915; Penobscot Farm, $200.
21—Preston Princess 2d, May, 1919; Geo. W. Frey, $75.
22—Cedar Hill Millie, May, 1913; Geo. W. Frey, $300.
23—Cedar Hill Nellie Osborne, Oct., 1913; H. P. Faye, $300.
24—Cedar Hill Doris 2d, Sept., 1915; Geo. P. Robinson, $115.
26—Queen of Steybrae, May, 1914; H. P. Faye, $200.
27—Ravensdale Doreen Sept., 1915; Penobscot Farm, $310.
28—Cedar Hill Dew Drop, Nov., 1914; C. C. Perkins, Perkins, $170.
29—Beauty of Steybrae, Jan., 1916; Geo. P. Robinson, $110.
31—Soncy Maid of Steybrae, Sept., 1915; Geo. W. Frey, $305.
32—Preston Soncy Maid, May, 1919; L. H. Wilson, $50.
33—Jean Douglas of Steybrae, Oct., 1915; H. P. Faye, $225.
35—Cedar Hill Lady May, Sept., 1913; F. E. Howard, Sacramento, $160.
36—Preston Dandy, Aug., 1918; L. H. Wilson, $95.
37—Preston Doris 2d, May, 1918; L. H. Wilson, $65.
38—Preston Mayflower, Aug., 1918; A. Bloom, Petaluma, $95.
39—Preston Dew Drop 3d, Aug., 1918; L. H. Wilson, $95.
40—Preston Dew Drop 2d, Oct., 1917; W. E. Bullack, Oakland, $110.
41—May Preston, Nov., 1917; Geo. W. Frey, $210.

PLANS FOR SAN FRANCISCO SHOW

The construction of the big arena in the California building at the Panama Pacific Exposition grounds, San Francisco, has been started so that it will be in readiness when the California International Livestock Show opens on November 1st. This will seat upwards of 5000 people and have a ring large enough for the showing of horses in action, a nightly horse show having been included as part of the program. Pens and stalls will be built for 1000 head of livestock inside of the building, with carload lots in covered pens on the outside.

Every inch of the spacious California building will be devoted to the show, some 16,000 square feet being used for exhibits of dairy and barn equipment. In order to construct a show ring in which heavy horses can be shown in action, it will be necessary to lay at least an inch of clay and four inches of tan bark on the wooden floor of the building.

The poultry and rabbit show will be arranged in the balconies surrounding the big livestock exhibit in the large pavilion room.

Room will also be provided for barn and dairy appliance exhibits. This unique feature of the show will not only be instructive to farmers who are particularly interested in these modern appliances, but will be of great educational value to city people who have little or no conception of the modern and sanitary equipment used by progressive farmers .

The inquiries for premium lists indicate that the show will be made up of herds and flocks from all Pacific Coast states as well as a number from the Middle West and Rocky Mountain regions.

The Rosedale Stock Farm, Eugene, California, reports having received a select shipment of Hampshire sheep. Included in the lot were a number of extremely high class selections made from the leading flocks of England by Robt. S. Balstock. The English flocks represented are those of Judd, Ishmay and Williams. The American flocks contributing to the shipment are Butterfield, Detweiler and Howland. Twelve yearling ewes were sired by the $1600 Detweiler ram.

Yes, the world owes you a living, but you will starve to death if you sit down and wait for it to come round and settle.

Pork Production

By Actual Test Pure Hawaiian Cane

MOLASSES

will increase pork production approximately five-tenths pounds daily over a barley and tankage feed, yet it sells for less than half the price. Do you know of any other feed at any price that will do this?

Why not get all the profits out of your hogs?

Write us immediately for a copy of above test.

BIG TYPE, POLAND CHINA DAY

BIG TYPE POLAND CHINAS

Trewhitt, Vaughn and Nehls Sell Big Type Poland Chinas

This sale, as it should, will attract buyers from all parts of the west. And why shouldn't it? No such offering of Big Type Sows and Gilts has ever before been offered at Public sale on the Pacific Coast.

This Kind Sells

BIG TYPE POLAND CHINAS

70 --- Bred Sows and Gilts---All Big Stock---Sell --- 70

This is one of the most important offerings of bred Poland-China sows and gilts ever held on the Pacific Coast. All bred to some of the outstanding boars of the breed. What this means to the young breeder just establishing a herd—what this means to the old breeder already established—cannot be measured. You can purchase at your own price, bred Poland-China sows and gilts, strictly Big Type.

The long, big, deep, smooth, motherly kind you have always desired.

This is the sale worth waiting for—the sale worth going miles to attend.

Owing to the number of high class animals to be sold the sale will start promptly at 10:30 A. M. Lunch at noon. Geo. W. Bell, Tulare, will be the auctioneer. Address for catalog any of the consignors, at Hanford.

W.D.Trewhitt--C.A.Vaughn--G.H.Nehls

Make Up Your Mind Now

To Attend the Poland-China Sale of

Bassett, Crawshaw and Ross

Tuesday, October 7, Hanford, Calif.

From these three herds there has been selected animals whose sire and dam have been an important factor in building up Poland-Chinas in California. You cannot fail to be impressed with the individuality of the animals offered and what may you expect when they are bred to such boars as KING'S TIMM, MODEL FELLOW, JR., BIG TIMM and SOME PRICE.

75 head in this sale including a few herd boars.

Every animal immunized. You'll be there of course.

Address Fred Ross, Hanford, for catalog.

ELBERG TO SELL HIGH CLASS SHORTHORNS

Shorthorn interests of California are looking forward to the sale announced by H. M. Elberg, proprietor of the Roselawn Stock Farm, Woodland. The sale will be held at the farm adjoining Woodland, Thursday, October 16, and will include some of the best Shorthorns to be sold in the West this fall. The Roselawn herd has been before the public for near 30 years and has always been regarded as one of the choicer collections of the breed owned in the West. Breeders are especially interested in the offering of the herd bull, Crescent Dale, regarded by many as one of the top bulls owned in this state. The reason that breeders will have an opportunity to appraise him at auction is due to the fact that the sale is made necessary in order to reduce the herd to a point that will permit it being handled on smaller acreage. Consequently fewer females will be maintained and the service of two bulls will no longer be required. Besides Crescent Dale a number of younger bulls will be sold.

The females to be catalogued include a large number of really outstanding matrons that will attract the better buyers. It is thought that the sale of Mischief E 3d constitutes the first time that a California state fair grand champion has ever been offered at public sale. She was champion at the 1918 show and it is of interest to know that she is the dam of Roselawn Champion, junior champion at the same show.

Another extremely popular female is the white junior yearling heifer, Rosie Mayflower, a daughter of Sultan Mayflower, the famous herd bull owned by the University Farm and therefore a half-sister to the champion Shorthorn steer of 1918 and California Model, the highest priced Shorthorn bull ever sold at auction on the Coast.

The offering is made up largely of Scotch breeding, with a number of highly desirable Scotch topped individuals.

A recent inspection of the cataloged lots leads to the conclusion that the sale will be one of the most attractive yet held in this state. The sale will be under the management of C. L. Hughes of the California Breeders' Sales & Pedigree Co., Sacramento.

CALIFORNIA AT THE NATIONAL DAIRY SHOW

A number of California live stock men and creamery men are on their way to the National Dairy Show to be held in Chicago, October 6-12. Still better, some of California's stock and dairy products will be exhibited. Some of the University of California stock will be exhibited at the International and here's hoping it will bring home the money from those exhibits.

Meantime, Dr. Maynard Rosenberger of Los Angeles has been busy gathering together exhibits of California produced milk. He shipped on Monday, September 22, 36 entries. These consisted of 27 exhibits from regular market milk guaranteed or certified. These exhibits are expected to arrive ready for judging on September 29, though all awards may not be announced until opening day, October 6.

To the ordinary dairyman it may appear remarkable that exhibits of milk may be shipped across the continent without any preservatives whatever, other than ice, and be ready for competition with nearby produced milk and stand a reasonable show of making a winning. We may add, however, that there are fewer of "ordinary" dairymen than a few years ago, and California is an example of extraordinary work on the part of her producers.

DIAMOND BAR DUROCS

On May 24th W. T. Gatton of the Diamond Bar Ranch, Spadra, Los Angeles County, returned from a buying trip through Iowa and Nebraska, bringing with him 74 head of pure bred Durocs which, added to the already strong herd, serves to place this fine breeding herd right at the head of the procession. The matter of price stood not in the way when the animal and the blood lines suited. The public is henceforward invited to pass judgment on the herd any and every day in the year. About 325 spring pigs are to be selected from by prospective buyers. These pigs represent the get of the big boar California's Great Wonder, the 1918 grand champion and a good son of Orion Cherry King 5th. Here also may be found high class sows, mated to best boars of the breed, and fit material for founding high class breeding herds. The judge's awards at Sacramento indicate that Mr. Gatton turned the right trick in selecting animals that will stand the test of the expert as to type and high individuality. Twenty ribbons fell to the credit of the Diamond Bar exhibit, including some of the highest honors within the gift of the state fair association. The great junior yearling boar, Mammoth Sensation 2d, easily won 1st in one of the finest classes ever seen at a Pacific Coast live stock show. One of the real sensations of the show was seen in the outstanding under year sow, Pathfinder's Very Best. The Diamond Bar show herd will be seen at both Riverside and Los Angeles live stock shows.

HIGH QUALITY HAMPSHIRES

From a select foundation laid about two years ago C. J. Gilbert has built up a very substantial herd of registered Hampshire swine at Lancaster. A $3000 hog house marks the enterprise as one that is to stay. The herd boar is the big three year old, The Harvester Again. He combines good length with excellent bone, fine feeding quality, and unusual display of breed character. Some of the leading brood sows are Wavelet, Mary Pickford, Leading Wave 3d, Second Echo, True Quality, Gilbert's Pride and Lancaster Queen.

Wavelet may be recalled as the outstanding senior yearling sow at Liberty Fair. She is extremely large for age, has a back that will never dip and carries great depth of body withal. She is a daughter of Conejo Chief. Mary Pickford is another by same sire. She was 1st in aged sow class at both Sacramento and Los Angeles, 1918, while Leading Wave 3d stood in third place at both shows.

True Quality is the dam of the litter of ten perfectly belted pigs seen at Liberty Fair, the get of Duke's Allen. Since that date she has farrowed litter of seven by a son of Duke's Allen—all with perfect beltings. Four of these young sows are reserved for the home herd. Three sows and one boar from the older litter are to figure as the Gilbert young herd, get of sire and produce of dam. The Gilbert show herds will be seen at Lancaster, Riverside and Los Angeles.

100 Registered Holsteins 100

at Public Auction

Thursday, October 30, 1919

Ripon, California

On the C. A. Miller Ranch, 6½ miles northwest of Ripon, 13 miles southeast of Stockton, on French Camp Road.

Contributors to sale:
C. A. MILLER, GOTSHALL & MAGRUDER, and H. A. DeWOLF, all of Ripon.

In this sale C. A. Miller will sell his entire herd with the exception of two cows and a few heifer calves; Gotshall & Magruder will sell 30 head of choicely bred cows, heifers and bulls; H. A. DeWolf will sell 20 head of highly bred young cows, nearly all with good A. R. O. records, and some extra well bred heifers. This sale will contain:

A. R. O. Cows with records up to over 28 lbs. butter in 7 days.

Heifers from A. R. O. dams with records up to over 32 lbs. butter in 7 days.

Splendid cows and heifers bred to a 33 pound son of King Mead of Riverside.

Daughters of Sir Veeman Korndyke Pontiac, 30 pound son of Sir Veeman Hengerveld.

And sons or daughters of these richly bred bulls: Prince Gelsche Walker; King Korndyke Pontiac 20th; It; Sir Segis Walker; King Segis Pontiac Jannek; King Lillian Walker Segis; Arcady Pontiac Wayne Hengerveld; Sarcastic Legislator; Prince Aralia Walker; Nudine Butter Boy; King Morco Alcartra; Prince Gelsche Walker 11th; Moorland King Mead Haskins; Colantha Sir Pontiac Aaggie; King Paul Korndyke Vale; Sir Segis Walker.

Every animal guaranteed to be a breeder.

No animal in sale is tuberculin tested.

Catalog free on application.

Feeding for Eggs

By Jean A. Koethen

BREEDING, cullIng and feeding are the three consecutive steps in the development of the high producer. There is no profit in feedIng expensive grains to a hen that is not properly bred, and some hens that have the breeding which makes for egg production still fail to deliver the goods and must be culled out and consigned to the pot. When all has been done that can be done to provide a perfect egg machine, there is still one thing left and that is, to provide the materials which the machine is to transform into bone and muscle and meat and eggs.

The feeding of a laying hen has two purposes, two distinct aims. In the first place, her bodily functions must all be maintained. She must be reasonably well covered with flesh, her muscles must be renewed as they wear out from week to week, she must be kept warm on cold nights. The portion of her ration which provides for bodlly maintenance is, generally speaking, the scratch feed or hard grain ration. This should be about half the whole ration, or perhaps, during the season of heavy production, a little less than half.

Hens that are fed on grain alone incline to become too fat for egg production, for the grains are high in starch and fatty content and low in protein. Wheat, the best of all grains for egg production, contains only about one part protein to six or seven of carbohydrates. Oats are about the same. Barley is one part protein to about eight of carbohydrates, while Indian corn is one part protein to eight and a half of carbohydrates. As the best ration for egg production should contain one part protein to four and a half or five of carbohydrates it is easy to see that grain alone will not do. Protein must be added in some form or other.

The Balance of Ration

Just a word about protein. Nobody can define it exactly. It is something that cannot be separated and put off by itself as one might separate acids or salts. We know in a general way that it belongs to a group of substances which contain a good deal of nitrogen, but protein is not exactly nitrogen. Lean meat contains a large amount of protein, so does skimmilk, so does an egg. Beans and peas contain a good deal. The common dry bean is about one-third protein. The soy bean is half protein. Flaxseed is one part protein to four of carbohydrates.

I like the way Professor Dryden of the Oregon Station explains the need of protein feeds in egg manufacture. "An egg," he says, "contains one-quarter ounce of protein. If the hen be fed on wheat and nothing else she may eat four ounces per day. Of that she will need about three ounces to supply bodily needs. This leaves one ounce to make eggs with. In an ounce of wheat there is about one-tenth of an ounce of protein. Now, supposing the protein is all digested, which is not the case, she won't get enough protein to make half an egg a day. But an egg every two or three days wouldn't be so bad at certain seasons. The egg, however, contains other things. It contains also about one-quarter ounce of lime with which to make the shell. An ounce of wheat contains less than one-tenth as much as one egg contains. The egg also contains fat. It contains less than one-quarter ounce of fat, but the wheat would contain three-quarters ounce of fat formers."

The ration which contains all the elements necessary both for bodily maintenance and egg production is a balanced ration. It may consist of many ingredients or few but it should contain approximately one part protein to every four and a half or five parts carbohydrates and fats. Protein may be supplied by the addition of one of the meat meals, by fish meal or milk, soy bean meal, linseed meal, peanut meal, sunflower seeds, or any of several vegetable meals. Experiments at Davis showed that while linseed or soy bean meal may be used to supply part of the protein content of the mash, it cannot satisfactorily replace the meat meal altogether.

Value of Milk

Milk is the only protein food that has so far been found that can satisfactorily be used in place of beef scrap or fish scrap. At the Connecticut Station, during the egg-laying contest of 1915-1916, this experiment was tried with five groups of two pens each, consisting of Barred Rocks, White Wyandottes, Rhode Island Reds, White Leghorns and Light Brahmas. One pen in each of these five groups was fed the regular contest ration, the other pen in each group was fed in precisely the same way except that the beef scrap and fish meal were withheld and sour milk was used in their stead. In four of the five pairs of pens, the hens that had sour milk laid more eggs than those which had the regular ration containing beef scrap and fish meal, and the milk fed Barred Rocks distanced the meat fed Barred Rocks by 700 eggs. The meat fed R. I. Reds laid 250 eggs more than the milk fed, but the difference is laid to other causes than the ration.

Many California poultrymen use both beef scrap and milk, keeping the dry mash containing beef scrap before the hens constantly, and in addition moistening it once a day with sour milk or buttermilk. This method of feeding seems to have originated at the Missouri station, where it was successfully practiced for some years.

"I would never hatch another chick without one"

says John F. Forney, a successful poultry raiser of Kingsburg, Cal., "—if I could not have all my machines equipped with your regulator. The heat does not vary one-fourth of a degree during the last three or four days. Its action is almost human." Many others write us about the

CHARTERS REGULATOR

(Readily attached to your incubator. Part of the equipment of Charters Incubator.)

How it works:
It's the two thermostats that do the trick, one outside and one in the egg chamber, actually anticipating any change of temperature and automatically adjusting the size of the flame. The temperature outside may vary as much as 70 degrees, without producing as much as half a degree of change in the egg chamber. With the Charters you will not need an incubator cellar.
The big tank holds a fuel supply capable of running the lamp from 2 to 3 weeks. That means only one refill and trimming of the wick a week.

P. R. Lyding of Sebastopol, with twenty-six years of incubator experience, writes: "Your Regulators complete are absolutely the best I have ever used. I installed them myself—and can feel sure when machines are hatching, if unwatched, temperature will not vary to exceed one-half of a degree."

J. H. Stubbe, of Palo Alto, writes: We need not give the lamps any thought at night. The Regulator takes care of any changes in temperature perfectly. It is certainly a relief."

Many big hatcheries operating upward from one-hundred machines, are discarding all others and using Charters Regulators and Incubators exclusively. Owners of only one machine are finding the Charters Regulator a treasure.

Write today for free catalogue—or better still—let us have your order now, for your Charters. The Regulator is $10; the Incubator (equipped with Regulator) is $65.

Remember: If the Charters Regulator and Incubator do not do what we claim for them—your money back.

See The Charters at principal fairs and poultry shows this year.

DR. HESS Instant Louse Killer Kills Lice

For Use On Your Poultry

Seize the hen and dust Instant Louse Killer into the feathers. The handy sifting top can makes it convenient to use. Sprinkle it in the nests, on the roosts and floors. Put Instant Louse Killer in the dust bath occasionally—your hens will do the rest. This means louse prevention.

FOR STOCK

With one hand stroke the hair the wrong way, with the other sift in the Louse Killer. Especially good for lousy colts.

GUARANTEED. The dealer will refund your money if it does not do as claimed.

Eggo-O-Latum Keeps Eggs One Year

It costs only one cent per dozen eggs to use Egg-o-latum. There is no other expense. Eggs are kept in carton or box in cellar. Eggs may be boiled, poached or used in any other way, just like fresh eggs. Simply rubbed on the eggs—a dozen per minute. A 50c jar is sufficient for 50 dozen eggs. At Drug, Seed and Poultry Supply Stores or postpaid.

Eggs on a Grain Ration

F. W. Wenzel, a Wisconsin poultryman, has recently published the results of an experiment in which his flock was fed during the winter a ration of oats, barley, corn and mangel beets, without any mash whatever. His hens averaged 14 eggs in January and 13 in February, which is quite up to that of most commercial flocks. He found, however, that the eggs were smaller than usual and fertility doubtful, though not more doubtful than in many mash-fed flocks. His hens were also inclined to be over fat. Comparing his findings with those of the Purdue station, where a pen fed on skim milk averaged 140 eggs; a pen fed on beef scrap 136 eggs; and a pen fed a ration containing neither milk nor meat 61 eggs, Mr. Wenzel thinks there must have been some other factor at work in the Purdue flock than difference in feed.

As the animal portion of the ration is considerably more expensive than the grain portion we should be fortunate indeed if an all-grain ration could be devised which would do away with the use of meat and milk but no such ration has as yet been found. Experiments at Davis have proved that if a little meat meal is good, much is no better. I have not the figures at hand but if I remember correctly, the investigators found that 15 per cent of animal or animal and vegetable meal was necessary to best production, but that this 15 per cent might be half meat meal and half vegetable meal without affecting production, and that there was no increase in production when a greater amount of meat meal was used.

Some Good Mash Formulas

There are thousands of good mash formulas, probably one for every experiment station and successful poultryman, for they all have their hobbies. Perhaps it does not so much matter just what is in the mash if only there is a variety. At the Vineland international egg laying and breeding contest this ration was used:

Scratch Feed

Cracked corn	100 pounds
Heavy oats	100 popnds
Feed wheat	100 pounds

Mash Feed

Wheat bran	100 pounds
Wheat middlings	100 pounds
Corn meal	100 pounds
Ground oats—heavy	100 pounds
Meat scrap—high grade	100 pounds

At this contest the amount of scratch feed per 100 hens daily varied from 12 pounds in November to five in August. From November to March there was a noon feeding of two pounds, with a morning feed of two pounds and an evening feed of eight pounds. During the other months grain was fed only morning and night.

At the Storrs egg laying contests the mashes and scratch formulas have been changed from year to year and the later are the more simple. In the fifth contest the mash consisted of 100 pounds each of bran, corn meal, ground oats, and middlings; 50 pounds fish scrap and 50 pounds beef scrap. The scratch grain fed with this consisted of equal parts wheat and cracked corn.

A good mash for Leghorns which was given me by a well-known Leghorn breeder, consists of:

Wheat bran	600 pounds
Ground oats	200 pounds
Sour milk	400 pounds
Darling's beef scrap	200 pounds
Corn meal	300 pounds
Fish meal	100 pounds
Ground bone	100 pounds
Charcoal	25 pounds
Salt	10 pounds

The laying ration used last year at the Davis farm consisted of the following mash:

Bran	5 pounds
Shorts	5 pounds
Meat scrap	3 pounds
Soy bean meal	2 pounds
Ground barley	5 pounds
Charcoal	½ pounds
Salt	1/10 pounds

The scratch feed used with this mash contains 15 pounds wheat, 10 pounds barley and 5 pounds cracked Indian or whole Egyptian corn.

NATIONAL EGG LAYING CONTEST

July report of Eighth National Egg Laying Contest at Mountain Grove, Missouri.

The total number of eggs laid in July was 4853, an average of 16.17 eggs per hen. A pen of Brown Leghorns from Missouri won the cup for July by laying 118 eggs during the month.

The leading pens of each variety for July are:

Brown Leghorns, Missouri, 118 eggs; Red Comb White Leghorns, Missouri, 112; Single Comb Reds, Missouri, 109; Rhode Island Whites, Connecticut, 105; Anconas, Missouri, 105; Barred Rocks, Missouri, 104; White Rocks, Missouri, 102; Single Comb White Leghorns, Missouri, 96; White Wyandottes, Illinois, 94; Silver Wyandottes, Iowa, 93; Buff Leghorns, Illinois, 92; Red Comb Reds, Missouri, 85; Buff Wyandottes, Massachusetts, 82; Black Langshans, Missouri, 73; Black Langshans, Missouri, 73; Buff Orpingtons, Missouri, 61; Buff Orpingtons, Missouri, 61.

The ten leading pens to date are:

Red Comb White Leghorns, Missouri, 944 eggs; Rhode Island Whites, Connecticut, 937; Rhode Island Whites, Missouri, 912; Red Comb White Leghorns, Missouri, 909; White Wyandottes, Illinois, 863; White Rocks, Missouri, 863; Red Comb White Leghorns, Missouri, 856; Anconas, Missouri, 827; Silver Wyandottes, Missouri, 819; Single Comb White Leghorns, Missouri, 811.

Poultry Queries

Conducted by J. A. Koethen

Chicken Tick

We have been bothered with a brownish gray chicken tick about the size of a large pea. These get on the roosts and on the hens keeping them from laying. They were so bad when we came here we burned the old hen house. Can you give me a remedy?—Subscriber, Orizona.

Those ticks are the hardest things in the world to get rid of after they have once gotten a foothold on a poultry ranch. Crude carbolic acid diluted with kerosene (1 part acid to 4 of kerosene) will kill them in the house if you can reach every tick with it. If you let a single one get out of reach in a crack your work will have to be done over again. This insecticide is best applied with a brush, for then you can be perfectly sure that every inch of the wood of walls and roots is touched. There are several cresol preparations and several carbolic acid preparations, such as carbolineum. but they are all much alike. Any of them will kill ticks, I think, if applied thoroughly enough. Corrosive sublimate is the only remedy suggested for killing the ticks that are on the bodies of the birds, and this must be applied very carefully with a brush or the end of a feather, for it might blind either the chicken or the one who was using it if it came in contact with the eye of either. I have an idea that a thorough greasing with lard or carbolated vaseline would kill most of them as it does sticktight fleas, but have never seen it tried. You would have to repeat the greasing several times. If you do not succeed in getting rid of every tick there is nothing to do but to move your chickens to new ground some distance from the old.

Get more winter eggs

The moult is a severe test of a hens strength. It calls on her to supply all her surplus energy and flesh to make feathers. Hens must have a tonic during this critical period, to supply them with more energy, and help them to digest and *use* every ounce of the feed. Make your hens moult properly this year, by giving them

Dr. LeGear's Poultry Prescription
(Powder)

in their feed. This prescription, compounded from my 27 years' veterinary and poultry raising practice, absolutely cuts down the time and strain required for moulting, keeps hens in strong, vigorous condition and insures your getting more winter eggs from your hens. Don't lose profits from high winter egg prices by neglecting your hens during the moult. Try this famous remedy, recommended by thousands. I guarantee that it will help make your hens lay more eggs.

Get Valuable New Book.

FARM LANDS FOR SALE

For Sale—Or part exchange, 140-acre combination ranch; 75 acres as good citrus land as in California, (frostless); walnut and almond and general fruit tree land; 25 to 30 acres fine for alfalfa—practically no water lift. Natural hog pasture, with perpetual water, shade and feed; poultry, turkeys, dairying under perfect conditions. More water than you can ever use practically at surface. Two miles from town, State highway; 12 miles from ocean. This is positively one of the best combination ranch propositions in California. Reasonable improvements in buildings, trees, etc. A large lot of feed now on the place for hogs, poultry, turkeys, cattle, horses—which goes in free. Also farm tools. This property cannot be duplicated in Southern California for less than $300 an acre—and lots of it poorer selling for $400 or more—and before spring you will pay $300 an acre for this. On account of ill health of owner, and dealing direct with him, this property can be had on quick action for something less than $175 an acre; and reasonable terms. If you are ever going to buy land, this is your opportunity. Would take small property, either town or country, as part payment. C. E. HOWLAND, Failbrook, Cal.

Washington "The Evergreen State" has splendid openings for more farmers. Fruit growing, dairying and live stock raising, as well as grain growing show great results. Here is a mild climate, ample rainfall or irrigation and many valleys of fertile soil. Land prices range from $25 an acre upward, depending on location and development. Good roads, schools and churches. Full information in new book by State Agricultural College and United States Railroad Administration, just off press. Ask for Washington book and give your name and address plainly. J. L. Edwards, Manager Agricultural Section, Room 677, United States Railroad Administration, Washington, D. C.

200-ACRE MISSOURI FARM
$5,500, WITH PAIR HORSES

9 head stock, complete farming implements, etc., near R. R. town, high school, creamery, churches, etc.; 40 acres rich bottom land, 40 acres bench or 2nd bottom, balance fine tillage; much wood, saw timber, several acres orchards; 6-room house, barns, corn house, granary, etc. Aged owner to sell at once includes personal property and makes low price, $5,500 for all; easy terms. Details page 88 big 100-page Fall Catalog, just out; farm bargains Maine to Florida and west to Nebraska; copy free. STROUT FARM AGENCY, 831 A. G., N. Y. Life Bldg., Kansas City.

For Sale—140 Acres on proposed highway in Anderson Valley, Mendocino County. Nice open land, no rocks or stumps, all but 30 acres can be cultivated, 7 acres bearing orchard mostly prunes, 60 acres hay land, large garden, balance good pasture, fenced and cross fenced, hog tight, plenty of soft water, 20 buildings including fine 10-room house and large store. Price for ranch, goods and fixtures in store $18,000. Will sell hay, grain and stock cheap. Am sick, must sell. Terms. R. F. Smith, Philo, California.

For Sale—341 Acres A-1 Land; 125 in alfalfa, 75 ready for alfalfa, 85 in corn (soon ready for alfalfa), 15 in pumpkins, 20 in pasture. 6-room dwelling—old, and a small dwelling. Good horse barn, new dairy barn for 60 cows, six horses, 100 hogs and pigs. Water piped to six fields. Plenty irrigating water from Kern River. All necessary implements. Price $50,000, $12,500 cash will handle it. J. B. McCutchen, R. F. D. No. 3, Bakersfield, California.

Mountain Ranch For Sale 196 Acres—60 acres high grade fruit land, 50 acres suitable for grain, balance good grazing land, $3000 worth of uncut wood on the place. About 20 acres cleared, 12 acres fenced and partly planted to fruit trees. Plenty of water. Four-room board house, small barn, storehouse and pig pen. Price $3700. No agents or exchanges. Address Frank Mason, Badger, Tulare Co., California.

FINE INCOME PROPERTY
Located at Montain View, in the beautiful Santa Clara Valley; a 16-room house divided into apartments; $62.50 a month income; earns over 12 per cent on the investment. Price $5,000. Easy terms. A real bargain. Address D. R. Sperry, 386 Mountain View Avenue, Mountain View, California.

For Sale—Fruit and Poultrymen—It will be to your advantage to write today for information about the Paradise district—deep rich soil—ideal mountain climate. (Above frost and fog.) Electricity and an abundance of pure water.
Choice tracts $100 per acre.
PARADISE LUMBER CO.
Paradise, Butte County, California.

For Sale—Twenty Acres Alfalfa, 26 fine Holstein cows, 1 fine Holstein bull; good pumping plant; good 7-room house; two good cow barns. Fifty tons of alfalfa in the barn. Will sell reasonable. Address S. Stokes, Artesia, California. Phone 7105.

Fine Alfalfa Land Northern Los Angeles County, easy water lift, $55 an acre, one-fifth down. Write for our alfalfa circular. Lippincott Company, Fay Bldg., Los Angeles.

For Sale — $1200 Relinquishment — 160 acres with well 114 ft. Water stands 28 ft. of surface. Deeper drilling would doubtless get flowing well. A. C. Vestal, Wagner, California.

WEBSTER, WEBSTER & BLUETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents

SHEEP

Sheep For Sale—Young Merino and Rambouillet ewes; North California Stock. Apply, write or wire ANDREW H. McINNES, wool and sheep broker, 408 Bank of Italy Bldg., 550 Mont. St., San Francisco.

GOVERNMENT LAND

300 Million Acres of "Free" land in U. S. "The New Homeseeker" a 104 page book WITH MAPS and ILLUSTRATIONS, showing millions of acres of vacant public homesteads, timber, mines or grazing lands. Founded on historical facts. DOES NOT MISLEAD. Read warnings "official," eliminates crooked land agents. Tells the whereabouts of government land in Arizona, New Mexico, Nevada, California, Idaho, Oregon, Montana, Washington, Utah and Old Mexico. Describes water, soil and climatic conditions, all the principal U. S. land laws. A marvelous publication, just off the press. Mailed anywhere, $2. Address "THE HOMESEEKER," Dept. M, 3rd floor Grant Bldg., Los Angeles, California.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pruning Young Apricots

How should three year old apricot trees be pruned for best results, long or short cuts?—P. J. M., San Jose.

Cut the second year's growth back to about 18 inches long. When the new shoots start in the spring thin them down to two or three on each limb, but do not take off the fruit spurs. If the trees are past three years old and have been well trained and properly headed back, the next should be a season of building and nothing removed except crossing branches or wild sprouts of unusual growth.

Tomatoes in Orchard

Will tomatoes planted between young orchard trees hurt the trees?—P. J. M., San Jose.

Much depends upon the treatment. If water is not allowed to reach trees when not needed by them, no harm should result. The simple growing of any crop in young orchards is seldom harmful for the first two or three years and is a practice to be commended.

Strawberry Planting

What is the best time to plant strawberries in Butte County? —Subscriber, Durham.

Planting of strawberries is usually done in the winter season or if good vigorous sets are to be had they may even be planted in the fall. The earlier planting secures larger crop the first season but even February planting will give something of a crop during the later months of the following summer.

Water-Proofing Khaki or Duck

Will you please give method for water-proofing khaki or duck. If wax is used is there a particular kind that is best?—Subscriber, Sierra Madre.

Shave very fine paraffin, put in bottle of high grade gasoline, leave in warm place (not hot), shaking occasionally. When positive that you have a saturated solution dip the garment or cloth in it. Saturation is shown when the gasoline refuses to dissolve more of the paraffin.

Pipe for Irrigation

How long will eight inch irrigation pipe with 20 gauge galvanized surface last if placed six inches under the surface of a sandy soil?—Subscriber, Imperial.

It would be impossible to give an idea as to the life of such pipe for it depends on its present condition, how long it has been used as a surface pipe and how well used, and also on the soil as to its corroding. In an alkali soil of course the life would be much shorter than in a sandy soil. Presumably your soil would not contain any great amount of alkali, if it is of a sandy nature, to any great depth. Even if the pipe is new we question the advisability of using it in preference to the regular dipped pipe which will certainly have far longer life under the ground. Our impression is that with present prices of labor it hardly would pay. If, however, the pipe were dipped and carefully driven many years of service might be secured. Regular riveted, dipped, 16 gauge pipe or heavier would perhaps prove the more profitable.

Withered Figs

We have two fig trees five years old on which the figs are not good. All shrivel and turn yellow. The soil has been very dry and I have watered heavily and I thought that may be the trouble. The trees are well loaded.—G. P., Elmhurst.

Your trouble may be due to drought but not to too much water if drainage is good. They may be Smyrna and lack pollenating. Moreover, white figs do not thrive near the coast or in damp climates as do dark and black figs. This year has been a poor one for figs in several sections of the state.

BIG IRRIGATION CONCERN CHANGES NAME

An item of interest to the ranchers, not only of the Pacific Coast but of the entire country, was the recent announcement of the change of name of Kellar-Thomason Company, Los Angeles, to Martin Iron Works. This concern started business in a small way in Covina, California, a number of years ago, but later moved to Los Angeles where they have been manufacturing gates and valves for irrigation purposes—they being the originators of the valve system of irrigating. Several years ago the management of the company was taken over by Geo. C. Martin (from whom the new concern derived its name) and under whose direction it has expanded until the K-T gates and valves are rapidly finding their way to all parts of the civilized world. Irrigators everywhere have come to realize that the old-fashioned, primitive methods are too wasteful and costly for this modern age, and that an efficient up-to-date system like the K-T is absolutely indispensable.

In addition to its complete line of irrigation appliances, the Martin Iron Works is manufacturing concrete pipe machines, concrete mixers, pistons and other machinery, which is extending the scope of its business very materially.

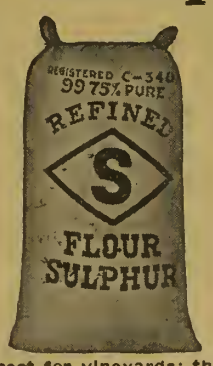
Sulphur



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards SIX times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100 per cent pure, in double sacks, for Dry Dusting and making Paste—(Atomic Sulphur).

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $4 per day for making the solution and applying same.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR 100 per cent pure. This has increased various crops up to 500 per cent.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dry Bordeaux, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 DEGREES BE., Sulphur Paste, Nicotine, Blackleaf 40, etc. Fungicides and Insecticides.

Carried in stock and mixed to order.

San Francisco Sulphur Co.

624 California St. San Francisco, Calif.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET," also booklet "NEW USES FOR SULPHUR", Price-list, and Samples.

Please state for what purpose you use the sulphur, quantity needed, and date of shipment preferred. Telephone Kearny 871.

THE DARK PATH

When people lose their temper
It doesn't always stay
In just the place they lose it,
But travels miles away;
And when they find and bind it
It may be it has done
A mischief never to be healed
Unto the farther sun.

When people lose their temper
It runs and rages far.
It strikes at friends as well as foes,
Not caring who they are;
And when its cruel force is spent,
Its words and deeds go on
Down many ways, through many days
Unreckoned and unknown.

When people lose their temper
It still may come again,
After the past is forgotten,
Bringing a load of pain.
That never can be lifted,
That breaks the heart with woe—
Oh, far the road and ill the path
Where pride and anger go.

—Exchange.

TO THE MEADOW LARK

Hail to thee, my feathered friend,
Little sweetheart of the road,
Joy is in thy heart today,
Happiness that may not end.

Is it from the blue of skies,
Or the water-lilies' laughter,
Or the magic music after,
In the woods that never dies?

Is it from the violets' voice
Or the sweetness of the rose
Or the kiss the pansy throws,
In the which you now rejoice?

Is it in the orchard fruited,
Pear, and peach, and apple clinging,
Where the grape its wine is bringing
And the mocking-bird has fluted?

Little brother of the field,
Who can tell from whence the joy,
Pure and sweet without alloy,
Not a fount of rapture sealed!

I have heard thee in the rain
When no single cloud was rifted,
Yet thy joyous song was lifted,
Waiting for the sun again.

I salute thee, meadow-lark,
Little brother of the road,
Thou hast helped me bear the load,
Singing in the dawn and dark.

—W. L. Childress.

RALPH MASON PLAYS THE GAME

(Continued from Page 395 last week.)

Why should the mighty Gibson want to tackle him, the weakest little lamb of the street? Kate! Kate! that was the only reason big enough to accouut for such a contemptible trick. He recalled that last Masonic ball when she gave him half her dances, although she was Gibsons' guest, and that glare of defiance the fellow had thrown at him as he led her away to his luxurious car. He was sailing high, daring anything, and hoping everything then, but the crash came suddenly bringing him to earth and sending him limping away in shame and confusion.

O! if the gods would only favor his star now! Again he was off in his reveries and the iron greys, thinking of dinner time, turned around and brought him back again to the bustling center. "Hackett's my best bet," he muttered suddenly waking up and jumping out at Packard's office, and after taking their receipt for the fertilizer he closed a deal for 500 barrels at one thirty-five, immediate delivery.

Before nightfall he had concluded contracts for three-fourths of his "Mountains' at the same figure for immediate delivery, and 25 cents less, future, the best offer he could get. There was a slight taint of suspicion already in the air, and the buyers had commercialized it in good Yankee fashion.

Seven days afterwards, Gibson received a wire from a Providence broker, refusing delivery on two carloads and the report spread like the shot that was heard around the world.

And in less time than Hackett's 20 days, King Rot arrived with his billions and trillions of scaly, scabby, slimy minions, and there was uproar everywhere and the devil to pay.

* * * *

"He said I'd be down begging him to take them at a dollar even within ten days!" Ralph Mason was bending over the great bin down in his subway cellar on the side of Greysville Hill, the great rolling fields above wrapped in their garments of beautiful white and the biting blast keeping up its everlasting fret. A buyer had just left making him what he represented as a tempting offer, and he was wondering if he had acted wisely in refusing to trade.

"But Hackett beats it everlastingly into me to hang on. 'When you want to sell the worst that's the time to buckle up,' he says. I wonder, is he absolutely on the square? I wonder why he takes such an extraordinary interest in me?"

For ten weeks the potato business had been absolutely paralyzed but the little metropolis was just as gay as Paris in peace times, throwing itself into all kinds of diversions with its characteristic abandon; dancing, bridge whist, revival services, fraternal society spreads, church suppers, amateur dramatics, horse races and the everlasting movies.

Ralph had received flattering social attention and ventured out again, enjoying the little prestige of his early selling coup. Of course he had met her a number of times although scrupulously avoiding presumption, and it was while swinging around like a fairy to the ever delightful Blue Danube at the hospital benefit, that she lilted the rejoinder which literally swept him off his feet and almost resulted in catastrophe: "You talk about Aroostook girls, Mr. Mason, as if they were the champion freaks, sort of cross between the Amazon and Aphrodite, but they're very much like other girls all the same, just as apt to make fools of themselves for men they like as—as Manhattan girls."

How many times in the weary days of strain and worry up on the lonely hillside had the memory of that thrilling moment come to his relief as first aid against the blue devils, and once again as he stood brooding over the great bin the subtle inspiration shot across his mobile face.

"What would she"—

The interesting query was arrested by the sound of sleigh bells breaking the still air with their merry music on the bend of the hill about half a mile below. He knew there was only one colt on Greysville hills that could take the rise at that sharp clip, and taking out his watch he timed it to the barn in just seventy-two seconds.

Two minutes later Tom Hackett came thundering through the subway door.

"Good boy, Ralph," he sang out, gripping him by the hand and at the same time making a critical survey of the great bin of cobblers. "You've got the stuff all right and hung on to it like a thoroughbred. Now we'll see what we will see.

"Johnson here this morning you say offered one fifteen," he chuckled, "and you told him he'd have to raise it thirty-five? That's the talkin' boy. I knew I could trust you all right without a fire alarm. But you wont' think it presumtuous if I put you on to a trick that's worth two of that—yes two of it to a penny?"

Mason looked at him with a blank stare, arresting the match he was about to strike and holding it up in dumb show.

"I happen to know, Ralph, of a certain gentleman who has a hurry order for 10,000 barrels of the tip top Aroostook Cobbler seeds. He's going to get a fine price for them and for certain reasons I'm going to see that he whacks up on the profit with you.

"O, don't imagine it is any accommodation on my part, sonny," he laughed. "I'm going to have more fun out of it than I had ridin' the tickler at Coney Island. It won't cost me a cent and it will do Dolly V. a whole lot of good. The next time we speed up on the pond I want her to lap the field instead of winning by 200 yards.

"And your part of the transaction, Ralph," he added dropping his voice and seizing him by the shoulders, "is to dose up everlastingly on nerve tonic, for by Kitty Sullivan's black night cap you've got to set the price at three dollars and stick to it till the crack of doom."

As Hackett let go Mason stumbled backward, falling against the cellar upright, and broke into a semi-hysterical laugh. "Three dollars and fifteen hundred barrels!" he gasped. "For God's sake don't be kidding me, Hackett. Why don't you tell me to ask ten?"

"You bet your moccasins I would, boy," puffing as evenly on his cigar as if talking weather, "but if we can't get the porterhouse we'll take the hamburg. Three dollars is the price I've

Somebody asks "What is tannin?"

Tannin is what they tan leather with—pulls it together, makes it tough.

There's a lot of tannin in oak, hemlock—and in cheap coarse tea, but hardly a taste of tannin in fine tea unless you boil it.

Now do you want tannin-flavor or tea-flavor? Do you want to put tannin or tea into your stomach?

Schilling Tea is the fine practical tea with the real tea-flavor—the most economical beverage next to water.

There are four flavors of Schilling Tea—Japan, Ceylon-India, Oolong, English Breakfast. All one quality. In parchmyn-lined moisture-proof packages. At grocers everywhere.

set and if you've got the sand in you, it's just as good as in your pocket.

"And by the way," he added with a droll grin, "I heard one of our little belles remark a few days ago that she didn't care a fig about the dough if she could have the sand."

"You mean, Hackett, that if Johnson should return and offer me two dollars I should turn it down? That would clean up every dollar of my debt and leave me fifteen hundred to the good. You don't really mean it do you?" The wild gleam in his eyes, the trembling lips and the subtle break in his voice touched the big fellow but he did not betray it.

"O, I'm not telling you what you must do, Ralph; you're your own man and will, of course, do as you please, but if I were you I would not feel obliged to give Johnson's boss a present of fifteen hundred. I'd keep it myself."

Before nightfall Johnson returned ready to take Mason up on his dollar fifty offer of the morning and after trying in vain to get him interested in dollar sixty, sixty-five, seventy and seventy-five, went off in a towering rage declaring that he would find some way mighty quick to bust this corner in cobblers.

When the trader touched the dollar seventy-five, watching his game like a panther stalking a rabbit, Mason had started just a trifle but it was only to flip the ash off his cigar and counter: "Nothing doing, Johnson," as cool as Hackett himself, but when the jingle of the sleigh bells died off in the distance he jumped to his feet and breaking into 'Beautiful Lady" like an operatic tenor, started a series of whirling and kicking antics that would have stunted a Russian dancer himself. Coming to a sharp halt against the great bin he threw himself down among the cobblers with the mad abandon of the gold crazed prospector who has suddenly unearthed five hundred dollar dirt. There they lay before him, in tens and hundreds and thousands, in bunches and hills and mountains, glinting and grinning at each other more like Alabama coons than Irish cobblers, every one of the half million seeming to know that something was up and all on the qui vive watching out and ready for the curtain. All through the evening and all through the night he could see them there, winking at each other, giggling and tumbling over each other, in one hilarious mix-up, in one mad frolic, in one grand carnival of unrestrained and endless jollification.

* * * *

Three days later a sleigh of quality behind a jet beauty, going at a two-thirty clip halted suddenly on the edge of the main street jam and the Apollo in furs at the reins took a flying leap into an empty jigger starting the other way.

"Congratulate me Hackett," he shouted, seizing the big fellow's hands and almost forcing a blush. "Congratulate me! I've seen her, and she was waiting for me and just wondering why I was so cool."

"Seen her, you loon!" Hackett grunted, returning the embrace with compound interest. "I thought it was him you were after. How about that deal?"

"Deal? O, the devil, Hackett, I put that through all right and discovered that Gibson was the bear in the trap, and if I live to be 200 I shall never be out of your debt, but it wasn't the money I ever cared a button about, it was a little girl called Kate Langley up on the north road that was my real game all the time. I want you to meet her right away, Hackett. With all your boasting I believe she's the finest thing that Aroostook ever produced."

A wonderful smile blossoming out like a bunch of eidelweiss on an Alpine cliff, startled the young man as he paused and looked earnestly into the big rugged face, but an Aroostook Brahman was not to be caught as easily as that. Digging a monstrous plug of tobacco out of his pocket and taking the lion's bite the big fellow tipped his thumb toward the New York Special puffing on the tracks, as he drawled out:

"I thought you hailed from yonder, Sonny, where everybody knows pumpkins? I wonder you haven't ever heard it remarked 'two can play at that game.' Your little witch, Ralph, has been calling me 'Uncle' for the last 20 years."

Because it has—

1. Doors and splasher back beautifully paneled in *White* or *Blue Enamel*, if desired.
2. All-copper *hot water reservoir;* patented shifting lever controls water temperature.
3. Body of Charcoal Iron; *resists rust* and lasts 3 times longer than Steel.
4. Flues lined with *Asbestos Board*, ¼ inch thick; prevents loss of heat and saves fuel.
5. Air-tight oven; *all parts riveted* together, assures perfect baking.
6. *Large warming closets:* roomy and convenient, with drop doors.
7. No springs on oven door; it is supported with strong, *durable sliding rack*, and holds any weight placed on it.
8. Unbreakable malleable iron; permits rivet tight joints; *saves fuel* and repair expense.
9. First joint of pipe double weight; pipe collar double strength. Front of flue at top and bottom of oven covered with *indestructible malleable iron.* Strongest where others are weakest.
10. Open end ash pan; like shovel. *removes ashes easily*, and cleanly. Ash cup catches ashes that otherwise fall on floor.
11. Cooking top burnished dark blue, *requires no polish.*
12. *Heavy nickel trimmings;* smooth as glass; stay bright, easy to keep clean

There are many other Majestic superiorities. No other range gives you such value for your money.

FOR HARVESTING

Egyptian Corn

You can use both hands and cut twice as much in a day with the

David Heading Knife

as with any other instrument. You cut off the stalk and hold the head with the same hand—and you keep both hands at work, cutting as fast as you can open and shut your fingers. If your dealer cannot supply you send direct to the manufacturer.

Pair (right and left) $2.50, postpaid.

1919 PRUNE, APRICOT AND PEACH PRICES

Prune prices announced by the California Prune and Apricot Growers, Inc., were for the base prices, according to sizes, and are: 20-30s, 22c flat; 30-40s, 16c; 40-50s, 14c; 50-60s, 12c; 60-70s, 11½c; 70-80s, 11c; 80-90s, 11c; 90-100s, 11c. One cent a pound premium will be paid on fruit delivered before September 20. On small-sized fruit 8½ cents a pound will be paid for 100-120s and 7½ cents for 120s and smaller.
Peach prices announced by the California Peach Growers, Inc., for 1919 crop dried peaches for the domestic and foreign trade; September, October, November shipment, seller's option; guaranteed against our own decline until January 1, 1920, are as follows:
Standard yellows, 14¾c; Muirs, 15c.
Choice yellows, 15½c; Muirs, 15½c.
Fancy yellows, 16½c; Muirs, 17½c.
Extra fancy yellows, 17¾c; Muirs, 18¾c.
Slabs, yellows, 14½c.
For "practically peeled" add 1½c per pound (any grade).
Prices above are all bulk basis.
For packing in 50-pound or 25 kilo boxes add 1 cent per pound.
25-pound or 12½ kilo boxes, add 1¼c per pound.
10-pound boxes, add 2c per pound.
Blue ribbon peaches packed 2-pound carons, 12 per case, $10 per case.
Blue ribbon peaches packed 2-pound cartons, 24 per case, $10 per case.
Bakers' special, "practically peeled," 16¾c per pound, bulk basis.

GRAIN AND FEEDS

Oats: Red feed, 2.55@2.90; black, 3.00@3.10 per cental.
Corn: California yellow, 3.65@3.75 cwt., Egyptian 3.15@3.25; Milo Maize, 2.85@2.95.
Rye, 3.15@3.30.
Barley, feed, 2.95@3.00.
Wheat: Following are net weight prices for bulk grain, based on federal standards and grades at San Francisco Bay and Los Angeles terminals:

Hard Wheat—	Per Bushel	Per Cental
No. 1	2.20	3.66 2-3
No. 2	2.17	3.61 2-3
No. 3	2.13	3.55
Soft White—		
No. 1	2.18	3.63 1-3
No. 2	2.15	3.58 1-3
No. 3	2.11	3.51 1-3
Club and Sonora—		
No. 1	2.16	3.60
No. 2	2.13	3.55
No. 3	2.09	3.48 1-3

For sacked grain add nine cents per bushel of 60 pounds to above price. Deduction of three-fourths of a pound is made for weight of standard grain bags. Wheat grading under No. 3 and mixed or smutty wheat will be purchased according to merit.
Mill Feed (per ton): Bran 43.00@44.00; mill run, 42.00@43.00; Rolled barley, 52.00@54.00. Linseed oil cake meal, nominal; cocoanut cake or meal, 41.00@42.00 per ton.

HAY

Under date of September 20, Scott, Magner & Miller says:
Receipts past week 2893 tons. Receipts by rail have been extremely small, cars being scarce in most of the districts.
Wheat hay and Red Oat hay of a fancy variety have been scarce and prices on same well maintained. The market in this city is somewhat slow, most of the large feeders having already laid in their winter's supplies. There is no demand for straw although large lots are being offered.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the Hay Market—for prices to consumer, charges of cartage, commission and handling expenses must be added according to conditions:

Fancy Wheat Hay	
(light 5-wire bales)	17.50@19.00
No. 1 Wheat or Wheat and Oat Hay	15.00@18.00
No. 2 Wheat or Wheat and Oat Hay	12.00@15.00
Choice Tame Oat Hay	15.00@18.00
Other Tame Oat Hay	12.00@15.00
Wild Oat Hay	10.00@14.00
Barley Hay	12.00@16.00
Alfalfa Hay	17.00@22.00
Stock Hay	8.00@12.00
No. 1 Barley Straw, bale	50@80

Citrus Markets

Los Angeles, September 24, 1919.
All citrus fruit is in good demand. Valencias are receiving a better demand, partly because of deciduous and small fruits grown near most Eastern markets are decreasing. Recent shipment has been prevented by shortage of cars. Many sales were made permitting close to $5.00 f. o. b. California price.
The market on California lemons is good, and every offering is quickly taken up though no buyer is anticipating future wants but buying only as needed. There are around 50,000 and 60,000 boxes of foreigns in sight.

Shipment

Shipments of citrus fruits to date since November 1, 1918; Southern California: Oranges, 32,241 cars, lemons 9085, total 41,326. To same date last season; oranges 13,708, lemons 5490, total 19,198. Central California this season: Oranges, 4427, lemons 354, total 4781. To same date last season; oranges, 2539, lemons 115, total 2654. Northern California; oranges, 244, lemons 2, total 246. Last year same date; oranges, 203.

ARCADIAN
Sulphate of Ammonia

In a great many cases an application of ARCADIAN Sulphate of Ammonia now will help size the coming citrus crop in addition to prompting bud growth for next season.

ARCADIAN Sulphate of Ammonia is for sale by: CALIFORNIA: San Francisco; Hawaiian Fertilizer Co., Pacific Bone Coal & Fertilizing Co., Pacific Guano & Fertilizer Co., Western Meat Co., California Fertilizer Works. Los Angeles; Pacific Guano & Fertilizer Co., Pacific Bone Coal & Fertilizing Co., Agricultural Chemical Works, Hauser Packing Co. OREGON: North Portland: Union Meat Co.
For information as to application, write
The Barrett Company
Agricultural Department
510 First National Bank Bldg.
BERKELEY, CALIF.

Economical Fertilization
The Beet Sugar Lime Fertilizer
costs $7.00 to $8.50 per 2,000 lbs. in bulk, f. o. b. cars points north of Rialto, south of Red Bluff. It is most readily available form of lime, being burnt, hydrated and composited in perfectly precipitated form, quick acting, immediately effective. Further, contains percentage of moist organic matter, analyzing a little nitrogen, potash, phosphoric acid, also trace of sulphur.
Stockyard Manure Mixture, $8
SHEEP MANURE, $11
largely from cottonseed, alfalfa meal and other rich feeding.
CHICKEN MANURE, $12-$13
largely from tankage, dried blood, fish and meat scrap feeding. The plant food values of manures depend upon the feed. At present cost of labor, teaming, trucking and freight, above highly concentrated manures from such rich feeding are most economical, unsurpassed plant food values. Latter prices are per 2,000 lbs. in bulk f. o. b. cars points south of Chico and north of Fresno.

Water!
All you want the year round wherever you want it—for house, barn, field, any place. Bore your own well, as thousands have done, with our time-tested
Standard Well-Boring Outfit
Easily operated by hand. Bores wells 8 to 16 in. dia., up to 100 ft. deep. One man bought outfit 8 years ago and has bored over 25,000 feet of wells.
BORES 100 FT. WELLS BY HAND
Make $20 to $30 per day boring wells for neighbors—easy to get 50 cts. to $2 per ft. E. C. Cole, Porter, Okla., writes:—Have just bored 41 foot well for neighbor in one day and made $41.00.
★ Thousands used during war by U. S. and English Governments. ★
Satisfied users in 46 states.
Every claim *guaranteed and proved*. Write TODAY for information and testimonials.

MALTHOID
and
RU-BER-OID
READY ROOFINGS

Here you see one of the shredding machines preparing rags for making into the tough, long-fibre felt which is the "base" or body of Malthoid and Ru-ber-oid Roofings.

Good ready roofing is simply a long layer of felt, saturated with a waterproof material and coated with a heavier weather-proof composition.

It can be seen then that the protection afforded by any roofing against sun and rain is in proportion to the quality of the materials that go into it. Thus the great importance of good, tough, long-fibre rag felt.

All the felt that goes into Malthoid and Ru-ber-oid Roofings is manufactured in our own mill. And because we are large consumers, we have the pick of the rag market. From this we carefully select the rags we need to make quality felt.

Malthoid and Ru-ber-oid are made to last. Starting with the felt, quality is built-in. Every step in the manufacture of Malthoid and Ru-ber-oid is carried on within our own mills and factories—under the care of experts—by means of the most modern machinery and facilities.

When you buy roofing *buy the best*—the safest protection you can get. It pays in fewer repairs and less cost per year of service. Malthoid and Ruberoid Roofings have been making good for years, under all sorts of extreme conditions. Malthoid and Ru-ber-oid are sun, rain and fire-resistant.

EACH THE STANDARD OF ITS KIND

The hens that pay are the hens that lay !

Just one way to tell the result-producers in your flock—the profit-payers. How? *By the amount of eggs they lay*. And egg-production is largely a matter of proper feeding—you know that! So it only simmers down to a question of "What shall I feed?"

Surelay is ready to solve this question for you—just as it has for thousands of other successful poultrymen. Then, why waste time and money and energy experimenting with hand-mixed feeds and mashes when Surelay puts the whole secret in the hollow of your hand?

Mixing feeds is our special business. We have the equipment. We have the facilities. *We know how!* We have studied it from a scientific and practical standpoint—have worked with Government and State Experimental Stations—and this, together with years of actual experience, enables us to produce a *uniform*, high-grade feed that will make your hens *pay* by making them *lay*.

And don't forget—Surelay keeps your flock in fine condition all the while. It's a perfect balanced ration—there's nothing in Surelay to "throw your hens off their feed." For Surelay is *always* uniform, *always* the same, *always* dependable! You will find a guaranteed analysis of Surelay printed on the back of every sack; and what's *on* the sack is *in* the sack—and that's what makes the eggs.

It has been proven time and again that cheap feeds lessen the profits of every hen in the flock. Thus, a uniform, high-grade feed like Surelay is *always economical*—and especially when prices reach the level they are today.

Our booklet, "Makes Hens Happy," takes up this feeding question in detail. It is full of practical information and money-saving suggestions. It has served as a guide-post to success for many a poultryman; perhaps it will be of help to you. This booklet is yours for the asking—simply fill in the coupon and mail *today!*

[Be sure to look in your Surelay sack for the Certificate that entitles you to our 1920 Surelay Egg Record and Calendar]

Peruvian Alfalfa, Wonder Plant of the Southwest

THE dairyman wants the greatest amount of feed from the least number of acres. California acres are too high in price to allow any to go idle or to produce other than the maximum. The best crop of its kind is therefore necessary. In hay production there is too long a record as wealth producer to give other than first place to alfalfa. There are many varieties which have been given a thorough test in California but as indicated by present day acreage the old original introduction from Chili still holds place of honor. Many new varieties have been tested out, perhaps more correctly, are being tested out, and the favorite of these new varieties being tested today is Hairy Peruvian. This has been given fuller test in Arizona than it has in California, and the Cultivator has asked its Arizona contributor, Mr. Bemis, to give his estimate of its worth. He writes:

It is true that the general appearance of the Hairy Peruvian alfalfa leads to the assumption that it is somewhat coarser than the common, but actual results in feeding do not seem to indicate that there is any more waste in feeding the Hairy Peruvian than the other.

The advantage of the Hairy Peruvian is that it yields from one to two tons to the acre more than the common. This heavier yield is not due altogether to the coarser, ranker growth, but is to a considerable extent due to the earlier growth in the spring and later growth in the fall.

Hairy Peruvian alfalfa has been grown in the Yuma Valley for a number of years and within the past two or three years has come into popularity in the Salt River Valley. Practically all new seeding in the Salt River Valley this past season was Hairy Peruvian. So far no seed is being grown to any extent in the Salt River Valley, but a considerable amount is raised in the Yuma Valley.

From Superintendent C. J. Woods of the Salt River Valley experiment station at Mesa I have the following records of yields from a sixteen acre field of Hairy Peruvian so far this season:

	Pounds
First cutting, April 16	51,845
Second cutting, May 15	50,500
Third cutting, June 25	44,000
Fourth cutting, July 26	42,137
	188,482

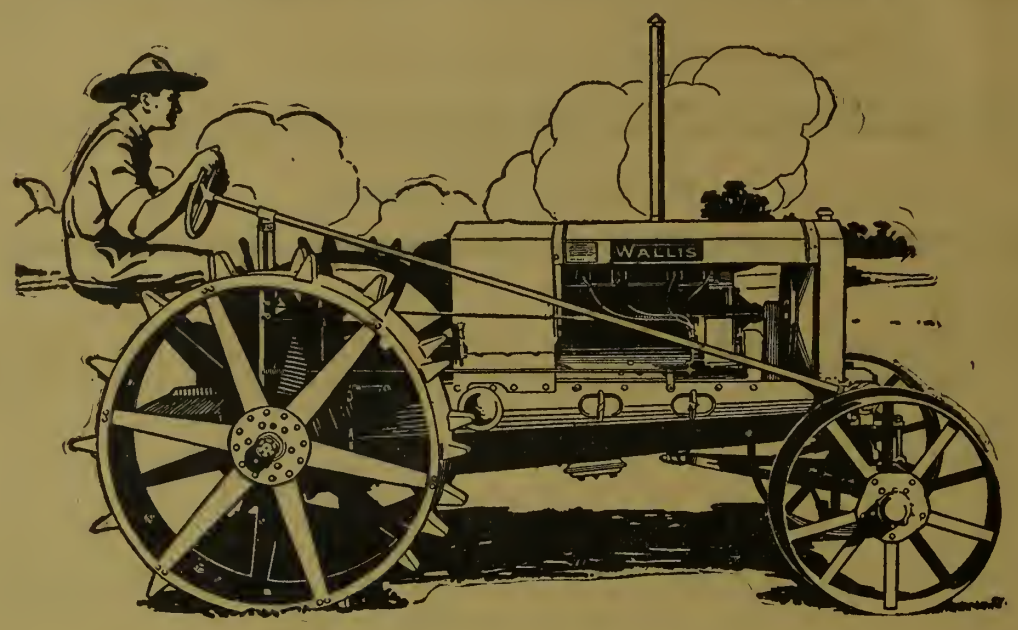
Making a total of 94¼ tons for the sixteen acres. This lacks 1¾ tons of being six tons per acre for the four cuttings. There will be a light cutting early in September and a heavy cutting in October with a fair cutting in November or some pasturage.

Certainly a wonder crop which makes for greater wealth of the great Southwest.

This field was seeded in November, 1917. Several varieties of alfalfa are being tried out in an experimental way on small plots. One variety which is known at the station as French alfalfa, in practically all tests has so far outyielded all others, including the Hairy Peruvian. No seed of this is yet available for distribution.

WALLIS

America's Foremost Tractor



Wallis Value Has Been Proved By Thousands of Experienced Farmers

THE Wallis Tractor was designed by Wallis engineers 12 years ago. From the date of its first introduction it enjoyed unequaled popularity. Its fame has spread rapidly until today it is known everywhere as "America's Foremost Tractor."

The man who buys a Wallis is assured of owning a tractor that has been tested and proved in actual farm service under every condition of soil and weather on thousands of farms in every section of the United States.

Mechanically Supreme

As an illustration, the Wallis frame is made of 3/16-inch, steel, boiler plate rolled into "U" shape. This is the lightest, yet strongest, construction in mechanics. This design does away with all beams, braces and counter-braces and therefore eliminates a lot of unnecessary dead weight.

Pound for pound, Wallis is the most economical and powerful of all tractors. The Wallis 4-cylinder, valve-in-head motor, Wallis unit power-plant, enclosed gears running in oil (first used by Wallis) and high-grade materials make possible the delivery of 74% of usable power at the drawbar. And that is the power you pay for.

Friction is reduced to an absolute minimum by the use of Hyatt and Timken bearings. Gears are of heat-treated, cut steel, avoiding costly repair bills.

Abundant Power

The Wallis has, therefore, a big reserve of power to meet difficult conditions and emergency jobs. Every farmer realizes the necessity and advantage of a tractor which can furnish plenty of power for all kinds of field and belt work.

In selecting a Wallis you are thus assured of more than ample power for plowing, discing, harrowing and reaping, and you also secure a complete farm-power-plant.

Bankers Favor Tractors

Your banker knows that power farming means bigger farm profits. He will favor the purchase of a good tractor. He knows that it is economy to buy the best.

The Wallis, America's Foremost Tractor—judged by durability, steady work and freedom from repair-cost—is the lowest-priced tractor on the market today.

Catalog Sent on Request

Write for Wallis catalog and name of nearest dealer. Prove for yourself that the Wallis, America's Foremost Tractor, is the most economical tractor you can buy, and the one that will surely solve your farm problems.

Big Demand for Wallis

If you would enjoy the profits of using a Wallis on your farm, you must act quickly. Therefore, do not delay writing us at once —or call on the nearest Wallis dealer.

Relation of Soil Moisture to Orchard Irrigation

Address Before State Fruit Growers' Convention, Riverside, by Samuel Fortier, Chief of Irrigation Division, U. S. Bureau of Roads

ORCHARD irrigation covers a broad scope. It may be said to begin with the precipitation which falls in the form of rain or snow and to end with the mature fruit on the tree. It embraces such main features as water supply, irrigation works, distributary systems, water delivery, application of water, water-holding capacity of soils, soil moisture and its distribution, besides a large number of closely related subjects.

Orchard irrigation is likewise the result of a combination of efforts on the part of men who differ widely in their training and experience as well as in their purposes and viewpoints. Many of the orchard districts of the far-West were started by promoters. Then followed financiers, managers, engineers, and real estate agents. By the time farmers started to plant trees, conditions as regards organization, management, water deliveries, and the quantity of water allowed per acre were more or less definitely fixed. It often happened, too, that the work of one set of men was not properly correlated to that of another set, so that misfits were the rule rather than the exception. While the real purpose of orchard irrigation is to grow better and larger yields of fruit, promoters and others frequently side-tracked the real purpose in order to attain some specific object which promised greater personal returns.

Adequate Water Supply

Before proceeding to a discussion of soil moisture, it might be well to refer briefly to the necessity of an adequate water supply in order to insure sufficient soil moisture not only to maintain orchard trees in a vigorous condition, but also to grow cover crops between the rows.

The history of the water supply for a typical orchard tract usually dates back to the time when a company, district, or other form of irrigation enterprise is formed to provide water for a certain acreage of barren or low producing land.

Amount per Acre

The average amount of water which can be used per acre as determined when the project is first organized and built is likely to continue for long periods of time. Thus, when the Gage canal, Riverside, was built in 1887, the duty of water was fixed at one miners inch for five acres, and for 31 years water deliveries have been based on this duty. At present the formation of a number of irrigation districts is under way in California, and in most of these, in determining the average amount of water which can be used on each acre of the newly organized enterprise, it is often necessary to curtail the use in order to make the undertaking appear to be feasible. This is especially true in localities where water is scarce and valuable. Assuming by way of an example that 30,000 acre feet of water is available for a proposed project and that this supply is apportioned on the basis of 2½ acre feet per acre per annum, it would only cover 12,000 acres and the construction cost might be prohibitive whereas if the basis of apportionment could be made 1¼ acre feet per acre, an area of 24,000 acres would be served with the same amount of water and the construction cost might thus be kept within economical limits.

Commission's Findings

The State Engineer, as you know, has to pass on this and other features of new irrigation districts, and as our bureau is cooperating with the office of the State Engineer, members of our force are frequently called upon to investigate and report on such matters. Mr. C. E. Tait, our resident representative in Southern California, has devoted considerable time during the past two years to proposed districts in Southern California. A commission of three, consisting of the State Engineer, J. A. Sourwine and C. E. Tait, has recently recommended in connection with the duty of water for Victor Valley on the Mojave River, that only those crops be grown on the greater part of the land which require a relatively small amount of water, in order that the water available may be made to serve the maximum area of land, and the acre cost of the works correspondingly reduced to the minimum in order to make the project financially feasible. In passing on this proposed district, the Commission found itself between the devil and the sea. If it recommended an adequate water supply for all crops adapted to that locality, including alfalfa, the cost would be prohibitive and no districts could be formed. If it reduced the estimated seasonal amount of water which could be used, below a certain quantity, the crops were liable to suffer, and so it adopted the only middle course possible by recommending the planting of such crops as apples and pears, which require a small amount of water.

Water is Life

In attempting to fix the duty of water for proposed irrigation districts in San Diego County, similar difficulties have arisen. Some of the promoters of these districts seem to think 8/10 of an acre foot per acre, or what would be equivalent to one miners inch flowing throughout the year for 14½ acres would be sufficient. Their hydraulic engineer cites cases where one miners inch served 24 acres of orchard. In arriving at a decision where differences of opinion exist, it is necessary to consider the welfare of the grower of fruit as well as the vendor of land and water.

Water is to the orchard what blood is to the human body. Both are conveyors of food. So essential is water to the life and vigor of the fruit tree that an adequate supply should be guaranteed or procurable before a tree is planted. It is said that half a loaf is better than no bread, but this adage does not apply to a water supply for fruit trees. There is nothing gained in merely keeping trees alive. In order to be profitable, trees must have sufficient water and food, coupled with other favorable conditions, to resist disease and to produce a fair crop of marketable fruit.

Cover Crops

This brings up the question of cover crops. If cover crops are necessary, all new enterprises should be provided with water not only for the growth of the trees but also with some surplus to be used in growing leguminous crops for plant food.

It requires from 750 to 1200 pounds of water to produce one pound of air-dried alfalfa, and other leguminous crops will require nearly as much. Accordingly, in localities where the annual rainfall is low, sole dependence cannot be placed on the winter rains to furnish moisture for cover crops. Part of the soil moisture must come from the irrigation supply, but as I have intimated, horticulturists, irrigation engineers and others are not in agreement as to the proper duty of water for orchards, largely because of the amount, if any, that should be allowed for crops grown between tree rows.

Practical Observations

In the eighties, when I was assistant engineer of the Denver Water Company, I had occasion to do some work at Greeley, Colorado. For 12 or more years prior to that time the farmers of the old Greeley Colony had been growing grain under irrigation, year after year. In time this crop became unprofitable, due to small yields. Alfalfa was then introduced and at a later period sugar beets. As a result of rotation with alfalfa as a base, a wonderful change has been brought about, not only in the quality and quantities of the crops grown but also in the condition of the soil and the manner in which water can be distributed through it.

In the early nineties, when I was director of the Montana experiment station, our practice was to sow red clover seed with the grain and to cut the clover the following season for hay. By this simple two year rotation of grain one year and clover the next, we produced very heavy yields. In one year wheat yielded as high as 78 bushels per acre and oats 120 bushels. These high yields would not have been possible without a large percentage of organic matter and an adequate and well maintained moisture content in the soil.

In establishing a sub-experiment station at Gooding, Idaho, we first grubbed out the sage brush. It is well known that arid soils are as a rule lacking in vegetable matter and to supply this deficiency we applied manure. The effect of this manure coupled with rotation, enabled us to produce over nine tons of cured hay per acre of both red clover and alfalfa in three cuttings.

In 1906 when I was preparing a report for the Government on irrigation in the Sacramento Valley, I had occasion to look into the effect of long-continued cropping to wheat in this valley. The evidence that I collected at that time showed that the physical condition of the soil had undergone a change for the worse. It had become more inert and sticky and required more mules to run a gang plow. At that time, too, wheat raising in the Sacramento Valley was not a profitable industry on account of the low yields. That was some 12 years ago and since then there has been an enormous development along the lines of irrigated agriculture. Many of these old wheat fields, which produced 10 to 12 bushels per acre have been in alfalfa for years and when the alfalfa stubble is plowed under, the soil is found in excellent condition for subsequent crops.

Grow Cover Crops

I sometimes think it unfortunate that we can not pull up the citrus trees of California as one would fence posts, grow alfalfa on the tracts for three years, then turn under the alfalfa stubble and return the trees to their original places. If this were possible, you would find, I believe, that any common method of irrigation would suffice to produce excellent yields of fruit. The nearest approach to the application of this remedy is to grow leguminous crops between the rows or use manure. The time is approaching when manure in sufficient quantities will not be available and recourse must be had to cover crops. In such cases it is imperative that sufficient water be furnished either from the clouds or the irrigation canal, not only for the requirements of the trees but also to grow the legumes necessary to maintain the fertility as well as the proper physical condition of the soil.

Water-Holding Capacities of Soils

If a 40 gallon barrel is filled with soil approaching the condition in which it exists in an orchard, it is possible to add from 7 to 15 gallons of water, depending on the character and texture of the soil, before any runs over. This, however, is not the way soils are irrigated. To approach conditions as they are found on an irrigated tract, it is necessary to punch holes through the bottom of the barrel and allow the water to drain out. The water which drains out is called free water and what remains, capillary water. This is the reason I have called this topic the effective water-holding capacity of soils, since in all ordinary cases the free water either drains off or becomes capillary water. In filling reservoirs, tanks and other vessels with water, the capacity of each is known and there is no occasion to waste water in overflows. It is different in the case of soils for the reason that it is not generally known how much water soils will hold against gravity within the root zone of plants. This knowledge would be easily gained if all soils and subsoils were alike in character and if the roots of fruit trees and other plants were always found at the same depth below the surface. Soils and subsoils differ very widely in texture and character. While sand, silt and clay are the chief ingredients in all soils, the relative proportions in which these occur may be said to be infinite. It is, however, possible to group these into a small number of divisions. For the purpose of this paper, we may call these sand, sandy loam, fine sandy loam, gravelly loam, silt loam, loam, clay loam, and clay. In addition to the mineral matter, there is in soils a small amount of decomposed vegetable matter called humus which averages less than one per cent in arid soils besides great varieties and infinite numbers of micro-organisms chiefly bacteria. In certain localities, the surface soil is underlaid at varying depths by a more or less impervious sub-stratum called hard pan. Hilgard's definition of this is a dense and more or less hardened layer in the subsoil which obstructs the penetration of both roots and water. This, in brief, is the situation which confronts the irrigator in regard to soils. Some are so porous that when water is applied to the surface it soon percolates far beyond the deepest roots and leaves little in the upper six feet of soil. Other soils are so dense that little, if any, water will pass through them and the moisture held in the top layer is soon evaporated. As regards the more porous types of soils, it would seem important to determine how much water can be stored in the upper four to six feet in order to prevent undue waste of water by deep percolation.

In the Sacramento Valley the average quantities of water retained per acre-foot of soil at each irrigation were 0.82 acre-inch for the silt loams, 0.58 acre-inch for the clay loams, and 0.37 acre-inch for the clays.

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

"Its long, branching roots penetrate far down, push and crowd the earth this way and that, and thus constitute a gigantic subsoiler. These become an immense magazine of fertility. As soon as cut, they begin to decay and liberate the vast reservoir of fertilizing matter below the plow, to be drawn upon by other crops for years to come." That is alfalfa, which means so much to California's advancement. Alfalfa as a part of the ration of hogs means more economical fattening; fully ripened alfalfa hay means strength and better condition of the horse; alfalfa with silage means greatest of butter production. Alfalfa takes to California and the Southwest as do few other crops. It means more to the Pacific Coast than all its gold mines.

WEALTH IN GRAPES

And now the estimate is out that Northern California's grape output will total in value $75,000,000 this season. This is its record crop and its record price. In fact, one estimate has it there will be three times as many table grapes shipped out of the state this season as in any former year. It is even expected that of wine grapes alone there will be shipped 15,000 carloads. California is the greatest grape growing section of the world.

CUT OUT THE APPENDIX

President Wilson says: "Politically, socially, economically the world is on the operating table." There has already been a fearful loss of blood, but the only salvation for the patient is to continue the operation and put an end to the disease of Bolshevism.

But Bolshevism isn't entirely confined to the Russian peasantry or even to American malcontents; there is, for instance, the profiteer.

FALL CONFERENCE

The regular fall conference of farm advisers of California will be held at Berkeley, October 22. It is expected that representatives from nearly every farm bureau county of the state will be present and it is hoped at this time to perfect the organization of the State Farm Bureau Federation. Sixteen counties of the state have ratified the constitution of the organization.

PROTECT THE BEANS

There are two sides to the tariff question; at least there is a political side and there is an economic side. We have neither the time nor the ability to discuss the question from either of these sides, but we know there are American homes which have been affected and suffering has been caused by last season's importation of Asiatic grown beans. The same Asiatic ports that had the beans for American trade a year ago are still able to send to this country thousands of tons, and apparently this country is prepared to admit these beans regardless of the effect on American homes. Now whether we are believers in protecting American beans or American bacon, let us at least insist that American homes be protected.

THE FIRST RAIN

The first rain of the season has come. In Southern California it was devoutly desired for the fire fiend was sweeping along miles of mountain ranges. And this seemed to be a Southern California storm, for from one to two inches, and even more in some mountain sections, was precipitated. North of Tehachapi the rainfall was very light, at Fresno .23, San Francisco .28, Tulare .53, Sacramento .10, Red Bluff .03. The saving of the mountain watersheds gave a value beyond computation; at the same time there was much damage to beans, beets, drying fruit and to a small quantity of hay. The sun is clearing, and it is now hoped the beans will dry off and still be threshed. The state is dry and we need abundant rainfall, and here's hoping, regardless of all theories about a dry season, that the early rain means long continued ones.

GASSING THE BUGS

In the article regarding the state department of agriculture on the fifth page of this issue we refer to Mr. Mackie's work in vacuum fumigation of moth infested potatoes. The tuber moth has been a most perplexing pest for the California potato grower. It has not only proved a great injury to the growing crops, but fear of it has affected prices and prevented export. Once imbedded in the flesh of the potato it seemed there was no possible remedy. Now the air is pumped out of its deepest burrows and the deadly gas is pumped in. The result is sure death and assurance to the trade and to quarantine officials that there is no possible danger from such a shipment. Full cars of cotton have been run into great tubes, the air exhausted, the gas admitted in a way similar to that above described, and the cotton has been absolutely freed of the deadly bollworm or other pests.

Strength to the arm of Mr. Mackie; likewise of the entire force of the department in perfecting and operating this plan of insect control.

MILK SURVEY

The California State Dairy Council is making a survey of the pupils in the public schools in California and securing information as to the use of milk and dairy products in the homes of the school patrons. A series of circulars has been issued, the first one having in large type; "Mothers, please fill out." With this circular goes a card with request for name, grade, height, weight, and for information as to whether the child receives one glass, one pint or more milk daily, or whether it receives no milk. The Dairy Council is securing information as to the claim that has been made that California babies are larger and healthier than babies in other sections of the country, and also desires to learn as to what effect California's milk supply has in securing better health and greater stature. Other states have held these surveys and have developed thousands of cases, pitiful as to particulars, in that many of America's school children are suffering from malnutrition. This is an educational campaign and we trust will develop information as to California's ability to fully nourish the little ones.

CONTRACT UPHELD

Practically all of the members of the Prune and Apricot Growers' Association are standing true and marketing their product at a vastly higher price than they would if the organization did not exist. They are being embarrassed, however, by disloyal members who in the hope of apparent slight advantage attempt to violate their contracts. The association, however, proposes that where it has placed orders for boxes and supplies; where it has sold to jobber or wholesaler it must have the goods which it has sold and which were contracted to be placed in its hands for disposal; hence it has gone to the courts to compel delivery of the goods.

In one case in Napa County the association sued to prevent delivery of the goods to an outside purchaser. Judge Sewell rendered his decision in favor of the plaintiff association and ordered the issuance of the restraining order asked for in the complainant's petition. This decision upholds absolutely the legal status of the California Prune and Apricot Growers' contracts with grower members.

Here's hoping we may have more just judges.

The California Prune and Apricot Growers, Inc., writes:

"Although the members of the California Prune and Apricot Growers' Association are obtaining the maximum price for their dried prunes by reason of their membership in the organization, there is occasionally a member who, for some trivial reason or hoping to benefit himself by a fractional part of a cent per pound, due to some transient local trade condition, attempts to evade the terms of his contract with his fellow growers and the association.

"Instances of this kind are rare, but a typical case has just been judicially passed upon in Napa County. The case is California Prune and Apricot Growers, Inc., vs. Guy W. Young. The proceeding was before the superior court of Napa County, Judge Sewell of San Francisco temporarily sitting in place of Judge Gesford, on the petition of the Prune and Apricot Growers' Association for an injunction to restrain the defendant Young from selling or disposing of his fruit to any person or in any other manner than to the petitioner under the terms of his contract.

"Judge Sewell rendered his decision in favor of the plaintiff association and ordered the issuance of the restraining order asked for in the complainant's petition. This decision upholds absolutely the legal status of the California Prune and Apricot Growers' contracts with grower members."

AGRICULTURAL CLUBS

The Fifth Annual Agricultural Convention will be held at University Farm, Davis, October 16-18. This will call to Davis a large number of the brightest high school boys of the state. This agricultural club movement has resulted in friendly rivalry inspiring a most effective agricultural education.

FINE 'EM "GOOD"

Live stock people of the Sacramento Valley are having an experience with anthrax, an experience which is far from gratifying. They propose this experience shall be ended as soon as may be, and to that end are appealing to the state department of agriculture, live stock division, for strict enforcement of regulations and laws. The department is responding right heartily, and we notice that a meat peddler in Butte County was arrested for selling the hide of a cow which died of anthrax. Mr. Hideseller pleaded guilty rather than stand trial and was let off with a fine of $100 and in addition the condemnation of the people of the community. They propose that such practices shall stop and the live stock industry shall be saved.

PREPARE FOR RAIN

California's raisin, prune and other dried fruit industries suffered the loss of millions last year because of the September storms. It was a lesson which caused great preparation for a similar event this year. While this similar event this year was unexpected, it did come, though it was not so serious as last year. The damage has been comparativel slight, though it is too early to estimate it fully. It will be sufficient to speed the day when we may be better prepared with sheds, dry houses and other equipment. Touching on this, the Tulare Register says:

"How great the damage resulting from the rain is a matter upon which we have at this writing little direct information, but whether there was much or little, the showers again emphasize the risk that raisin and prune growers must run every year. For the past three weeks every fruit grower who has had fruit on the trays has been on the anxious seat, fearing the visitation at any time of a rain of sufficient volume and duration to ruin the product. The more we consider the situation the more we are inclined to believe that the present precarious system of curing fruit must give way to, or at least be supplemented by, drying sheds. The initial cost of the right kind of drying plants is no trifle, but the cost of 'running' them is not great, and as an insurance against loss they will be worth all they cost. It might not pay owners of small vineyards, but in many instances arrangements might be made for a cooperatively owned plant or for using one owned on a near-by vineyard."

California Department of Agriculture

THE people of the state of California do enact as follows: Section 1. A department of the government of the state of California to be known as the department of agriculture is hereby created. The department shall be conducted under the control of an executive officer to be known as director of agriculture, which office is hereby created. The director shall be appointed by and hold office at the pleasure of the governor, and shall receive a salary of $5000 per annum. Before entering upon the duties of his office the director shall execute an official bond to the state of California in the penal sum of $25,000, conditioned upon the faithful performance of his duties. He shall maintain his office at Sacramento and shall adopt and keep an official seal. He shall act as chief of one of the divisions herein created, etc., and the governor appointed as such director Geo. H. Hecke, the last of the horticultural commissioners of this state. Mr. Hecke's great desire is to make of this department such a success that it will place California agriculture on a plane far higher than it has ever held in the past. And this is some task, for California has a reputation reaching to the Antipodes as a section most advanced agriculturally.

At the recent State Fruit Growers' Convention there were representatives from New Zealand and Canada and Mexico, from Argentina, from India. These men had been drawn to this state to study California methods of handling her horticultural problems. And this was not exceptional, for there is no time but some investigator is asking Californians, "How do you do it?" and especially is this the case regarding its legislation, and the enactment, a paragraph of which is given above, is a matter of material interest to other countries and other states. Our new department follows very largely the methods and general plan of organization which have been found best for the United States department of agriculture.

The executive and general offices will be in the city of Sacramento. The various commissions, the state veterinarian and other officials, which have heretofore been in the Forum Building, will ultimately have their offices brought together in a buliding to be constructed by the state near the present state capitol. But as this building will be some time in construction, there is a necessity for gathering for greater efficiency at once, and a new building with well lighted large rooms has been secured at the corner of Eleventh and K Streets. The state insectary and its offices will still be maintained in the small structure in the center of Capitol Park, Harry S. Smith in charge. A branch of the state insectary has been located for some years at Alhambra. Its greatest work during the past two years has been in making investigations as to parasites and predacious insects which attack and help control the citrus mealybug. This work has been in charge of H. M. Armitage. The capacity of this station has been doubled by locating near it another branch insectary. Still another station has been established in conjunction with the Limoneira Ranch at Santa Paula.

Headquarters for the office of plant quarantine will be continued in San Francisco with Frederick Maskew in charge. The work of Mr. Maskew has made California quarantine efficiency known the world around.

The quarantine work for the southern end of the state, including Los Angeles and San Diego harbors, has been under direction of C. H. Vary. Many an insect or fungous trouble, which would have meant loss of millions to the state, has been stopped and destroyed at California's ports. The Southern California branch of the department has headquarters in the Union League Building, Second and Hill Streets, Los Angeles. The office is in charge of D. B. Mackie who has been instrumental in devising means of walnut codling moth control, or rather in preventing its spread. Mr. Mackie has recommended the use of the common laundry mangle or heated rollers through which the sacks, often infested with larvae of the moth, are run, and this treatment most effectively destroyed the pest. Mr. Mackie's deputies are busy at this period of the year making malnut packing house inspection and preventing distribution of boxes, sacks or other carriers of the pest.

The latest of his work has been tuber moth investigations. This pest once imbedded in the flesh of the potato has been supposed immune to any attack. Mr. Mackie is now giving it the vacuum treatment so effectively that the moth comes out so perfectly dead that he is a very good moth. The treatment consists in running the truck, or even the car if necessary, into a steel chamber which is sealed and the air exhausted. A "26 inch vacuum" is created. This removes practically all the air from the deepest burrows in the potato, and Mr. Worm within has his body so distended by the partial vacuum that he is ready for the next dose which consists in filling the tank or container with the gas of hydrocyanic acid. The Cultivator representative was shown specimens of these worms just removed from the flesh of potatoes, and every one of them, found in these potatoes given a 30 minute dosage, was dead. This same method has been used to sterilize and to destroy the pests in dates. In the Coachella Valley Submarine we note that:

"A most interesting and successful test was made on Tuesday of the new machine for fumigating dates which has just been installed at the new factory of the California Date Association. The system is what is known as the vacuum system of fumigation which was worked out and invented by Prof. D. B. Mackie, who as field entomologist of the state department of agriculture, assisted by Harry Steiner, installed and tested out the machine."

The office of viticulture brings to the state work a new man, R. L. Nougaret, formerly with the department of agriculture and a lifelong investigator of viticultural questions.

His last work before taking up state duties on September 1, was with the federal government of agriculture, working in the Fresno district on grape mealybug. This is a most serious pest and California vineyardists are questioning as to the future of the industry unless some method of control is devised. Mr. Nougaret's work at the present moment has to do more largely with preventing the spread of the pest, and methods of control will be taken up later. Winter spraying has but little effect because of the scaly nature of the bark of the vine. Fumigation has, however, proven very effective and can be conducted very economically.

The office of standardization is one comparatively new to California. This office was made necessary by enactments of the 1917 and 1919 state legislatures, the intent of which is to prevent shipment of fruit which will injure California's reputation and destroy her markets. This office is under the direction of Avery S. Hoyt. The entire division, that is, covering the offices of quarantine, viticulture, pest control and standardization, has for its chief the director, George H. Hecke.

The chief of the division of animal husbandry is J. P. Iverson. In this division there is the office of dairies and live stock, the office of cattle protection, and another having to do with statistical records.

Commissions, bureaus and boards having to do with agriculture, which have been brought under the jurisdiction of Director Hecke, are:

State commissioner of horticulture, state board of horticultural examiners, state dairy bureau, state veterinarian, stallion registration board, state board of viticultural commissioners, board of citrus fruit shipments, cattle protection board; and whenever by the provisions of any statute or law now in force or that may hereafter be enacted as a duty or jurisdiction is imposed or authority conferred upon any of said bodies, offices or officers, such duty, jurisdiction and authority are hereby imposed upon and transferred to the director of the department of agriculture the same as though the title of the director of the department of agriculture had been specifically set forth and named therein.

The personnel of the entire department is:

Executive Office

Geo. H. Hecke, director.

B. A. Reynolds, editor; O. W. Newman, technical assistant; Mrs. Kathleen W. Brown, chief clerk; H. W. Levers, chief accountant.

Division of Plant Industry

G. H. Hecke, chief; R. H. Taylor, assistant to the chief.

Office of Pest Control

Harry S. Smith, entomologist in charge; W. C. Jacobsen, superintendent rodent control; D. B. Mackie, field entomologist; H. M. Armitage and C. P. Claussen, assistant entomologists; E. W. Rust, parasite collector; E. J. Branigan and A. E. Gray, field assistants; Harold Compere, Paul Howard and Marshall Monroe, laboratory assistants; W. M. Phillipson and Harry Steiner, codling moth inspectors (walnut).

Office of Standardization

A. S. Hoyt, superintendent; W. I. Newcomb, A. W. Tate, Jr., district apple inspectors; S. V. Christierson, standardization inspector; W. V. Shear, potato seed inspector.

Office of Plant Quarantine

Frederick Maskew, quarantine officer in charge; C. H. Vary, George Compere and L. A. Strong, deputy quarantine officers; L. A. Whitney, technical assistant; A. C. Chatterley, Stewart Chatterley, A. C. Fleury, L. E. French, J. W. Mashmeyer, V. G. Stevens and G. R. Wilson, quarantine inspectors.

Office of Viticulture

R. L. Nougaret, viticulturist in charge.

Division of Animal Industry

J. P. Iverson, chief; J. G. Jackley, assistant chief and bacteriologist (in charge of dairy inspection); A. L. O'Banion, deputy veterinarian and chief inspector; Miss W. Kady, principal clerk.

Office of Dairies and Live Stock

J. J. Frey, pathologist; H. P. Bonnison, chemist; E. M. Keefe, district veterinarian and dairy inspector; A. C. Rosenberger, district veterinarian and dairy inspector; D. F. Coyner, R. E. Duckworth, George Gordon, A. F. Hanna, John S. Hay, F. A. Pfaffman, F. G. Whitehead, F. P. Wilcox and O. W. Kerr, veterinarians and dairy inspectors; H. G. Asselstine, E. H. Biles, Clifford Bresee, M. E. Coulter, W. F. Elder, A. L. Ford, Ray Hasson, D. W. MacNair, B. D. Mason, W. M. Russell, A. W. Sloan, S. E. Watson and I. D. Whitaker, dairy inspectors.

Office of Cattle Protection

W. O. Bottorff, special inspector; J. B. Newsom, superintendent and secretary; Charles Keane, Edward Reddy and Louis Williams, inspectors.

Special Dairyman's Day

For several months plans have been under way for a special meeting of Southern California dairymen during the fall months under the auspices of the Los Angeles County farm bureau. Plans have been definitely matured, and Thursday, October 23, has been assigned by the Livestock Show management as dairyman's day.

The afternoon of the first day there will be a dairy cow judging demonstration conducted by F. H. Scribner, noted dairy cow judge, and now assistant farm adviser of Los Angeles County. In the evening at an uptown auditorium, to be announced later but probably Symphony hall, all Southern California dairymen are invited to meet as guests of the California Dairy Council. A good program of pictures and music and short speeches will be provided. The cow testing department of the Los Angeles County farm bureau will stage a cow testing exhibit in connection with the Livestock Show, showing individuals of excellent conformation but not paying costs, individuals of excellent conformation and high producers, individuals of comparatively poor breed but good productivity, etc., the point being to emphasize the necessity of testing in order to pick out the animals that are really paying.

Program

9:30 a. m. — Auditorium State Exposition Building, Vice President J. B. Vaile, San Dimas, presiding. The Los Angeles County Farm Bureau, Secretary W. S. Rosecrans, Gardena; The State Dairy Council Idea, S. H. Greene, secretary-manager California Dairy Council, San Francisco; The Place of Cow Testing in the Dairy Business, N. A. Negley, dairy division, U. S. department of agriculture, Salt Lake City; Ten Years of Testing and Feeding in Humboldt County, The Hon. F. J. Cummings; What Cow Testing Has Done for Our Herd, William R. Harriman, superintendent Los Angeles county farm; Feeds and Feeding Rations for Dairy Cows, Assistant Farm Adviser G. E. Gordon.

2:00 p. m., In the fair grounds, Assistant Farm Adviser F. H. Scribner will conduct a judging demonstration.

8:00 p. m. at an uptown auditorium (probably Symphony hall) all dairymen are invited as guests of the California Dairy Council to a get-together meeting. Interesting program of music and pictures.

Agricultural News Notes of the Pacific Coast

Northern California

Colusa is to have a broom factory.

It is predicted hops will go to $1 a pound.

The Placerville fair dates are October 23-25.

Butte County's hop crop is estimated at $750,000.

The Butte County almond crop is 60 per cent of normal.

Wild deer along the upper Sacramento river are dying of anthrax.

The Chico cannery put up 20,000 quarts of peaches and other fruits.

The Oroville district reports a bumper fig crop, selling at 15 cents.

Nord, a town eight miles from Chico, was destroyed by fire September 19.

A thousand tons of ice per day is used at Roseville for refrigerator cars.

A ten-acre tobacco crop near Sacramento sold for nearly a dollar a pound.

Rice growers in Colusa County will receive about $8,000,000 for their crop.

Hop land has been selling in the Santa Rosa district for $1000 an acre.

Guinda, Yolo County, shipped a car of 641 sacks of almonds, weighing 26 tons.

A ton of huckleberries each day is shipped from Fort Bragg, Mendocino County.

California's first 1918 rice shipment from field to mill was at Willows September 20.

Sutter County cattle are menaced by several epidemics of anthrax and vaccination is becoming popular.

The state engineer advises the formation of a Honcut-Yuba irrigation district in Butte County.

The California Association of Nurserymen have been invited to hold their 1919 convention at Chico.

On September 24 at Santa Rosa 250 grape growers met and decided to make wine and hold it until it can be sold legally.

The Comptonville, Yuba County, district is unusually active by reason of the good roads system recently built in that section.

A Yuba County grower has for several years marketed crops of Grindelia robusta, a native weed used in asthma and throat troubles.

Tehama County exhibited and explained to visitors at the State Fair an immense colored relief map which proved very attractive.

The Gravenstein apple crop in the Sebastopol district shows an increase of 50 per cent over that of last year. Total output 500 cars.

Word from Sacramento states that the standardization law is meeting with the approval of the majority of fruit growers in every district.

The California Almond Growers' Association has made prices as follows: Nonpareil, 30c, I. X. L., 28c; Ne Plus Ultra, 26c; Drakes, 21c.

The Northern California Coney Club had a fine exhibit of rabbit furs at the State Fair in addition to the immense display of live animals.

At the San Francisco Civic Auditorium, October 4 to 9, the post office department will demonstrate how to pack fresh farm products for mailing.

H. Clay Miller, formerly of the food administration department, states California farmers have 150,000,000 pounds of beans for sale at cost of production.

Central California

Salinas is to build a $10,000 cannery.

California's almond crop is valued at $3,000,000.

The shortage of grape cars at Lodi grows worse.

A large acreage of Kadota figs is being planted about Oakdale.

Turlock held its first and very satisfactory hog sale September 26.

Monterey County's fair October 10-11 will be opened with a barbecue.

Lodi growers are testing ventilated box cars in shipping grapes east.

Prices of hogs sold at Tulare last week ranged from $13.25 to $15.25.

Turlock has a new sweet potato curing plant that employs 100 persons.

Over 5000 people visited the two-day fair at Poplar, Tulare County.

The Derlow family of eight made $728 first month of picking fruit near San Jose.

Tulare will vote October 27 on a bond issue of $90,000 for building an auditorium.

The crop of the Thomason olive orchard near Lindsay sold last week for $190 a ton.

No figs may legally be packed that are mouldy or sour or wormy. Uncle Sam has said so.

Some apple growing sections of Central California reported a lack of boxes this season.

Parkerfield, Monterey County, reports the extermination of ground squirrels in that district.

At a sale of grade dairy cows at Turlock September 17 an average of more than $90 each was had.

A milk bar for dispensing milk by the glass will be a feature of the Tulare County fair, October 8-11.

A three year old Thompson Seedless vineyard at Terra Bella, Tulare County, returned $480 an acre.

The Suddarth family of five made $709 the first month of prune picking on the Rawlings ranch, San Jose.

The largest Duroc-Jersey sale of the state took place in Tulare County; consideration $15,000, for 238 hogs.

The Byron-Jackson Iron Works of San Francisco is constructing a branch foundry and machine shop at Visalia.

The three Tulare creameries paid $3000 in wages more during the last month than the corresponding month in 1918.

G. W. Osterhout has bought 480 acres in the Poplar district, Tulare County, and will plant it to Thompson Seedless.

The women's department of the Tulare fair, October 13-19, will have a large exhibit of needlework, flowers and babies.

Tulare County citrus growers will conduct a five years' series of soil experiments under direction of the Riverside station.

A man representing Japanese offered $20.000 for a piece of real estate of Porterville but was refused. No Japs for that city!

The first annual meeting of the San Joaquin Water Conservation and Development Association will be held at Tulare October 24.

Col. R. B. Marshall, for eleven years chief geoprapher of the United States geological survey, has presented a plan for irrigation of all the Sacramento and San Joaquin Valleys.

Southern California

Ventura buyers offer 12 cents for beans.

Ten thousand acres south of Chino are untilled.

Don't forget the fair at Riverside October 7-11.

A Los Angeles firm is making binder twine from yucca leaves.

The "All-Highlands Lemon Association" is being organized.

One Orange County walnut grower sold his crop for 29 cents a pound.

More than 1000 bales of 1919 cotton have been sold at Blythe for $33.50.

Santa Barbara reports local bean fields yield but one-fifth that of 1918.

There were five sales of citrus groves at Covina last week, two to newcomers.

Chino ranchers are specializing on red kidney beans, a great success in that district.

The honey crop in Southern California is light, owing to light rainfall of last winter.

A. S. Wysong of Los Angeles won the $10,000 prize for the best walnut stamping machine.

Cotton producers in ten Southern states have combined. Southern California growers may have to do likewise.

Citrus growers of California received $75,600,000 for 45,692 carloads of oranges in the year ending September 1.

Camarillo will build a cold storage plant at the cannery because of fruit rotting during the recent railroad strike.

The new packing house of the Yucaipa Apple Growers' Association is now in operation, with a crew of 50 packers.

F. W. Mathiessen has purchased 47,000 acres in Santa Barbara and Ventura Counties from H. and W. Pierce of San Francisco.

A crop appraiser states Palo Verde Valley farmers borrowed in 1919 less than one-half the sum obtained in 1918. Prosperity!

Sudan grass has been barred from the Imperial Valley as the farmers are afraid of it, being too closely a relative of Johnson grass.

Ganesha Park, Pomona, is so popular as a picnic ground for the whole countryside that its resources are becoming heavily taxed.

Santa Barbara walnut growers blame a spray used by them for a free dropping of leaves which makes nut gathering difficult.

Lankershim fruit growers have found more water increases the crops and many orchards are being piped for summer irrigation.

A baby sleeping close to a window next to an orange grove was nearly suffocated at Covina last week by gas from orchard fumigation.

A fumigator at Covina came near dying from a small amount of hydrocyanic acid that had been sprayed on his lunch unknown to him.

The irrigation rush is over in the Palo Verde Valley and last week's water supply was cut more than one-fourth over previous week.

Brawley shipped in one day last week one car of cotton seed, two cars of milo maize, one car of bones (?), one car of bottles (empty), and five cars of ice.

The Coast and General

Yuma Valley reports a serious shortage of cotton pickers.

The crop of sweet potatoes in Texas is much larger than in 1918.

Fall and winter grains are being sown in Utah and Washington.

Hood River, Oregon, reports a decided shortage of nursery trees.

The fifth cutting of alfalfa has been finished in Arizona and California.

Experts estimate the California-Arizona cotton crop is worth $43,360,000.

California has won second place from Texas as a rice producing state.

Indian corn in Washington was much improved by the September rains.

Light showers fell last week over all sections of Arizona and New Mexico.

A Cashmere, Washington, orchardist sold his apple crop from eight acres for $24,000.

Joe Brown of Sumas, Washington, made a profit from nine acres of berries of $333 an acre.

Railroad yards throughout Arizona are choked with loaded cars and empty cars are very scarce.

James H. Wells, Baldwin, Florida, marketed his fig crop for 20-25 cents per quart by the crate.

Italy needs American live stock, meat and dairy products but has enough poultry and eggs.

Of the 30,000,000 bushels of peaches in the 1919 crop in the United States, California produced 16,000,000.

A tornado damaged fruit and vegetables in Dade County, Florida, recently to the extent of a million dollars.

The highest week's shipments of cantaloupes from the Rocky Ford, Colorado, section this year was 1500 cars.

The grapefruit or pomelo crop on the Isle of Pines, Cuba, is a large and fine one and two weeks earlier than usual.

In Millard County, Utah, 54 farmers pooled their wool clip and got 50 cents a pound, seven cents higher than ever before.

The Southwest Cotton Company of Goodyear, Arizona, sold 24 Duroc-Jerseys ten months old for $1305, about $54 each.

Japanese potato growers at Yakima, Washington, who have half the potato acreage, are holding for a minimum of $35 a ton.

A colony of Hindus southeast of Chandler, Arizona, have 200 acres of cotton and 200 acres of maize, all high class.

A tunnel 14 miles long through solid granite is part of the new irrigation system near Seattle, Washington, a four-year job.

The Cactus Food Products Company of California has secured government permission to harvest the cactus crop on 15,000 acres of wild lands.

A delegation of cotton growers of the Salt River Valley, Arizona, under the direction of County Agent H. C. Heard, visited the Sacaton experiment farm, about 40 miles south of Phoenix. This farm is on the Pima Indian reservation and is where the Pima cotton was developed. Experimental work with cotton is still going on at this station and the cotton growers felt well repaid for the trip.

STORY OF THE LEMON

By H. B. Cady

LEMONS are picked with more care, cured longer and handled oftener before reaching market than any other citrus fruit. It has been stated that a lemon, as the housewife knows it, is only half made when it leaves the tree.

As the best quality of lemon is one which has been picked green and properly cured, the picking is based on size more than maturity. The mature yellow fruit, or tree ripe fruit as it is commercially known, is somewhat inferior to the cured fruit in flavor, acidity and keeping qualities. Each lemon is sized before being picked This is done with a metal ring to which is fastened a smaller ring which fits over the second finger of the picker's left hand, enabling him to size each fruit as he takes hold of it. If it passes through the ring it is left until the next picking, which is usually about 30 days later. Different packing houses use different sized rings and some change the size at different times of the year. The most commonly used ones are: Number eight, which is two and one-fourth inches in diameter, and number nine which is 1-32 of an inch larger.

Two cuts of the stem are required in correct picking, the first leaving the stem about one-fourth of an inch long. With the fruit down before him where he can better see his work, the second cut is made close up to the button. Special fruit clippers are used Pickers are required to place, not drop, the fruit into the picking sack which is carried at the side. By unsnapping the bottom of the sack the fruit is emptied into the field boxes without great chance of injury.

Upon entering the packing house the fruit is run through a washing machine. Cleansing is accomplished by the fruit passing through water, with brushes on all sides. From the washer tank the fruit is carried out on to belts, from which it is graded as to color, dark and light green, silver, and yellow being the usual classes. Most of the cull fruit is removed at this time, also.

The fruit is now ready to be cured in packing house. The time required varies with the grade, or color of the fruit. Dark green fruit, under correct conditions of humidity and temperature, will usually cure in from four to five weeks. The temperature should not be over 70 degrees. The lowering of the temperature and the changing of air is accomplished by ventilation during the cool hours of the night. The humidity may be plenty high enough, around 80 points, in houses near the coast. In the interior valleys it is usually controlled by sprinkling the curing rooms. Correct curing not only changes the color, but produces a thin, tough rind as well.

After being cured, lemons are graded as to soundness, blemishes and general appearance. In the grading process the lemons are placed in trays, one layer deep. From these trays they are packed, the packers doing the sizing as they pack.

FOR EXHIBIT OF FIGS

By Ira J. Condit

AT THE next meeting of the California Fig Growers' Association, which will probably be held shortly after the first of the year, it is planned to have an extensive exhibit of fig products of every description. The number of concerns putting out fig jam, preserves, canned figs, pickled figs, candied figs, etc., is increasing rapidly and a little effort on the part of a committee would result in assembling a very creditable exhibit which would be not only of considerable advertising value to exhibitors but of educational value to all concerned.

It is a well known fact that the California dried fig has in the East a reputation that, to say the least, is not rosy. One well known importer and broker in Chicago wrote as follows in January, 1918: "The Calimyrna fig, we think, in the opinion of the trade at large, compares very favorably with the Smyrna imported fig in quality and by many is preferred because of the assumption that the conditions in the packing plants in California are more hygienic than those existing abroad, The California Adriatic fig, as you know, has a poor flavor and though it is largely used even in some instances for fancy packages that sell at high prices, it cannot, in our opinion ever supplant the imported article except for manufacturing purposes because of its inferior flavor."

Another importer writes from New York City: "Summing the whole matter up in a few words, we would suggest that the growers try to eliminate entirely the smut which unfortunately seems to be a condition in both Adriatics and Calimyrnas and endeavor to produce a fig with a thinner skin and increase the quantity of actual meat contained inside."

There is no room for argument over the need for improvement in the California pack of dried figs. It behooves the California fig growers to see that the Eastern assumption that "the conditions in the packing plants in California are more hygienic than those existing abroad" is based on fact. The truth will out sooner or later if the assumption is not true and the sooner the better for the California growers.

An exhibit of fig products such as contemplated by the Association should attract the attention of every grower and packer in the state. An individual having a single fig tree may have a knack of putting up figs which would show up another similar product in a poor light. If a grower has a mysterious secret process of drying or preserving figs, which he thinks no one else ever thought or heard of before, it is his priviiege to keep the secret or reveal it, but the product is of no value unless it will stand the test of comparison with other similar products.

Plan now while the producing and drying season is on to get an exhibit ready. Any quantity of fruit however small or any exhibit of miscellaneous products however large will be accepted. Get ready now.

FRUIT WORKERS OF CALIFORNIA OFFER UNUSUAL PROBLEM

When you consider that the California fruit pack for this year will have a value of $50,000,000 and that 80 per cent of it all must be handled in eight weeks, you get some idea of the great industrial problem which must be soived in this state," says Catherine Phillips Edson, executive officer of the Industrial Welfare Commission, in an interview with the Sun-Maid Herald, of Fresno.

Minimum wages for dried and green fruit workers of $13.50 a week goes into effect August 20 and in the manufacturing industry the same minimum will become effective September 1. These raises will affect thousands of

NEW Mitchell SIXES

OUR VICTORY MODEL

100 Notable Changes

Why Cars Grow Old

THE pre-war Mitchell was a famous Six — a 14-year development. It won us a world-wide success. Now we have added more strength and endurance. There are larger parts, sturdier parts, better materials. We have used all our experience to give you the ideal, long-lived Six.

See Major Additions

The rear axles are much larger. The steel frame is 1½ inches deeper. The gears are much stronger. And sample gears are constantly broken to insure these new strength standards.

We are guarding against wear. The cylinders are ground to utter smoothness. The pistons are perfectly fitted. Motor bearings are made large. The crankshaft is twice balanced in two new-type machines. Thus we give you motor smoothness that endures.

Engines are tested by dynamometers. Axles are tested by electric apparatus. Transmissions are tested in a sound-proof room. Gears are mated pair by pair. A large staff of trained inspectors guards against the misfits which cause troubles.

The body is a new design. The frame is uniquely staunch. Extra coats of finish give a lasting luster. The new-grade top will stay new. The leather upholstery is filled with interlaced hair, so the cushions keep their shape.

Fuel cost has been much reduced. Fit and smoothness in the motor save power waste. A thermostat controls the temperature of liquids, air and gas. The carburetor intake is twice-better heated.

Unique riding comfort is attained by long cantilever rear springs. And ample tests have proved them unbreakable in use. Driving comfort is attained by a ball-bearing steering gear. Brake efficiency is increased 75 per cent.

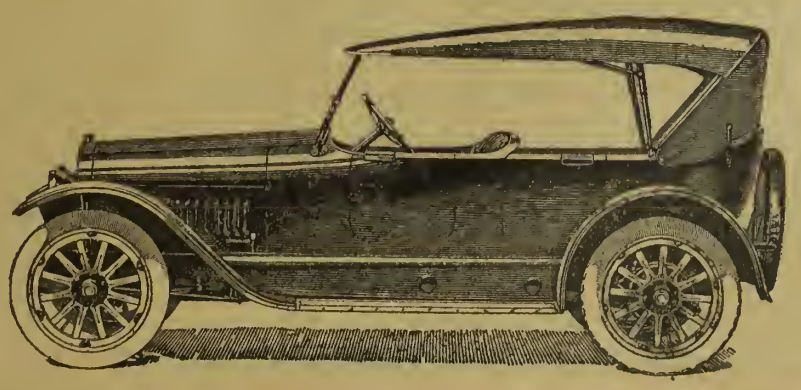
5-Passenger Touring Car
$1690 at Factory
120-Inch Wheelbase—40 h. p. Motor
3 Passenger Roadster, same price
Also built as a Sedan and Coupe.

7-Passenger Touring Car
$1875 f. o. b. Factory
127-Inch Wheelbase—48 h. p. Motor



It Helped Me Get *My* Start

Boys, when I took this place it was a *wreck*—old, worn out fruit trees and land as tight as your fist. Not fifty boxes of fruit in the whole shooting match. Mostly runts at that. I nearly killed myself the first three years cutting old trees, grubbing stumps, and digging holes for my new trees. Went flat broke and things looked pretty blue until I saw an advertisement of

HERCULES DYNAMITE

I sent for a copy of "Progressive Cultivation". Bought some Hercules dynamite and went to it. It was a cinch! You'll scarcely believe it when I tell you that I did more work that Spring with one helper than I'd done in three years with four men and a team—but it's a fact. You boys were youngsters then and didn't know much about it, but *dynamite gave me my start* and it'll help you to keep up the good work. The Hercules Powder Co. sends "Progressive Cultivation" *free* to any farmer or orchardest who will sign and send in the coupon that they print with every one of their advertisements.

900 Santa Fe Avenue, Los Angeles, California

You Want FERTILIZER That Gives the BEST Results

Figure cost per box of fruit, not cost per acre

We are manufacturers of highest grade fertilizers from BEST GRADE Agricultural Chemicals.
We solicit your inquiries for descriptive list and prices of our FAVORITE BRANDS for Oranges and Lemons. Also for Deciduous Trees and Truck Farms.
Our fertilizers are fully guaranteed. Station reports show it is not unusual for our fertilizers to run considerably over our guarantee.
RESULTS obtained with our fertilizer show that lowest prices never buy the best goods. Our prices are right, and cheapest by the crop test.

workers in the state and the September 1 raise will greatly increase California's payroll.

California Pays Best

"California pays the best wages of any state in the Union to this class of workers. This state has the highest minimum. The City of Washington, District of Columbia, has a slightly higher minimum for mercantile workers, but this is the only exception.

"Organization of fruit and cannery workers has reached its highest point in Fresno. I believe the Fresno section is the only big fruit growing area which is thoroughly organized on labor principles.

"In the Santa Clara Valley and in Southern California I have known of instances where women made $40 and $50 a week as expert fruit workers and the compensation for this class of employment is so universally high that our minimum wage of $13.50 is virtually ineffective. No good worker makes so low as that..

"When you consider that the legislature has placed in the hands of five commissioners, of whom I am one, the power to fix the wages of women and girls industrial workers in California, you can contemplate what a tremendous responsibility as well as authority devolves upon us.

Board of Arbitration

"The Industrial Welfare Commission desires to so conduct its hearings and render its decisions that both workers and employers will come to look upon the commission as a fair and just tribunal for arbitration. That we must raise wages is only just in view of the great increases in the cost of living. But California people should on the other hand patronize home industries, remembering that the California manufacturers must compete with the Easterner who has much cheaper labor.

"In 1917 the commission fixed the minimum wage for mercantile workers at $10 minimum, making an increase in the payroll of $660,000 a year. The laundry workers' minimum of $10 was awarded January, 1918, increasing the state payroll by $235,000. July 1, 1919, the $13.50 minimum in the mercantile trade went into effect, spelling another large addition to the amount that companies had to pay their workers.

"Much of our work is educational; not only to educate the employer and the worker on the solution of their problems but to educate ourselves. The commission being new in its duties has to proceed doubly careful.

"Just at the present time there seems to be a great amount of industrial disturbance. This cannot be wholly settled until some balance, some definite relation can be found between a living wage and the cost of living. But the Industrial Welfare Commission can solve the immediate problems, settle the disputes and prevent or cure strikes.

"In Los Angeles one of our educational campaigns has been directed toward teaching the women to spread their laundry out over the week instead of everyone sending their laundry out on Monday and expecting it back on Thursday. By such a method the laundry is busy the first part of the week and has to lay off girls the latter part.

"I think we can expect some national solution of many of our industrial problems through the issues that will undoubtedly come up in the next great presidential fight."

The other members of the Industrial Welfare Commission are Judge Frank J. Murasky, of the Superior Court, San Francisco; Alexander Goldstein, formerly of Fresno and now of San Francisco; A. B. C. Dohrman and Walter G. Mathewson, secretary of the Building Trades Council of San Jose.

Prepare for the Floods

The fires have swept the mountain sides as never before. If these fires are followed by torrents of floods this winter farmers in some of California's rich valleys will be given opportunity to fight the flood waters. An illustration on next page gives something of an idea of the effect of a little flood on rich and productive land. The streak of boulders marks where formerly stood productive orchard trees. One of the best protectors of surface soil is a cover crop. In time of great flood of course even this would be of little avail but for the small torrents which rush from the nearby canyons the binding power of fibrous roots is too well known to need any argument on the part of the California Cultivator but it is in order to remind growers that this is the period of the year when these crops should be started. Give the crop opportunity to get rooted in the warmer fall months. Plant cover crops as never before. A Saticoy subscriber sends the engravings which appear on these pages and he refers to the method of handling the crop in the spring time under what is known as the Kelsey method. In addition to proving a good soil binder he refers to the advantage in heavier bottom land conditions.

"For the past four years one orchardist has chopped up and thoroughly mixed with four or five inches of the soil a heavy growth of barley and burr clover, but has made no attempt to completely cover it as is done in plowing. To do this he uses a five foot disk loaded with about five hundred pounds extra weight and keeps the disks rolled thin and files them to a knife edge each morning.

"As an indication that there is something in this method of farming,

The Kelsey Method of Handling Cover Crop

For the past four years Mr. Kelsey has chopped up and thoroughly mixed with four or five inches of soil a heavy growth of barley and bur clover but made no attempt to completely cover it as plowing would. To do this he uses a five foot disk loaded with about 500 pounds weight and keeps the disks rolled thin and files them to a knife edge each morning. He found this a stock killer and during the last two seasons has used a Ventura made plow.

Devastating Effect of Floods

The binding power of roots in any soil is of great value in time of flood. After the mountain fires of this season there will be abundant need for preventing soil injury from storm waters. Get cover crops planted early that a fine root system may become established.

he has converted a stubborn black soil into a fairly respectable sort of land, and whereas in former years the run-off during rains was very considerable in a former winter of torrential storms the ground absorbed it all. With but twelve trees to the acre—sixty feet apart—he consistently takes off each year a ton or more of number one nuts to the acre."

DAIRY INDUSTRY TO BE FEATURED AT SAN FRANCISCO SHOW

The dairy cow, her products and the equipment necessary in a modern dairy, will make up one of the most attractive divisions at the California International Livestock Show to be held in the California Building at the Panama-Pacific Exposition grounds, San Francisco, November 1 to 8. It will be as complete in the various branches of the dairy industry as the National Dairy Show.

Manager Gordon H. True announces that he has just received word from F. Lamson Scribner, expert on exhibits of the United States department of agriculture at Washington, that upon the close of the National Dairy Show at Chicago next week the bureau of animal industry's exhibit will be shipped to San Francisco. This will make one of the big features of the dairy end of the show as it contains attractive as well as educational features prepared by federal experts working for the advancement of the dairy industry.

A. W. Morris & Sons of Woodland have assured True that they will exhibit Tilly Alcartra, the world's record cow, from their great Holstein herd, and arrangements are being made to have Vive La France, the world's record Jersey, shipped from Oregon. California Gretel, the world's champion milk goat, will complete the trio of world's record milk producers, making perhaps the only dairy show in the country with such a collection of title holders.

As the result of a conference by Dr. C. L. Roadhouse, Sam H. Greene of the Dairy Council, and True, with a number of milk distributors and health officers of the San Francisco bay region, active competition will be brought out in the milk and cream classes, and in addition to this there will be a full showing of the various makes of cheese and butter.

AN IMPORTANT SHORTHORN SALE

H. M. Elberg, proprietor of the Roselawn herd of Shorthorns, believes that the Shorthorn industry of California needs many more females distributed throughout the state in small herds. It is Elberg's idea that only through the establishment of many more herds can the increasing demand for better bulls, originating with the range men of the West, be taken care of. Elberg makes the point that under present conditions by far the majority of the bulls that are used must be purchased in the Eastern states and is certain that the average bull buyer would greatly prefer to buy California raised bulls if enough were produced to fill the demand.

The Roselawn herd, which was originally founded over 30 years ago by W. S. Gibson, has always held a high place in the cattle affairs of the Coast, and for that reason the sale, which will be held at the farm adjoining Woodland on October 16, is attracting much interest. The sale, which is made necessary by a rearrangement of leases, will consist of 45 head of bulls and females, and the entire lot is of a quality that Western breeders have seldom seen. Elberg is putting in a number of his top individuals, in many cases animals that he would much prefer to retain in the herd, which is made necessary in order to reduce his herd to fit his new acreage.

A feature of the sale that should appeal to California buyers is the cataloging of 15 superior females that will sell with calves at foot and bred back again to one or the other of the two herd bulls, Roselawn Champion, junior champion at the 1918 state fair, or Crescent Dale, a grandson of the noted Avondale. Crescent Dale is also cataloged and his selling can be regarded as an exceptional opportunity for breeders and others to secure a bull of outstanding merit.

It is expected that one of the largest gatherings of Shorthorn breeders of the year will be present at the sale.

C. L. Hughes of the California Sales and Pedigree Company, has the details in charge.

GLENN COUNTY SHROPSHIRE BREEDERS ORGANIZE

Shropshire breeders of Glenn County met during the Glenn County fair and organized the Glenn County Shropshire Breeders' Association. The initial membership includes over 20 of the leading breeders of that county. The purpose of the association is to further the production of pure bred Shropshires in Northern California and to arrange for a number of public sales to be held next fall. The following officers were elected: President, W. S. Guilford, Willows; second vice president, Morris Merrill, Willows; third vice president, Frank Glenn, Glenn; fourth vice president, R. B. Moore, Maxwell; secretary, O. L. Raper, Glenn; treasurer, A. J. Morey, Orland; executive committee: A. H. Culver, Morris Merrill, Ernest V. Eibe, A. J. Morey, O. L. Raper, W. W. Foster, M. Fetzer, M. Fortini, Charles L. Lambert, Jr., J. J. Cornwall, J. Johnson, F. B. Glenn, C. L. Leonard, Col. D. A. Shellooe, J. M. Walters, W. P. Dwyer, Van Bernard, H. H. Rawlins, Senator F. W. Lovett, R. B. Moore, W. S. Guilford.

Studebaker

THE LIGHT-SIX

A BEAUTIFUL, clean-cut car of 119-inch wheelbase with plenty of room for five passengers, and a 50-horse-power motor that takes you over country roads at top speed and climbs the steepest grades without effort.

On its mahogany-finished instrument board are conveniently grouped a speedometer, oil pressure gauge, ammeter, lighting and ignition switches; upholstery is genuine leather. Gypsy-type top with plate glass windows in the back.

Its power and staying qualities have been extraordinarily demonstrated in the hands of thousands of enthusiastic owners.

Studebaker builds complete in its own factories practically every vital part of this beautiful LIGHT-SIX, thus reducing middlemen's profits to a minimum and making possible such sterling high quality at its unusually low price.

Heider

15% to 20% Fewer Parts —Years Added to Tractor Life

HEIDER Friction Drive does away with clutch, transmission gears and bevel gears. All three units are in one. Power ordinarily used up by these parts is put into drawbar pull or belt work. Steady, resistless power under perfect control. **Seven speeds forward, seven reverse,** for traction or belt work with one motor speed, one lever. Saves wear because of fewer parts. Easier operation—the simplest drive known. **No transmission gears mean no gear stripping.**

11 Years Actual Field Work

You do not have to take a one or two days' "demonstration" as proof of Heider. America's leading power farmers have been using Heiders for 11 years. Many of the original Heiders are in faithful use today.

Write for our new illustrated catalog of HEIDER, which also describes the famous Rock Island CTX Tractor Plows and the Rock Island No. 38 One-Man Tractor Disc.

Rock Island No. 38 One-Man Tractor Disc

Close-up levers. One man easily operates both tractor and disc.

What Users Are Saying

"I bought a Heider 9-16, with plow attached, last spring and am highly pleased. Would not exchange it for any other." Eugene Sites, Elyria, O.

"Have used my Heider 12-20 for two years; the longer I use it the better I appreciate its value." Henry Adam, Warren, Minn.

"I purchased my Heider three years ago. I farm 350 acres, and if I was purchasing another it would be a Heider." A. L. Barnes, Chappell, Neb.

Rock Island One-Man Outfits

Cover Crops in Tehama County

The following statement of methods in Tebama County appears in the September issue of the "Farm News" published by tbe county farm bureau. We take it that tbis is written by County Farm Agent E. W. Curtis:

Are you planning on a cover crop this winter?

What crop shall be grown?

When shall it be planted?

These are pertinent questions and now is the time to answer them. Numerous orchards in the county already have a heavy winter growth of bur clover and alfilaria, commonly called "filaree." These orchards perhaps do not need a cover crop though tbe growth of these crops is not always certain without seeding.

There are numerous crops grown for cover crops, tbe principal ones being Canada Field peas, common vetch, purple vetch, sweet clover, bitter clover, fenugreek, besides such crops as rye or oats.

By far tbe most desirable cover crops are the various legumes, for, besides furnishing humus to the soil they take free nitrogen from the air and store it in the soil.

Of all leguminous crops grown for this purpose, vetch, bitter clover or Melilotus indica, and purple vetch are probably the best. Common vetch is the oldest and best known though Melilotus indica is at present proving to be a superior cover crop. The indica reaches a heavy tonnage earlier than vetch, thus making it possible to plow it under before the rains cease in the spring.

Melilotus indica has a very extensive root system, six months old plants having shown tap roots that reach a depth of eight feet. In this respect it excels both vetches and cereals.

Melilotus indica is best seeded broadcast and then harrowed in. Irrigation furrows are then made close enough so that the entire surface of the soil will be wet when irrigated. Where the rains do not come early, it is necessary to irrigate to start the crop. About 25 pounds of seed per acre is recommended. From five to 20 per cent of the seeds are hard and do not germinate until the second season.

All legumes bave the power of taking nitrogen from the air indirectly througb the bacteria which are naturally present in the nodules on the roots of this group of plants.

While most legumes will develop to a fair degree without the presence of these bacteria, their development will be much hastened if the bacteria are present. Melilotus indica grows wild over much of the state and is normally well inoculated.

The same bacteria that are found on the roots of common bur clover also inoculate sweet clovers and alfalfa. Where bur clover has grown it is not necessary to inoculate. However where orchards have been clean cultivated for a considerable time the organisms may not be present in sufficient number. On such soils artificial inoculation is desirable.

Use and Waste of Water

Where does the irrigation water go? We know it is applied to the soil for tbe benefit of the crops, but how large a percentage is actually used by the crop is a puzzle, and one of the greatest problems is how to prevent waste after irrigation. It has been estimated that in some cases 80 per cent of the water is lost after its diversion from the stream. Of course a lot of water from every irrigation is transpired by the crop but this we must supply and it cannot be counted as waste.

The heavy losses, as the water goes from stream to field run as follows: Seepage from canals; seepage from field laterals; evaporation from the fields also canals and laterals; seepage downward from the fields. Added to this is the guilt of wilful or careless waste. The heavy loss by seepage in light soils may in part be overcome by the application of no more water than is needed to fill the soil within reach of the plant roots. It is folly to fill the soil where none of it can be recalled. Some of this is hard to control but that lost through evaporation could largely be saved by a little care. The Arizona Experiment Station in a late bulletin (No. 88) gives the following methods available to the farmer, for preventing losses by evaporation.

1. Deep plowing. A shallow seed bed underlain by packed soil tends to cause a high evaporation loss. From seven to nine inches of soil should be turned over by the plow.

2. Cultivation. In the case of crops planted in rows, such as corn, the ground between the rows should be cultivated as soon as possible after each irrigation. In the case of orchards, the ground should be furrowed just before irrigating and cultivated just afterward. If the furrows are six inches in depth, one may expect to save 60 per cent or more of the loss which would occur without the mulch. Even alfalfa needs cultivation at least twice a year, and particularly after the soil has been packed by winter pasturing.

3. Increase in soil fertility. It is difficult to make a mulch when humus is lacking. A fertile soil takes water readily and, if cultivated, retains it with comparatively little loss by evaporation. Straw should be spread on the ground and plowed in. Weeds, trash, and perhaps a green manure crop can be utilized to improve the fertility. All stable manure should be spread and plowed into the soil.

4. More thorough and less frequent irrigation. This practice, besides saving water, tends to establish deep root feeding, while frequent light irrigations encourage shallow roots. For alfalfa one irrigation per cutting is ample except for sandy soils, where two lighter irrigations are preferable.

5. Irrigation at the right time. Irrigate heavily before planting, and withhold water after the planting for a considerable time. In the case of alfalfa, irrigate about a week before cutting. This will supply the water when it is most demanded for plant growth, and after cutting, the ground being still moist, the new crop will spring up quickly and shade the ground. Wheat should be planted in thoroughly irrigated ground, and, with the aid of good winter rains, no irrigation is needed until the boot or flower stage. Cotton should be irrigated sparingly in the early stages of growth.

6. Irrigation at night. Evaporation is much restricted in the night compared with the day time. It is a great mistake to shut down pumping plants each evening.

7. Elimination of weeds. The waste of water to raise weeds should be included with evaporation losses. Weed farming is unprofitable.

8. Windbreaks. They should be planted along the ditch banks and the road sides. Every farmer should raise his own fence posts and fire wood. Wind movement in the Salt River Valley is greatly reduced by the long rows of magnificent cottonwoods with which the landscape is checkered. The nearby fringes of fields require additional fertilization, but tbe net result of the windbreaks is beneficial.

JUNE DROP

Dr. J. Eliot Coit of the college of agriculture, University of California, writes:

"I am just now beginning a tabulation of the results achieved by orange growers in controlling the June drop by planting summer cover crops. We are sending circular letters to all whose addresses we can secure, but there will be many whom we will never hear from. I wish there was some way we could prevail on people who have made trials to write to us of the results, whether successes or failures. We hope to make as complete a tabulation of results as possible, and the results should be ready for publication the first of the year if not earlier."

If citrus growers could realize the real value of cooperation in securing

The New 16 Valve

Twin City Tractor

Pays Big Dividends

For the first time in the history of the tractor industry, the 4 cylinder, 16 valve engine (valve in head type) is now applied to a tractor. The TWIN CITY 12-20 with its 16 valve motor actually develops 25 per cent more than its rated horsepower.

This new 12-20 is a light weight tractor that will out-pull, out-last and out-dividend other tractors of equal rating.

Not built down to a price, but built up to a fixed ideal—to do the work assigned to it better than it has ever been done before.

The highest grade tractor will unfailingly prove the least expensive and pay the biggest dividends.

We wish subscribers to the Cultivator would contribute more liberally of their experiences and aid in gathering together definite and positive information in cultural practices.

THE ECONOMIC LOSS FROM THE MOSQUITO

California owes a large part of her envied reputation among the states to her agriculture and fruit growing industries, and there is possibly no greater source of loss to the farmer and fruit grower than that occasioned by the inroads of insidious malaria, carried and disseminated by the mosquito. This is according to report just sent out by Mr. Hecke's department at Sacramento.

It has been proved that this one feature is largely responsible in retarding the more rapid development of the Southern states wherein, favored by soil and climatic conditions, greater results should have accrued. The actual losses in money from lost time, liability and depleted energy, due to active and latent malaria, are almost beyond the powers of computation.

The approved line of attack to be employed in combating the mosquito is that of oiling, draining or filling in ponds and ditches in which the mosquito breeds.

It is not intended to overemphasize the value of natural agencies such as bats, birds, toads and dragonflies in mosquito repression, for there is no evidence at hand to prove that they materially lessen the number of mosquitoes or modify the degree of malaria in a given locality.

It should be remembered that the mosquito larva lives only in water, and that as small an amount as a teaspoonful in a broken crock or tin can will furnish one domicile in a short time with enough mosquitoes to make the night hideous, as well as involving the danger of sharing your neighbors' malaria through infection. A little oil on the stagnant pond or in the rain barrel will work wonders for when the mosquito larvae rise to breathe the film of oil cuts off their air supply and they die. Figures showing losses to the American nation through the inroads of malaria carried by the mosquito appear so extravagant as to be almost unbelievable. It has been said that the present swarthy dark haired Greek is an example of the insidious working of malaria over a period of several hundred years, for we are instructed by history that the ancient type of Greek was fair haired and light complexioned, whereas the present day type represents that most resistant to the inroads of disease, hence the survival of the strongest.

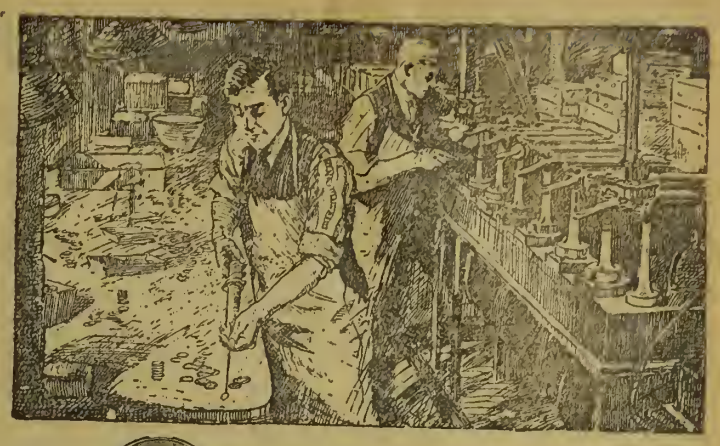
REMARKABLY FINE PRUNES

We have just seen and tested fresh specimens of the "Coates French Prune 1418". It is a remarkably large prune, 10 of the fresh ones weighing a pound (and after some days from the tree), and this we are assured was orchard run and not specially selected specimens. Best of all the size did not result in coarse flesh or a fruit lacking in sugar. On the other hand it is a fine textured sweet fruit. Mr. Coates writes: "The sample is the ordinary orchard run, a remarkable feature in this French prune sport being the almost absolute uniformity in size of fruit. The comparative test, in an orchard of 1000 trees, with this prune in alternate rows with several other types of French, proves conclusively all that is claimed for it. D. W. Strickenbery, Manager Sawyer Drying Plant, reports that it dries even better than the ordinary French prune, being wonderfully firm and heavy. In an orchard this year it bore much more heavily than any other type of same age."

BACK TO NATURE

Old Father Hubbard went to the cupboard
To get his poor self a drink,
But as he drew nigh, the country went dry,
So he got him a drink at the sink.
—Pittsburg Post.

WALTHAM THE SCIENTIFICALLY BUILT WATCH AND THE FOREIGN BUILT WATCH



Know Something About the "Works" in the Watch You Buy

IF you open your watch and examine its mechanism, you will find it consists substantially of two supporting plates, between which is mounted a gearing of meshed wheels to take care of the movement, recording time. This is called the train, which we will speak of in our next advertisement.

The lower supporting plate in a Waltham watch is the foundation upon which every unit revolves and is fixed. It is bored with minute holes to take the pivots, screws, pinions, etc.

This lower plate is drilled and threaded by one of the most exclusive and wonderful machines ever designed by the genius of man—an exclusive Waltham invention from the master-mind of Duane H. Church.

Many operations are accomplished with such methodical, automatic regularity that one instinctively imagines that a marvelous human brain guides the extraordinary operations of this machine.

It makes every operation (and there are 141) with infinitesimal exactness to the ten thousandth part of an inch—flawless, beautiful in its complex simplicity—every plate a replica of every other plate, proving Waltham standardization to be one of the miracles of American mechanical genius.

The plate of the foreign-built watch is subject to the variations of hand process. Made to variant sizes and models without precise relation to the parts which they are to contain, which parts are made elsewhere in many homes and small shops, by hand.

No hand work could ever approximate the beautiful and flawless exactitude of this Waltham drilling and threading.

So when you buy a Waltham watch you are assured of a standardization of quality and leadership which has placed the Waltham watch on the pedestal of world dominion.

This story is continued in a beautiful booklet in which you will find a liberal watch education. Sent free upon request. Waltham Watch Company, Waltham, Mass.

433 CALIFORNIA ST. SAN FRANCISCO

Do You Want $100? Could You Use $50? How about $25?

Well then, put on your thinking cap and submit a name for our finest brand of California Canned Fruits. Remember, we are a co-operative growers' organization and we want a striking, distinctive, easily spoken, easily remembered name, which can be registered as a trade mark.

We are now operating three growers' canneries and expect to extend our operations into every part of California where the growers want to can their own fruit and we intend to make our brand as famous as Sun Maid on Raisins, Sun-Kist on Oranges or Sun-Sweet on Prunes.

For the best name selected we will pay $100.

For the next best name (which we may use as a subsidiary brand) we will pay $50.

For the third neme we will pay $25.

If two or more submit the same name, preference will be given to the one sending in the name first.

If interested in Co-operation, write us and we will tell you all about our $400,000 canneries in San Jose, our plant in Tulare and our plans for further extensions all over California.

More Exhibits at the Demonstration

Owing to the immense number of engravings made necessary by the great tractor exhibit at Los Angeles some of the photos were like passengers who would travel on Los Angeles street cars at the time of the strike—simply crowded off the steps. Those on this page were crowded off last week, but we hope will now serve to call attention to the large number given at that time. The Cultivator always tries to give as graphic report as possible of these educational events.

Union Sure Grip Tractor made by Union Tool Company, Torrance. Demonstration in charge of J. V. Smith, assistant sales manager.

Little Bear attached to cultivator adapted to work under trees. Those standing from left to right are: Walter S. Brush, Harry H. Fouch, C. B. Rhodes. The driver is Harold Brush.

The Stockton, a new tractor manufactured by the Stockton Manufacturing Company. A light weight tractor with a drawbar pull of 1456 pounds according to official tests made by the University of California.

The Toro Motor Cultivator Handled on the Pacific Coast by Douglas Boswell Company. Left to right: S. J. Clapper, president Toro Motor Cultivator Company, Minneapolis, Minn.; Bruce Mitchell, Southern California distributor Wallis and Toro tractor; Douglas Boswell, president Douglas Boswell Company.

The Merry Garden, one of the newer introductions at this demonstration. Fine for the garden and very easily guided.

Demonstration of the National Automotive School. The school occupied a large tent filled with an exhibit of itself educational.

One corner of the tent of B. Hayman and Company. The Roderick Lean Manufacturing Company of Mansfield, Ohio had a most complete exhibit of harrows. The western manager for the company, R. B. Wheeler, whose headquarters are at Salt Lake City, came to Los Angeles to install and oversee this great exhibit.

An automatic ridger and blocker. This was the first exhibition of this feature. The ridger is the same as the regular long used ridger familiar to every irrigator. The two shovels are fitted with trip connected with cord to lever at operator's foot. J. M. Cook was in charge of this exhibit.

Holt 45 Doing Heavy Duty

Land Grader and Leveler. Those standing from left to right are: J. A. Hymer, assistant Los Angeles manager; T. H. Luke, factory sales manager; H. C. Hubbard, the first man to plow, seed and harrow in one operation with a Holt Steamer; Mrs. J. L. Egbert, daughter of H. C. Hubbard; Benjamin Holt, president Holt Manufacturing Company; O. H. Eccleston, assistant factory sales manager; J. L. Egbert; M. W. Hubbard.

Roeding's Fruit Growers' GUIDE

A book that tells you what you need to know (not a catalog)—just issued.

101 pages—142 illustrations—endorsed by the horticultural press and prominent fruit growers everywhere.

You actually have to get this book in your hands and examine its contents to appreciate its real value.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Contract to Buy

A enters into written agreement with B to purchase a lot represented to be forty-five feet by hundred and twenty-five feet and deposits ten per cent of the purchase price under a provision incorporated in the agreement, that if the lot is not of the size stated, B will return the deposit. Upon survey, the lot is found to be forty-four and a half feet by hundred and twenty-five feet; B states that his owner is trying to buy one-half foot from the adjoining property in order to complete the transaction, and refuses to refund money. In case this one-half foot is purchased, would A be compelled to take the lot?—Subscriber, Santa Barbara.

The question is one which upon the more thorough statement of the facts can easily be seen to have two possible answers. The particular circumstances relative to the property might make an answer diametrically different from that which is here given. In the absence of any agreement providing a limited time for the investigation or making time the essence of contract, and in absence of any other circumstances, it would seem that if A receives for the price he agrees to pay, the full and exact amount of land which he agreed to purchase, that the prospective vendor has fulfilled all the obligations and could require A to complete the purchase. It will be necessary for him to do this within a reasonable time however, and if there were disadvantages arising from the part ownership of the other lot, that might decide the question the other way.

Willing of Community Property

Can a wife will one-half of the community property to her children by a former husband without consent of the present husband? If the mother should die, would the children inherit any of the property without will? I put my separate money into the purchase of property which is held in my second husband's name. He has no children. What would be the rights of my children?—Subscriber, Orland.

Under what is termed the community property amendments, the wife would be entitled to will one-half of the community property to the children by the former marriage without the consent of the husband. These amendments have, however, been rendered inactive until after the general elections in 1920 by the referendum. At the present date, therefore, the original rule governs, so that upon the death of the wife, the whole of the community property devolves upon the husband without administration. In the stated case, however, apparently there was separate property at the time of marriage, which the children would be entitled to inherit and might maintain some action to prove it was your separate property. The outcome of such action under the insufficiency of facts stated could not be given with any degree of accuracy.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Pigs Caught Cold

We had three sows to farrow 26 pigs about two weeks apart. Sows and pigs were kept in separate pens until the oldest pigs were two weeks old and were growing fine when we turned them all out together.

The pigs all piled up in a heap and did not suck their own mothers.

We separated them again the best we could but eleven of the 26 sneezed, sniffled and got lame and died. The others seem to have colds but are doing fairly well. We fed them corn, sorghum and separator milk. Some say it was feeding the corn that killed them. What do you think was the cause and what is the remedy?—Subscriber, Bryson.

The pigs must have felt cold to make them huddle together and no doubt did catch cold. Put them in a warm, dry place with plenty of straw. A good cough remedy for them would be syrup of cocillana compound which your druggist could probably furnish you. Half a teaspoon of this twice a day for a few days would probably cure them. Separator milk is not good for pigs or calves. It has air in it and causes indigestion. If the milk was allowed to sour it would be better. Corn is pretty strong feed too while they are so young. Too bad they were not kept right with their own mothers until they were five or six weeks old.

Bog Spavin

I have a large, overgrown colt a little over a year old that has a soft swelling on the front of each hock joint, toward the inside as large as a man's fist. Also some fullness on the sides of the joints. The swelling seems to be just under the skin.

Is it blood or bog spavin? Have used a standard blister without result. What would be the result if I should lance it? He got out with some loose horses several months ago and ran three or four miles which may have cause it.—Subscriber, Artois.

It is bog spavin usually seen in large, overgrown colts and caused by overexertion just as you describe in your colt. Do not think of opening it. It is an oversupply of joint oil and you might about as well shoot him as to let out the joint oil.

Do not overfeed him. Let him get a little thin and harden up. He must have some exercise but not be allowed to overdo.

Blisters and liniment are useless. It will absorb in time and a little iodide of potash internally will help.

Get your druggist to prepare a solution of three ounces of the iodide of potash in a pint of water and give a teaspoon of the solution in the drinking water or on a little feed once a day. This may seem to be a small dose but it is enough.

Closed Milk Duct

I have a cow that has a growth in her teat that feels like a sack that interferes with the flow of milk. The veterinary opened it and the milk flowed freely but now it seems to be closing up although I have used a milk tube to open the hole. Is there any help for it?— Subscriber, Escondido.

There is very little more that can be done for it. Sometimes in healing, the parts that have been cut will draw together more than we want them to but there is no help for it but to cut them again and then they may contract more than before. You might try injecting about a teaspoon of the tincture of iodine into the teat once a day after milking. That would have a tendency to absorb the thickening. Get along without the milk tube if you can as that irritates the parts and keeps up the swelling.

RHUBARB
WAGNER'S IMPROVED
Plant Now Growers making $1000 and over per acre annually. Splendid results in six months. Special prices for immediate planting. Also berries and small fruit, etc. Write to the originator, J. B. WAGNER, Rhubarb and Berry Specialist, Pasadena, Calif

This Month in the Vegetable Garden

Northern California

By A. R. Gould

As was the case last year we were favored with slight rains last month which helped out and acted as a gentle reminder that we were getting near to the wet season which we all hope will give us an above-the-average rainfall, which should bring us great prosperity. Seed collecting from selected types, harvesting root and other crops and preparing plots for next season are the most important duties for this month. In the preparation of plots for the coming season it will be a wise plan to secure farmyard manure in quantity and trench deeply and any decomposed vegetable matter can also be used with advantage. This added to the soil makes all the difference as this organic matter increases the water-holding capacity of the soil which is an all important matter to us in California. The careful study of soil conditions is essential and when we take into consideration the fact that certain organisms which include bacteria are busy working in the soil to keep in circulation the plant foods especially nitrogenous compounds we must do our share to assist. Soil bacteria are the gardener's best friends, they have the power of fixing gaseous nitrogen from the air and changing it into protein, other bacteria then attack the protein and change it into nitrites and so the process goes on in a very wonderful way. Our unseen friends are busy while we sleep improving our soil conditions and as many of the valuable food elements are taken out of the soil by our crops we must return something to aid in the work of reconstruction. Hence vegetable refuse, green manures, etc., are plowed in the soil to advantage.

Collecting Seed

Where desirable qualities have been observed and the grower is anxious to perpetuate them seed should be saved carefully from the types required. It may be corn, melons, cucumbers, tomatoes, squash, or beans. Any of these may be taken care of this month. Keep a record of the type, etc.; it may be very useful in the future.

Peas

It will not be too early to make a sowing of some of the dwarf varieties this month. Little Marvel, Alaska, Nott's Excelsior, are all suitable for the purpose. The ground should be well prepared and the seed sown in rows 18 to 24 inches apart using one pound to 100 feet.

Beets

Thin out the crop sown last month to at least six inches apart in the row. Crowded plants give poor results. Keep the hoe or cultivator at work in the plot between the rows.

Beans

Complete the picking of this crop. The Broad Windsor and Canadian Wonder sown last month will be making headway, especially the last named. Keep these well cultivated.

Lettuce

Transplant varieties White Paris Cos and Los Angeles, sown last month, to rows or trenches well irrigated. Rows should be 18 to 20 inches apart. Big Boston and the other varieties mentioned may still be sown.

Carrots

Those sown last month will require thinning to six inches apart in the row.

Onions

Early varieties White Bermuda, Early Pearl, and California Early Red should all be sown this month and the plot must be richly manured and the surface firm before sowing. Sow in rows 18 to 20 inches apart very thinly.

Cabbage

Plant out the winter varieties we advised sowing last month, Autumn King and American Savoy. There is still time to make a sowing. Transplant sturdy seedlings to irrigated trenches 18 inches to 20 inches apart.

Radish

Winter varieties Long Black Spanish and Chinese Rose Winter should be sown in rows in a deep rich soil.

Tomatoes

Complete the picking of this crop and remove any diseased vines or fruits from the plot.

Leeks

Continue to supply this crop with liquid manure at frequent intervals.

Kale

Another sowing of this useful green feed may still be made.

Parsley

Sow Moss Curled for winter use, later transplant.

Southern California

By D. F. Reichard

This October brings us toward the close of one of the driest seasons Southern California has experienced. The highly developed water and irrigating systems have saved the market gardener but the dry farmer (one who depends entirely on winter rains to make his crops) had very short crops.

During the last 20 years such goodly supplies of water have been developed that there never need be worry about crop failures for those who have lands under pumped water systems.

The things in the garden that have not come to maturity will have to be kept irrigated and cultivated to keep up steady continuous growth. Where crops are matured and harvested, clean up the old plants and trash and burn all that cannot be used for stock feed. By keeping all old plants and litter cleaned up danger of carrying over insects and fungi is minimized. On ground that is not to be replanted at once it would be a good idea to give it a good dressing of manure to be worked in during the winter. For ground that is to be planted right away thoroughly soak even a larger space than is anticipated to be planted so that you will be sure to get it all wet well. Work it up well and thoroughly pulverize. Plant the seed or set the plants at once after the ground is put in shape so as to lose the least moisture possible. Be sure to put water at the roots of plants as they are set, to settle the dirt around the roots.

During October plant seed of Egyptian beets; Oxheart or half long carrots; Round White Six Weeks and Purple Top Globe turnips; parsnips; Early and Winter radishes and salsify in drills and when the fourth leaf is formed thin out so as to give the individual roots room to develop their natural size and shape. Spinach and lettuce are also planted this month. If the spinach is sown at the rate of an ounce to 30 or 40 feet it will not need thinning and will be ready for use in about 75 days, while lettuce must be thinned out to 10 or 12 inches apart. The small plants that are pulled up when thinning may be transplanted and will make heads about two weeks later than that grown directly from seed. Sow cabbage and cauliflower seed for plants to set out for March and April crops. Set out plants started in August, also set out plants of kale and Swiss chard for greens. Plant seed of Early White Queen and the Bermuda onions. It is advisable to sow the seeds of onions in beds and transplant them when they are about the size of a lead pencil into the rows where they are to develop. Put out garlic and onion sets this month for early spring crop.

Plant dwarf and semi-dwarf varieties of peas. The Laxtonian is a new large podded dwarf variety that will mature in eight weeks at this time of the year. The Senator or Admiral is the best semi-dwarf for this season and takes about ten weeks to mature.

The nights are now too long and cold for planting squash, cucumber, corn, melons, or pole beans. Canadian Wonder and Ventura Wonder Wax will develop in warm frostless places.

If sweet potatoes are growing in the garden harvest them before any frost touches the vines. Even the least bit of frost greatly deteriorates their quality. Winter squash and pumpkins should be gathered and stored before nipped by heavy frosts. With the first frost pull up peanut plants and turn over with the roots up and nuts to the sun to cure until they are dry.

A One Man Cultivator With Four Man Capacity

"It Leads the Way"

MERRY GARDEN AUTO CULTIVATOR

THIS handy motor driven cultivator will do the work of four hand cultivators better and easier. It does away with the old method of irksome pushing, pulling, twisting and bearing down. Goes between wide rows and astride narrow ones, working within half-inch of the plants. Driven by its own power, "it leads the way."

Greater Yield

Crops cultivated with the MERRY GARDEN show the greatest yield because best cultivated. It destroys the weeds, works close up to the plants—as near as one-half inch—and breaks up the soil producing perfect protection of "surface mulch." The saving in labor and the increase value of crops will more than pay for the MERRY GARDEN in thirty days.

Better Cultivation

The MERRY GARDEN goes down deep — four to five inches — thoroughly loosening the soil and not merely scratching the surface. It works uniformly without slighting a single row. All soils, no matter how hard baked, yield readily to the action of the MERRY GARDEN.

So Simple a Child Can Run It

The MERRY GARDEN is as simple as it is efficient. Controlled from the handles which are adjustable to man or child. Driven by a 2 h.p. motor and travels from 120 to 200 feet per minute. One gallon of gasoline will operate the motor from 4 to 8 hours. Engine is water cooled; wheelbase 17 inches; wheels 20 inches with 3 inch face. Pulley furnished for portable power purposes. Perfectly balanced and easily handled by man or boy.

Furnishes Portable Power

The MERRY GARDEN serves the double purpose of a cultivator and portable power plant. Simply attach the pulley frame furnished and you have an efficient power plant which will furnish power for the saw, separator, washing machine, churn and other motor driven machines. Pulley frame complete is $10 extra.

Money Back Guarantee

Our rigid satisfaction-or-money-back guarantee protects you fully. This is our guarantee: If the MERRY GARDEN fails to do the work, purchaser in accepting same, agrees to notify us within five days from receipt thereof. We reserve the right to send a demonstrator and if the machine fails, money will be refunded.

Price: $185.00 f. o. b. Cleveland, Ohio. Terms 10% or $18.50 with order. Balance on delivery with privilege of examination subject to five-day trial and guarantee. Shipping weight 250 lbs.

Order Direct

from this advertisement. Just fill out the order blank and mail it direct. If after a thorough 5-day trial you are not satisfied, you will get your money refunded in accordance with the terms of our guarantee. Do not waste valuable time using hand cultivators when the MERRY GARDEN will prove such a profit maker on a "pays for itself" basis.

This Month in the Ornamental Garden

Southern California

By Ernest Braunton

In the "dead of winter" everyone desires some flowers and during the very coldest snaps of cold winters hardly any flowers are available. Even the roses freeze on the bushes and so do nearly all flowers. But there is one that endures, one that may always be depended on. Its name is not Legion, but Calendula.

The family is one of fifteen species ranging from the Canary Islands to Persia, but we are concerned with one only, and its varieites, C. officinalis, native to South Europe. It is the marygold of Shakespeare's time and more commonly known as pot marigold, but it should be called simply Calendula, its only right name. The colors range from a yellowish white to deep orange. The flower-heads are sometimes used for flavoring stews, soups, etc., but we are recommending them for flowers at times when no others are to be had. The time to plant the seed is now, or any time in the next three months. There are some fine named varieties of which Prince of Orange is one of the best. The name Calendula is from the same Latin root as our word calendar and means the same—throughout the months—and Calendula lives up to its name.

Sowing and Planting

Hardy annuals and perennials may be sown now for all will grow readily and with the first rains will develop rapidly. Some of them are: Canterbury bells, centuarea, coreopsis, larkspur, forget-me-not, foxglove, mignonette, pansy, phlox, scabiosa, snapdragon, stocks and the first lot of sweet peas.

If you have on hand or purchase plants of the following, plant them out: Calendula (easiest of plants to handle), cineraria, columbine, pansy, primrose or verbena. This is but a few of the more common, but there are many that are seasonable for October is essentially a planting month on the Pacific Coast. Dealers and growers put in their tree seeds of all kinds this month, and much transplanting is done for it is not cold enough to check growth or warm enough to cause wilting or loss of moisture through rapid evaporation. Thin out the rose bushes of all weak spindly growth and head back any very long slender canes but do not prune heavily until spring; it is too late for fall pruning.

Standard Stocks

Stocks are one of the main winter crops of flowers and may be planted now, either as seeds for later plants or the young plants now ready at the dealers may be set out for early flowers. Stocks are generally of but one form but of many shades of color. They begin with white and lean towards a yellow and stop there. But running toward red and purple or violet we have every shade possible. Next to whites the pinks are most desirable. Stocks are of easy culture and will thrive in any good soil of a friable nature. They are wonderfully hardy and produce good flowers during the coldest days of winter.

Northern California

By A. R. Gould

The dull months are ahead; at least we expect to get cloudy skies and much less sunshine than we have experienced during the last six months. But it is quite possible for us to have a good supply of bloom even in the winter and fortunately we have a wide choice. This month we plan for our winter and spring flowering subjects and the bulb season is also at hand, hence we must look through the list and get the order in. Bulbs will not be quite so plentiful this year for various reasons and it will be first come first served. The same will be true of rose bushes and many other things ornamental. The quarantine laws have shut out most of the foreign grown stock and our gardens must be maintained from home grown supplies. Whether this will put the entomologists out of business and give the nurserymen larger profits is an open question. We do know that those who plan to plant extensively should get their orders in early as there will be a large run on the stock this season. Those who plan to build a home should be careful to have their garden plan worked out to every detail. Plant only those subjects that will be suited to the locality and get the best specimens and place them correctly. There is only one time to do a thing right and that is in the first instance and if this is carefully studied mistakes can be avoided. Study well your exposure and soil conditions. If your soil appears to be poor add plenty of farmyard manure, trench your ground deeply, and prepare it thoroughly before planting. During this month many seeds can be collected, untidy flower beds cleaned off, flowering shrubs and trees manured and dug around the roots, a few subjects can be propagated by root division, etc., and lawns may be re-made and attended to. Seeds of spring flowers may also be sown.

Bulbs, General Selection

Most people are at a loss to know what to order from the bulb catalog, and many of our readers like to add each year to their collection, hence the following remarks on the best varieties may act as a guide which we trust will prove helpful. Among the most beautiful are hyacinths and there are miniatures as well as the large flowering. The former are very fragrant and known as Roman hyacinths. Best varieties are Grand Maitre, lavender; L. Innocence, pure white; Lady Derby, pink and yellow; Hammer, golden yellow. These bulbs, five in number, placed in five inch pots filled with rich soil, will make fine house plants for winter flowering, and as we advise with all pot grown bulbs, they should be placed as soon as planted in the dark for several weeks to encourage root action. A good watering at potting time will suffice. Passing to the larger type the best are Gertrude, pink; King of the Blues; Enchantress, light blue; City of Haarlem, golden yellow; La Grandesse, pure white. These may be planted one and one-half times their depth and the soil should have been well prepared with well rotted manure or a commercial fertilizer such as bone-meal. Hyacinths should be given the best care and attention and spaced four or five inches apart in the rows.

Daffodills and narcissus are among the most popular of bulbs as they lend themselves to planting in so many situations. Planting in the grass, under trees in large groups, naturally provides a wonderful display and these may be left in year after year undisturbed and under good soil conditions they increase very rapidly. The best for the feature just mentioned are Narcissus Poeticus and Poeticus Almira, also the double daffodil Von Sion, and among the singles, Leedsi and Mrs. Langtry. For general garden planting or pot culture we advise daffodil Sir Wotkyn, Golden Spur, Emperor, Victoria, and the largest of all, King Alfred. In the polyanthus group which have several flowers on a cluster the best are Soleil d'Or and Grandiflora. These may be grown in bowls of water filled with pebbles and charcoal.

Tulips come next and there are quite a number of types of these such as early tulips, parrot tulips, cottage or May-flowering tulips, and Darwin tulips which are late flowering and have long stems. They are as satisfactory as any, and we give the best as follows: Clara Butt, Erguste, Farncombe, Sanders, La Tristesse, Rev. Eubank, Inglescombe Yellow. Loveliness, and Europe, early flowering, have rather short stems but they have a range of beautiful colors and Sir Thomas Lipton, Cottage Maid, White Beauty, Ophir d'Or, and Thomas Moore are all good singles. The May-flowering are also worthy of a place and the most popular of these are Bouton d'Or, Gesneriana, Major, Picotee, Fulgens, La Reve, and Ingles-

A Greater Agriculture

OVER 38,000,000 acres were added last year to productive acerage of American farms, in spite of the great shortage of labor. A twenty-billion dollar crop was raised.

The factor largely responsible for this remarkable showing is the farm tractor and power farming machinery. The tractor has given the farm dependable power, requires attention only when in use, accomplishes far more work in less time, and is capable of being used 24 hours a day every month in the year, if necessary.

The part the Hyatt bearings have played in producing this remarkable farm power unit, has been to provide an efficient and life-long protection for axles, shafts and other points of wear. Hyatt bearings make possible the delivery of more power at the drawbar and belt, at a saving of fuel and never require adjustment.

Hyatt bearings are now being used in nearly all of the best tractors built, in threshers, grain-binders, plows and other farm machinery, enabling them to provide a vitally important contribution to the making of a still greater agriculture.

Kings County Fair

By R. P. Royce

WHAT was declared to be one of the most successful fairs in Kings County was held in Hanford, September 22-27. Kings County has had a prosperous year, and the prosperity was reflected in every department of the fair just closed. Exhibits of fruits, grains and live stock representing the best produced in the "Home of Plenty" were as varied and fine as can be produced in any county in California and suggest why Kings County claims to be the "Home of Plenty".

They are real folks living in Kings and they don't do things by halves. The county is famous for so many of the good things that are possible in this state that they are just naturally out to earn the reputation for having the best fair in California, and when Kings County starts after any laurels that might be lying around loose other communities had better take notice.

Perhaps no fair held in California is more deserving of the characterization that it is "A fair for farmers—not fakers". At least the farmers were there and the fakers were not. Kings County turned out en masse and broke all attendance records.

The exhibits in the horticultural hall were varied and complete. Several of the farm centers made highly creditable displays in competition for the prizes offered for the best display of farm products produced in Kings County. Grangeville won first; The Island, second; Lemoore, third; and Corcoran, fourth.

The automobile and tractor and implement show would have been a credit to a fair of much larger proportions.

Live Stock

Keen interest is always manifested in the exhibits of live stock at the fair, and the show this year was a real credit. The Holsteins were represented by the herds of W. J. Higdon, Tulare; Fred D. Ross, Hanford; G. W. Clark, Hanford, and A. B. Comfort, Guernsey; Jersey cattle by the herd of J. E. Thorp, Lockeford.

In the swine department J. E. Thorp had the only exhibit of Duroc-Jerseys, while the following breeders showed Poland-Chinas: M. Bassett & Son, W. L. Haag & Son, John Bernstein, Wm. Bernstein, Fred D. Ross, W. T. Dice, H. D. McCune, C. A. Vaughn, Mrs. C. A. Vaughn, W. D. Trewhitt, H. A. Baily, and A. Buckland & Son. The Poland-China show was remarkable both as to number shown and quality displayed, some classes outranking even the state fair. The keenest competition was in the senior and junior boar pig classes and the senior yearling and senior and junior sow pig classes. M. Bassett won grand champion boar on King's Timm and grand champion sow on Big Model Maid.

J. E. Thorp was awarded all prizes on Duroc-Jerseys. Thos. F. McConnell, San Francisco, was the judge.

The Poland-China awards were as follows:

Aged boar—1, McCune on King's Massive Orange; 2, W. L. Haag & Son on Young Jumbo.

Senior yearling boar—1, Bassett on King's Timm; 2, Buckland on California Jumbo Buster.

Junior yearling boar—1, Bassett on Model Fellow Jr.; 2, Vaughn on Model Jumbo.

Senior boar pig—1, Bassett on Golden Model; 2, Dice on Big Square Orphan; 3, Ross on California Buster.

Junior boar pig—1, Trewhitt on Jumbo Model; 2, Bassett on Gerstdale California; 3, Vaughn on Sam Jones.

Aged sow—1, Buckland on Miss Big Bone; 2, Vaughn on Queen of San Joaquin; 3, Wonder Kings.

Senior yearling sow—1, Bassett on Big Model Maid; 2, Vaughn on Model Maid; 3, Wm. Bernstein on Golden Gate Queen 2nd.

Junior yearling sow—1, Dice on Young Rosehud; 2, Ross on Big Bob's Esther; 3, Dice on Miss Smooth Orphan.

Senior sow pig—1, Bassett on Big Princess Model; 2, Bassett on Big Princess 2nd; 3, Trewhitt on Trewhitt's Mammoth.

Junior sow pig—1, Bassett on Gerstdale Best; 2, Mrs. C. A. Vaughn on Queen 2nd; 3, Bassett on Gerstdale Queen.

Produce of dam—1, Mrs. Vaughn; 2, Buckland; 3, Bassett.

Breeding herd—1, Bassett; 2, Haag & Son; 3, Buckland.

Two pigs under six months—1, Mrs. C. A. Vaughn; 2, C. A. Vaughn.

Grand champion boar — Bassett on King's Timm.

Grand champion sow—Bassett on Big Model Maid.

Dairy Cattle

The show of dairy cattle at the Kings County fair this year was considered by the breeders present the largest and of the highest quality of any in the history of the fair. W. J. Higdon of Tulare won all the championships on Holsteins, and J. E. Thorp on Jerseys. The Holstein exhibitors were W. J. Higdon, Tulare; Fred D. Ross, Hanford; G. W. Clark, Hanford, and A. B. Comfort, Guernsey. The judge was P. B. Thornton, Fresno.

Following are the awards:

Aged bull—1, Higdon on King Korndyke Pontiac 20th; 2, Clark on King Juliana Korndyke; 3, Clark.

Senior yearling—1, Higdon on Model Bonnie Fohes De Kol; 2, Comfort.

Senior bull calf—1, Higdon on Prince Bonnie Walker; 2, Higdon on Prince Walker Bonnie; 3, Clark.

Junior bull calf—1, Higdon on Madrigal Sarcastic Pontiac; 2, Higdon.

Cows—3 years or over—1, Higdon on Model Bonnie Echo; 2, Higdon on Queen Pontiac Burke; 3, Comfort on La Polka Pietertje Piebe.

Two year olds—1, Higdon on Fay Tritomia Hengerveld Walker; 2, Comfort on Meg O' the Mist 2d; 3, Ross on Rossmead Pietertje De Kol.

Senior yearling—1, Higdon on Miss Bracelet Fohes Korndyke; 2, Ross on Rossmead Canary Yorha; 3, Higdon on Bianche Nudine Clothilde Walker.

Junior yearling—1, Higdon on Hengerveld De Kol Segis Cornucopia 2d; 2, Higdon on Miss Tulare Champion; 3, Ross on Rossmead Holland Dot.

Senior heifer calf—1, Higdon on Eloise Ormsby Walker; 2, Ross on Rossmead Wayne Holland; 3, Comfort on Creamelle Juliana Segis.

Junior heifer calf—1, Higdon on Pearle Segis Burke Pontiac; 2, Higdon on Miss Hertinga Pontiac; 3, Comfort.

Senior champion bull—Higdon on King Korndyke Pontiac 20th.

Junior champion bull—Higdon on Prince Bonnie Walker.

Grand champion bull—Higdon on King Korndyke Pontiac 20th.

Senior champion cow—Higdon on Model Bonnie Echo.

Junior champion cow—Higdon on Hengerveld De Kol Segis Cornucopia 2nd.

Grand champion cow—Higdon on Model Bonnie Echo.

The Glenn County Fair

The Glenn County fair, held at Orland September 22-27, stands out prominently as one of the finest examples of what well directed community effort can accomplish and serves in a large way to answer the question as to why Glenn County is forging ahead as an agricultural and live stock center. It takes enthusiasm and cooperation to get results, and they seem to have a large supply of both up in Glenn. The writer knows of no community where a finer spirit exists than was manifested at the recent fair.

The fair was started by a few men who felt that such an exposition would stimulate better methods of production provided that all agencies in the county could be brought together. This they succeeded in bringing about. At least it appeared that everyone was taking a part and playing it will. The farm bureau, the farm centers, the various live stock associations, the schools and the business interests combined to make the fair a success and a real educational institution.

The main exhibit tent was really a miniature replica of the county exhibit building at the state fair. Every foot of space in the large tent was occupied with exhibits covering the entire range of production of the county. Seven farm bureaus had assembled exhibits of a character so unusual as to call forth expressions of pleased surprise from all. The Codora center was awarded first prize, Ord was second and the Capay Rancho center was third. Professor W. L. Howard and Herman Hatfield made the horticultural awards.

The Willows and Orland schools staged complete exhibits of their work, and the keenest sort of friendly competition existed between the two institutions for the beautiful cup offered by Anchorage Farm. The cup was won by the Orland school.

The farm bureau had an extensive exhibit outlining its work, with special emphasis on the service that the

marketing division is rendering. Farm Agent Heileman stated that the business of this department of the bureau amounted to $42,000 during the month of August and that four men are required to handle the work. Heileman said that during the past three months over 20 cars of concentrates were purchased for the members, at a saving of five to eight per cent.

The exhibit of farm machinery was varied and quite complete. Secretary E. S. Kirk said that the attendance was double that of last year.

As was to be expected the show of live stock was one of the outstanding features of the fair. Glenn County has made rapid progress as a live stock center and the growth of the industry was reflected in the well filled barns.

The Orland district is noted for the many high class herds of Jerseys and the exhibit was in every way in keeping with the standing of the breed. A feature of the show was the winning made by M. Fortini, whose herd of three proved quite invincible in the female classes. Several years ago Fortini purchased a heifer from the Embree herd that was dispersed at Orland. This heifer, Noble Peer's Jewel, has quite a show record, having been grand champion at the California state fair in 1914 and at the Oregon and Washington state fairs the same year. She is the dam of the sensational junior champion at the 1919 California state fair, Jewel of Tintagel. She was made champion Jersey female and later was declared the winner of the prize offered for the best cow of any breed on the grounds. Dr. H. W. Hand made a splendid showing with his Keep On herd and was the largest exhibitor.

The awards follow:

Exhibitors: Dr. H. W. Hand, Orland; M. Fortini, Orland; W. G. Gurnett, Orland; John Button, Orland; C. A. Whitsett, Orland; Mrs. C. E. Barrows, Orland; Arthur Erickson, Orland; Hugh Dodd, Orland; J. N. Cook, Orland.

Aged bull—1, Nelson on Dairy Maid's Gay Prince; 2, Cook; 3, Gurnett.

Two year olds—1, Erickson on La Creole Oxfords Ganick; 2, Hand; 3, Button.

Junior yearlings—1, Whitsett on Raleigh's You'll Do.

Senior bull calf—1, Hand; 2, Whitsett; 3, Button.

Junior bull calf—1, Hand on Jolly Boy.

Aged cow—1, Fortini on Noble Peer's Jewel; 2 and 3, Hand.

Three year olds—1, Hand; 2, Erickson; 3, Barrows.

Two year olds—1, Hand; 2, Dodd; 3, Hand.

Senior yearling—1, Fortini; 2, Whitsett.

Junior yearling—1, Hand; 2, Button; 3, Gurnett.

Senior heifer calf—1, Fortini on Jewel of Tintagel.

Junior heifer calf—1 and 2, Gurnett; 3, Hand.

Senior champion bull—Dairy Maid's Gay Prince; reserve, Erickson.

Junior champion bull—Jolly Boy; reserve, Whitsett.

Grand champion bull—Dairy Maid's Gay Prince; reserve, Jolly Boy.

Senior champion cow—Noble Peer's Jewel; reserve, Hand.

Junior champion—Jewel of Tintagel; reserve, Hand.

Grand champion—Noble Peer's Jewel; reserve, Jewel of Tintagel.

The J. S. Gibson Company of Willows made an extensive showing of Holsteins and had easy sailing in all classes except that for two year old bulls, which was won by Guy O. Williams.

For the first time in the history of the show Shorthorns were on exhibit. During the past year a number of new herds have been started in Glenn County as a result of the public sales held by the Butte City Ranch, and it is predicted that within a few years the showing at this fair will be one of the important events aside from the larger shows. O. L. Raper had the champion cow and Dr. Theodora Purkett had the champion bull. Butte City Ranch showed the winning senior yearling heifer that was also reserve grand champion. The same firm exhibited the champion steer. This steer made quite an impression on the cattlemen; he was sired by Victor Stamford and out of a scrub dam, and the result of this first cross told a story that was not hard to grasp and pointed out the possibility of improving the cattle stocks of this state through the use of pure bred bulls.

George Clark made an exhibit of Red Polls.

Professor J. I. Thompson judged the beef cattle and Professor C. V. Castle passed on the dairy breeds.

The swine exhibit included Berkshires, Poland-Chinas, Duroc-Jerseys, Hampshires and Chester Whites.

Anchorage Farm, Orland, was the only exhibitor of Berkshires, but this well known breeding establishment

The Los Angeles Livestock Show

Horse lovers and racing enthusiasts from every section of the United States are expected to be in attendance at the Los Angeles Livestock Show, which will be held in that city from October 18 to 26, as the result of the high class equine display and race meeting that has been arranged under the direction of Judge Ed. R. Smith, the veteran turfman.

In addition to the California horses, which include representatives of the most famous stables in San Francisco, Santa Barbara, Los Angeles and San Diego, Judge Smith has announced that he has received nearly 100 entries from Lexington, Ky., Butte, Mont., Winnipeg, Can., Calgary, Can., Walla Walla, Wash., Gresham, Ore., and Salem, Ore.

The entry lists in the livestock departments of the big show closed September 20, with more than enough entries to crowd the spacious barns and stalls at Exposition Park, to overflowing. The horse show lists will remain open until October 1, and the dog show entries until October 11. The dog show will be conducted by John Bradshaw, the noted canine expert, who has directed some of the most elaborate events of the kind in the country.

Following is the list of livestock and horse entries received by C. R. Thomas, secretary and general manager, to date:

Fred H. Bixby, Long Beach, horses and cattle; S. H. Bowman, Los Angeles, Saanen goats; O. H. Brandt, Sonoma County, Clydesdale horses; Grant A. Brown, El Monte, Jersey cattle; I. M. Burdick, Glendale, Toggenburg goats; Burr Farm, Los Angeles, Holstein cattle; Caledonia Farms, San Francisco, Shorthorn cattle; George Junior Republic, Chico, Duroc hogs, Holstein cattle; Calla Grove Farm, Manteca, Hampshire sheep; Congdon and Battles, North Yakima, Wash., Aberdeen-Angus cattle; Mrs. F. M. Connor, Pasadena, Duroc hogs, Berkshire hogs; L. A. Denker, Saugus, Hampshire hogs; Thomas B. Dibblee Estate, Santa Barbara, Shorthorn cattle; W. H. Dupee, Santee, Guernsey cattle; Fairbanks Ranch, Redlands, Guernsey cattle; Archie E. Ford, Hawthorne, Nubian goats; Falfadale Farm, Perris, Duroc hogs; Frampton Brothers, Artesia, Holstein cattle; C. J. Gilbert, Lancaster, Hampshire hogs; T. S. Glide, Davis, Shorthorn cattle; Gordon and Langdon, Perris, Hampshire hogs; Donald H. Graham, Lancaster, Duroc hogs; Robert H. Gudgeon, Santa Barbara, saddle horses; Hall Brothers, Perris, Percheron horses; F. L. Hall, Perris, Berkshire hogs, cattle, horses; J. L. Hall, Lomita, Poland-China hogs; E. L. Hass, Downey, Jersey cattle; Will Henn, Kansas City, Hereford cattle.

Hereford Corporation of Wyoming, Cheyenne, Hereford cattle; J. T. Hoggins, Fullerton, Toggenburg goats; A. B. Humphrey, Escalon, Guernsey cattle, Berkshire hogs; Minnie B. Kiggins, El Monte, Toggenburg goats; Emma Kraft, Los Angeles, Anglo-Nubian goats; L. Leest, Van Nuys, Duroc hogs; John N. Linden, Los Angeles, Toggenburg goats; Thaddeus Lowe, South Pasadena, saddle horses; George I. Lytle, Perris, Hampshire hogs; John E. Marble, South Pasadena, saddle horses; James Marwick, Santa Barbara, Percheron horses, Guernsey cattle; A. McMinn, Phoenix, Ariz., Ayrshire cattle; Merritt and Bowers, Tulare, cattle and horses, Shetland ponies; J. Henry Meyer, Watsonville, Ayrshire cattle; Keystone Ranch, Lankershim, Duroc hogs; C. D. Miller, La Crescenta, Nubian goats; Belle F. Miller, La Crescenta, Nubian goats; M. L. Montgomery, Simi, Poland-China hogs; E. Avery Newton, Los Angeles, Duroc hogs; J. Francis O'Connor, Santa Rosa, Berkshire hogs; D. H. Ogden, Alpine, San Diego County, Hereford cattle; Pacheco Cattle Company, Hollister, Shorthorn cattle; Mrs. L. O. Rhodes, Pasadena, Toggenburg goats; Margaret E. Rock, Santa Barbara, riding ponies; C. T. Thompson, Bishop, Duroc hogs; J. E. Thorp, Lockeford, Duroc hogs, Jersey cattle; J. E. Wherrel, Riverside, Jersey cattle; Winsor Ranch, Bonita, Duroc hogs; A. J. Stalder, Riverside, Holstein cattle; Charles W. Winter, Alhambra, horses; W. B. Wilson, Lankershim, Toggenburg goats; University of California, Davis, cattle, sheep and hogs; Ireland Ranch, Los Angeles, Duroc hogs; Hewitt Brothers, Van Nuys, Duroc hogs; M. and A. L. Bassett, Hanford, Poland-China hogs; Conejo Ranch, Newberry Park, Hampshire hogs; Duroc hogs, Hereford cattle; Santa Anita Rancho, Santa Anita, Holstein cattle, Percheron and Arabian horses, Thoroughbred horses, jacks and jennets.

Probably no sales attract a larger number of buyers than do those held by the Kings County Poland-China Breeders' Association. Their eighth semi-annual sale of bred sows and gilts will be held in Hanford Saturday, October 11. In this sale will be included a few top boars, as it has become a custom to make such an offering as there are always a few buyers in attendance looking for good sires. The sows and gilts will be bred and every sow or gilt is guaranteed a breeder.

Can an inexperienced man run a billion dollar meat business?

Under the proposed Kenyon bill the packing industry would be placed at the absolute command of a government official who would probably be without practicable experience.

The packers have never been able to hire enough brainy executives of life-long experience to do the work and make the decisions this one man would have to make.

This political appointee will have the privilege of experimenting—with other people's money.

He can try out schemes that may ruin the stock-raising industry—because if the packers suffer, so will the country's livestockmen.

He is to be placed despotically in power over property owned by thousands of stockholders—with the owners getting the privilege of paying for the losses that may occur.

Is this fair to a business it has taken fifty years to build up? Fair to thousands of people who have invested their money? Is it safe, too, for the live stock industry to have the business tampered with by an amateur?

Swift & Company, U. S. A.

Founded 1868

San Diego Hog Show

The big livestock feature at San Diego County fair last week was the hog show. The Winsor Ranch Durocs were there to fill all classes; W. Moore of Fallbrook also showed some fine Durocs; Stirling Spotswood Smith of La Mesa likewise got into the money about right in several classes with his big-type Durocs; C. K. Mitchell & Son of San Diego showed one of the great senior boar pigs.

In the Poland-China section competition centered in two outstanding exhibits; that from the Cloverdale herd at Escondido and that from the County Farm herd. These were the modern day big-type Polands, but a few classes only were filled.

Ringside comment would indicate that next year's swine exhibit at this fair will be three or fourfold in numbers the size of the present one. Mr. R. K. Walker of Winsor Ranch authorizes the statement that there was a larger and keener interest centered in the swine exhibit at San Diego than that shown at Sacramento and Walter T. Gatton, who tied the ribbons at San Diego, emphasized the fact that the aged sow class in Durocs at San Diego outclassed that at Sacramento. The senior boar pig class was likewise a hot show.

Following are the awards in Duroc classes:

Aged boar—1, Winsor Ranch on Winsor's Giant Orion; 2, Winsor Ranch on Great Model.

Senior yearling boar—1, Winsor Ranch on Golden Defender.

Junior yearling boar—1, Moore on Long Model Defender.

Senior boar pig—1, Winsor on Top Sensation 3d; 2, Smith on Pathfinder's Orion; 3, Mitchell on Mitchell's Great Model.

Boar under six months—1 and 2, Winsor on Model Sensation 2d and Model Sensation 1st.

Aged sow—Winsor on Model Defender Lady; 2, Moore on Defender's Ohio Maid; 3, Winsor on Great Lady.

Senior yearling sow—1, Winsor on Miss Pathfinder 12th.

Junior yearling sow—1, Winsor on Model Defender Lady 1st; 2, Winsor on Model Defender Lady 2nd.

Senior sow pig—1, Winsor on Golden Sensation; 2, Smith on Solano Wonder; 3, Winsor on High Sensation Lady.

Sow under six months—1, Model Rose; 2, Model Rose 2d.

Senior champion boar—Winsor's Giant Orion.

Junior champion boar—Top Sensation 3d.

Grand champion boar—Winsor's Giant Orion.

Senior champion sow—Model Defender Lady.

Junior champion sow—Golden Sensation.

Grand champion sow—Model Defender Lady.

Sudan Grass Experiments

Extensive experments for the purpose of determining the relative value of Sudan grass as a forage crop for swine are now in progress at the University of California Farm, Davis, where the grass is being pasture-fed to swine for purposes of comparison with cowpeas, soy beans, and honey sorghum. Comparisons on non-irrigable lands are being made also with the grass as a substitute for alfalfa. Alfalfa is the ideal forage crop for swine where irrigation water is available.
